Let us see now how he makes good his claim to superior knowledge. What dogs has he put himself on record by denouncing? Croxteth, Sensation—and to draw an example from setters—Thunder. Now, all these have been publicly shown to be very superior field dogs. The record of their running can be found in the back numbers of FOREST AND STREAM, together with comments by many sportsmen. Moreover, their qualities have been privately tested by so many persons as to have become notorious. But Mr. Mason says they are ill-formed. Experience and fact say that they must be well formed for their work, else they could not have performed it. It is not to the purpose to say that two of them have been beaten. There probably are better performers in existence, but these are uncommonly good ones all the same. That Maud S. has beaten Goldsmith Maid's time does not prove the Maid to be a slow one. Will Mr. Mason try to evade this logic by saying that he referred to show form? He has no right to do so in discussing the awards at the late show, at least such ones as I was concerned in. When I was called into the ring to take the place of a judge who would, if present, have doubtless given wiser decisions than I could, I was informed by the steward and the other judges that the basis of decisions was to be the best form for field work regardless of "bench show standards."

If that basis was improper, the responsibility should be laid upon those who established it. The judges could not do otherwise than conform to it to the best of their ability. There has been a large class of breeders demanding such a basis for a number of years past, and I think it is well to have made a trial of it, even if more or less error has resulted, which is likely enough, seeing that judges are mere fallible mortals. If errors there are, it is important to have them corrected, and I hope it will be done, for though painful to the vanity of judges, it is for the good of the cause. Meanwhile no would-be authority, who selects for special condemnation such exceptionally good field dogs as does Mr. Mason, can hope to get "solid" with me by applying the flattering title of "Artist of the W. K. C." It would be a pleasant and a profitable title, but I have no right to assume it. I am glad to boast the personal friendship of several members of that club, and also that several of them have thought well enough of my works to buy them. One of them has, as I understand, donated his purchase to the club. But all this is true of several other clubs, and up to the present date I have had no opportunity to enlarge my bank account at the expense of the W. K. C.

I can only hope Mr. Mason's fling may serve to "grease the horse's teeth." Many good judges are being kept out of the ring by the latitude allowed in the press for personal attack. I affirm that an erroneous decision forms no ground for a personal question with the judge. Nor should the remotest hint of such a thing be allowed, save in the case of formal charges of intentional misconduct or collusion, substantiated by considerable evidence.

If a man of great experience and undoubted probity, like Mr. Sterling, consented to act as judge, he is entitled to kind and considerate treatment, and if gentlemen dissent from his opinions they can certainly vindicate their own without going to such extremes as have been witnessed. It is well known that Mr. Sterling and myself differed radically about some of the decisions. Yet, after hearing his reasons, if I continued to differ from him I must own to the possibility that further study and experience may show his views to be correct. I can, at best, claim the Scotch verdict of "not proven" against him, and so, I think, his various opponents will find it if they will temperately consider the matter. Meanwhile, this avalanche of personalities puts us further and further away from what ought to be the goal of all—the truth. JOHN M. TRACY.

Editor Forest and Stream:

In this week's issue the New Haven Kennel Club are credited with having signed the protest against the judging of pointers at the late New York show. To begin with, the New Haven Kennel Club own no pointers, did not show any, and lastly, did not authorize any one to sign any such protest. The club are incapable of showing the discourtesy of "protesting" at another club's judges. We do not like to be "kicked" at ourselves, and certainly would not protest at other shows, especially when we have no cause. By Mr. Mason's explaining how and where he obtained the signature of the club he would greatly oblige G. E. OSBORN,

Ass't Manager N. H. K. C.

NEW HAVEN.

In response to Mr. Osborn's request we wrote Mr. Mason, who replies as follows:

Editor Forest and Stream:

Mr. E. S. Porter, Secretary of the New Haven Kennel Club, told me that he would in the name of his club sign a protest against the judging, which he said was infamous. I did not think it necessary to send the protest on to New Haven for indorsement after getting the word of a gentlemen in Mr. Porter's position. CHAS. H. MASON.

TOMPKINSVILLE, Staten Island.

THE NEW ENGLAND KENNEL CLUB.

THE New England Kennel Club, which was started in this city last March, is now in such a condition that there can be but little doubt of its success. At one of its former meetings a committee was appointed to secure quarters, and as a result of their labors the members were last Friday evening invited to the opening of the club's headquarters, on Tremont street. The apartments are reached by an elevator, and are on the second floor above the street. They are large and roomy, and the main room overlooks the Common and its ever changing panorama. The furniture and fittings are of a dark cherry, with carpets and draperies to match. The walls are tinted, and the whole effect is pleasing and elegant. In one corner is a parlor grand piano, at which any of the music-loving members of the club may while away a few idle moments. As might be expected, there are a large number of dog portraits in the rooms, being from the brush of such artists as Alexander Pope, Henry Smith and W. Beaman. Among these pictures are portraits of Dr. Jarvis's Elcho and Rose; Fay's Coin, the famous Berkley, and Mr. Nickerson's Newfoundland Sam. Dr. F. S. Billings, a member of the Executive Committee, in a short address of welcome, explained the objects of the club and its purposes, which is to have as soon as possible a country house and kennel, where members may send their dogs for breeding, treatment or breaking. The club intends, when it holds its bench show, to give a show, and all prizes will be awarded with reference to merit only. There was a large gathering, many well known gentlemen being present. The club rooms will be kept open until a reasonable hour in the evening, and will be the headquarters for all dog men. HUB.

BOSTON, Mass.

A STREET SCENE.

IT was a pretty picture. The little girl with flaxen hair in profusion about her small head standing on tiptoe putting a letter into a street box on the lamp post at the corner. Her companion, a Scotch terrier, with well-kept, wiry hair, short, stubby tail, wagging with interest in his little mistress' occupation, head on one side as much as to say, "I am mentioned in that letter and I want to see it properly mailed."

While the little miss was struggling with the perversity of the lid, which wouldn't lift high enough for so short a midget as she, a big hulking navvy came along, and without a word, kicked poor doggy with his great hob-nailed shoe into the street with so much force that the poor little fellow was dead ere he struck between the rails of the street cars.

A plainly, well-dressed young man, with a heavy black mustache as his only marked feature, who had stood on an opposite corner watching the little maid and her companion with evident interest, upon the occurrence of the tragedy, stepped quickly across and confronted the ruffian with "Why did you do that?" "You ——," replied the rascal (calling him a brother of the dead animal), "'cause I chose to." "Well," said our young friend, "I choose to avenge my brother's death since you say I am one of his sort," and with this gave him a left-hander which laid him upon his back minus several teeth and a terribly demoralized countenance.

Stepping toward the little one who was now thoroughly frightened, with a few words soothingly spoken, he took up her now motionless dumb companion tenderly in his arms, and with one of the tiny hands of the little maid in his great red hand, soothing her as he went, they passed down the street out of sight.

The miserable fellow who had caused all the trouble looked after them as he held his aching face in one hand and murmured, "Be jabers, I believe it was 'our John' himself."

REIGNOLDS.

BEAGLES.

Editor Forest and Stream:

Seeing in the columns of your valuable paper comments on the "Proper Size of Beagles," written by "Flat" and "Rusticus," I propose to give my opinion as to the proper size of the working beagle and my mode of working them.

I prefer beagles from thirteen to fourteen inches high and say from fifteen to twenty pounds weight. Dogs of this size can stand hard working, and have stronger notes, making a much more lively clash when in full pursuit of their game, and, moreover, dogs of this size can make a rabbit run when started and will not give him so much time to back track and bother the dogs, even in heavy cover.

I can't agree with some of my brother sportsmen when they say "the only way to use the beagle is to shoot the rabbits in front of the little hound."

I moreover say any pack of beagles having their game always shot in front of them will spoil any pack of dogs it is practiced over. They will gradually lose their ambition and perseverance, and on a bad loss of trail will come in and give up. My mode of hunting is to let the dogs run down and catch some of the rabbits on every hunt, and sometimes hunt without a gun, and let the dogs chase and catch their game on fair footing. That gives the dogs perseverance, and makes them press their game, looking for the sight chase and close of race. There is but little amusement in the chase if the rabbit is not made to run; that is the fun when dogs and man are all excitement, and the rabbit is sighted from cover by the little hounds, and the rabbit gradually failing and the dogs well set to their work, and growing more eager at the close of chase. What amusement can there be to only make a rabbit tip along in cover and at first opportunity shoot it? That is to me tame sport, fit for pot-hunters. Dogs must be allowed to mouth their game, and do it by hard work, if you want them to stick and work well. I claim if a pack of beagles can't catch on fair footing a majority of rabbits started, if the cover is not too dense and briery so the dogs can't make a run at them, are not handled properly if well bred. Beagles, like setters, their instinctive qualities can be greatly improved by proper handling. POTTINGER DORSEY.

YORK ROYAL DOG SHOW.

THE Royal York Dog Show's second annual exhibition was held May 31 and June 2 and 3, with a total entry of 708. A great many entries were cancelled owing to some of the classes not filling, which seemed to give general dissatisfaction to exhibitors, who objected to have some of their entries returned and others held, as in many cases the entries returned were the ones they most desired to exhibit and the only ones depended upon winning with. In some cases the committee acted anything but generous, as knocking two classes into one for instance, where dogs and bitches of one variety were offered a separate class in the schedule and the entries in both classes were not satisfactory to the committee, they put the two classes into one. This departure from the general rule also seemed to give rise to a deal of grumbling. The comfort of the exhibits seemed to be very well attended to under the management of Mr. George Hellewell. The judging was got through at a reasonable hour on the afternoon of the first day, owing to plenty of available space to provide rings for all the judges to be working at once. But a scarcity of keepers to bring the dogs into the several rings was very apparent, which could be reasonably accounted for owing to so many rings being filled at once. However, taking everything into consideration, the committee worked well and things went along satisfactory. The weather during the show was everything that could be wished for, but the attendance was very small, and no doubt the result will be a financial loss to the committee.

The first class was bloodhounds (champion) for which there were two entries Nestor, and Lawyer, neither of which put in an appearance. In the next class for dogs and bitches, other than champions, first went to Dorset, a very well made dog, certainly the best in that respect, but not possessing the head, ears or expression of the third prize Phryne, which we preferred to any in the class.

In champion mastiffs Crown Princess was first, beating Cardinal, who was not in as good form as when we saw him at Warwick. The open dog class consisted of Monk, a small brindle, rather long of face, Cardigan also a brindle, rather weak in muzzle, Surajah, good ear and a fair typical dog and The Prince, first at Warwick and first again here, an easy winner. In bitches Mr. Taunton won first and extra prize with Cleopatra; Ilford Claudia, rather light in body, coming second, and her kennel companion coming third. The puppies were a very moderate collection, the winner a good way ahead.

In St. Bernard champions, Ilfreda, looking well, was first. In the open class Glacier, first, we have often described, we preferred the vhc., Faust, to any in the class, but his condition is still against him. Cloister won first in bitches, she is a real good stamp and grand in color and markings; Crevasse II. is rather light in bone; Khiva, a well known winner, showing age; Lady Florence, hc., is typical and of good color and markings, but small. In smooth dogs, Bruce, the winner, is rather short on the leg. Her Majesty, first in the corresponding bitch class, was also winner of first at the St. Bernard Club Show. The puppies were a very moderate collection, none calling for special comment.

In Newfoundlands, first went to Mr. Nichols's Nelson I., looking well, and second to Sultan II., a fair dog, whose appearance is much spoiled by the feather on his tail being quite gray in color; the Landseer Newfoundland Charlemagne coming third. He is a good up-standing dog, much the largest in the class, with a longer and different type of face. Towser, vhc., is small and typical, but was in bad coat. The bitch class was cancelled, owing to insufficient entries, and the three following classes for Great Danes were also cancelled.

In deerhounds, the well-known Chieftain, looking as well as we ever saw him, was at the head of affairs, and no doubt was in his proper position, Lord Arthur Cecil coming second with Glengrieff, a mustard-colored dog.

The well-known Bonny Lass won in champion greyhounds, and was looking remarkably well. The greyhound dog class was cancelled; Messrs. Hill & Aston winning first in bitches with a brindle showing age. Second went to Acalia, a well-known brindle and white.

In champion pointers, Graphic was first, looking in the pink of condition and good health. We consider him the best pointer at present going. In the open dog and bitch class first went to Mr. Shorthose's Quickshot, a good, stylish dog, rather deficient in head properties, and not the color of Mr. Norrish's exhibits; second went to Revel II., who is a little weak before the eye. The well-known liver and white Ruby won for best bitch, the class having been divided. In smallsized pointer dogs, first went to Donald III., a liver and white, with good chest and shoulders, and good all through. He seems rather high on the leg, which gives him an appearance of being rather short in back and stilty. In bitches under 50 pounds, first went again to Mr. Norrish's Beau Ideal, a very nice liver and white. There was a class for field trial dogs and Graphic won quite easily.

In champion English setters, Sting, the winner at Warwick, won first. In the open classes of setters the awards seemed to cause a great deal of dissatisfaction. First went to Royalty, a very fine, strong, well-made dog of good coat and color, but not as sweet in head as we would like him. Second went to Junior Carlton, a lemon and white, very bad in coat and plain in head, and with ears set on too high. Glencaire, third, is a real good dog throughout. The hc., Lord Westmoreland, is another good one, faulty in head, but we fancy him quite as much as the winner, and certainly much more than the second prize dog. The vhc., King Ned, is another good dog. He was rather out of coat. In bitches, Plimsy, who won first, was shown in remarkable good condition, which was more admired than herself. Wild Rose, third, is small and was not in good form, otherwise she was the best in the class. Beauty Queen is plain in head and faulty in coat. Fernie, a lemon and white not mentioned, is a very good bitch and ought to be noticed. Belle of the Isle has remarkably good head and ears, but otherwise was out of form. Bessie IV. is only moderate and faulty in coat. Black and tan setters had not a good one in the class; the winning bitch, Kate IV., was the best of the collection. The Irish setter classes were cancelled owing to want of entries. In the class for field trial setters the curly coated lemon and white Junior Carlton, second in open dog class, and Bessie IV., were placed equal first.

In champion retrievers, first went to Wonder, but we preferred the same owner's Doctor, as showing more quality. In the open dog class, first went to Mr. Skipworth's Smiles, a good young one but rather leggy. In bitches, first went to a young one wavy-coated; second to Jessie; we fancied Mr. Leeson's entry as much as any in the class, she was a little faulty in tail and her name was not given in the catalogue.

In sporting puppies, first and second went to Mr. Bower's spaniel and Mr. Easten's spaniel. As spaniels no doubt they were properly placed, but we think Mr. Hartley's setter, Lord Westmoreland, and Mr. Buckley's pointer, Merry Duchess, ought to have held premier place in this class.

In water spaniels, first went to Mr. Hockey's Lady, who was looking well; second was won by Mickey Free, who was not so good in coat as we have seen him.

Clumber spaniels were a good collection, which were mostly all the property of His Grace the Duke of Portland. The Messrs. Charles's second prize bitch, Foxley Beauty, was looking very well; she is rather short in body.

Sussex or liver-colored spaniels were moderate, the winners all well known.

In black spaniels, champion class, the Messrs. Willets altered their Warwick decisions, where they placed Solus and Roysterer equal first, now placing Solus at the head of affairs, and we think quite correctly. In the open dog class, first went to Easten's Bracken. He is rather thick in skull and shows haw in his eyes. Lord Bute, second, is deficient in character, short in coat and has white on chest. President and Le Role were equal third, the former is too high in legs and the latter has the same fault, with curly coat. The bitches were really good. Easten's Busy is a good specimen, but is out at elbows. Thyra, second, is also a good one, a trifle short in face. Lava Jet, vhc., has white on chest, but otherwise is the best in the class. Coy has her expression spoiled by a lump on her forehead over her eyebrow. Silvia, third, is too fine in muzzle.

Cockers, any color, were a moderate collection. Freda, first, is a mottled colored blue black, white and tan with quite too straight a head. Little Dan is only a puppy and will be quite too large. Nellie VII., by some accident was not taken out of her box until after the judging. She was the best in the class, but is wide in front and light of eye, also short of coat, but is the best stamp of a cocker. In any other variety, first went to Lass o' Devon. She was looking better than we have seen her. In the open class, first went to Easten's Bruce, a liver and tan. He has a good head, is long and low with a good coat, but is not as straight on the leg as we would like. In the corresponding bitch class, Beauty II., first, a black and white of good stamp, but out at elbows. Fanciful, second prize, a black, white and tan, and about the best in the class. Easten's Pride and Zuess were equal third, the latter was rather out of coat. In puppies, first went to Coy, second to Le Roi, both exhibited in the open classes.

Champion collies had four entries, only Donald and Rutland competing, which made it an easy win for the latter, who was not as good in coat as we have seen him. In the open dog class first went to a bluish sable, a good, strong-bodied dog with good coat and head, but rather deficient in carriage of ears, which gives him anything but a showy appearance on the bench. He was, however properly placed. Second was won by a sable, tan and white dog with good face and ears, but light in body and out of coat. Third was a yellow-colored dog, too fine in bone and face. He has dew claws. In bitches first went to Mistress Beatrix, a nice golden sable and an easy winner. Lass, second, is light in bone and fine in face. Oola, third, is leggy, and short of coat. Novelty, vhc., is good in coat, short in back and out at elbows, and walks very badly. In smooth-coated collies we preferred the second prize dog to any in the class. The puppy class was divided into dogs and bitches, the three winning dog puppies were also the three winners in the open dog class. In bitch puppies Glenrosa, first, is fine in bone. Novelty, second, was vhc. in the open bitch class.

In champion Basset hounds, first went to Fino V. Pallas II., vhc., with Theo, in the open class, won the cup for the best pair. In the open class, dogs and bitches, Bourbon first, is full brother to the winner in the champion class.

The champion class for bulldogs had no entries. In bitches, first went to Redowa in the absence of Britomartis, who was entered but did not put in an appearance. In the open class for dogs, Robinson Crusoe, litter brother to Britomartis, won. He is particularly good in head and chop, has a good body and is low on legs. He was not in the condition he ought to be. He also won the cup presented by Spratt's Patent, value £5 5s. The bull bitch class was cancelled.

Dachshunde were a good collection, and, as usual, Mr. Jones's awards were well received.

Champion bull-terriers had no entries. The open class was a moderate collection, and we prefer the second and third to the winner, who is light in bone and hollow under the eye.

In champion fox-terrier dogs Spice beat Climax, whose ears are still badly carried, Sutton Veda winning in the bitch class. In the open dog class first went to Splinter, the Warwick winner, second to Earl Leicester, a remarkably well-made dog with good feet, legs and shoulders, but coarse in head and ears. Dandy Dick, third, is a compact little dog with one ear wrong. In bitches first went to Richmond Nettle, a well-known good one. Delta, second prize, is too fine before the eye. Richmond Patch, third, is a very nice bitch all round, of good size and the best of feet, legs, body and bone. She is rather fine in coat. The winning puppies were above the average, all to be heard of again some day.

The wire-haired terriers were very fair classes, but were faulty in coat. Scarcely two were coated alike, and few among them had the correct wire-hair jacket.

In champion Bedlingtons first went to Dina. Our fancy lay for Topsy. In the open dog class the winner, Bishop, is rather large and coarse. Tinner, third, is of good size, but is too broad in front and carries his tail too high. The bitches were only moderate. The second prize, Domino, we always admired, and think that she has seldom got her dues, and we know many who hold the same opinion. Zulu, third, has not quality enough.

We could not agree with the awards in the Irish terrier champion class. Sting, first, is a bad color and as smooth as a black and tan terrier. Playboy ought, in our opinion, to have won easily, Poppy being absent. The two winners in the open dog class also won in puppies.

Burke won again in black and tan terriers, with a very handsome little bitch coming second to him.

Skye terriers were a good class; Scottish Queen, first, is much the longest and lowest; she would be improved were her ears better carried.

In Scotch terriers, Capt. Mackie had everything his own way, his exhibits standing clear winners from the others, who can't come near them in head qualities or texture of coat.

Dandies had small entries, the winners are all well known. In bitches, second and third prizes were withheld.

The classes for Pomeranians and poodles were cancelled.

In champion pugs we would have preferred Challenger to Jenny. In the open class we would have placed Bradford Ruby first, being better in size, straight on legs, smaller in ear and better color and tail than the winner, who is a little larger in skull. In the bitch class it is only a matter of opinion which of the winners were the best. Only a second prize was awarded in the puppy class.

The classes for Yorkshire terriers and toy spaniels were cancelled. Foreign dogs once more saw Mr. Taunton to the front with our old acquaintance Sir John Frankland, looking well. No less than six prizes were awarded in this class, and only a sum of £6 to be disposed of. There was nothing in the local classes to call for special comment. There was an auction of dogs held on the last day of the show, but nothing good being set up the prices obtained were small, one collie selling for £5 10s., which we consider a very good investment.

Following is a full list of the

AWARDS.

BLOODHOUNDS.—1st, J. Harrison's Dorset; 2d, W. Marshall's Hotspur; 3d, E. Nichols's Phryne.

MASTIFFS.—CHAMPION—J. Royle's champion Crown Princess.—OPEN CLASSES—*Dogs:* 1st, J. Royle's The Prince; 2d, E. D. Tyrer's Surajah; 3d and breeder's prize, W. K. Taunton's Commodore. *Bitches:* 1st and breeder's prize, W. K. Taunton's Cleopatra; 2d and 3d, Capt. C. Dewar's Ilford Claudia and Ilford Charity. *Puppies:* 1st, G. Renton's Guelph; 2d, C. A. Longest's Imperial Chancellor.

ST. BERNARDS.—CHAMPION—ROUGH OR SMOOTH-COATED—H. C. Joplin's Elfrida.—OPEN CLASSES—ROUGH-COATED—*Dogs;* 1st, E. Hodgson's Glacier; 2d, W. G. Marshall's Courage II.; 3d, W. J. Orwin's Storm King. *Bitches;* 1st and cup, W. G. Marshall's Cloister; 2d, L. C. R. Norris-Elye's Crevasse II.; 3d, J. K. Kaye's Khiva. SMOOTH-COATED—*Dogs:* 1st, S. Smith's Bruce. *Bitches:* 1st and cup, G. Porter's Her Majesty; 2d, T. H. Goodwin's Nell Gwynne. *Puppies:* 1st, T. H. Goodwin's Silver King; 2d, J. K. Kaye's Right Hon. W. E. Gladstone; 3d, O. W. Jackson's Hubert.

NEWFOUNDLANDS.—*Dogs:* 1st, E. Nichols's Nelson I.; 2d, H. W. Hart's Sultan II.; 3d, R. W. Moll's Charlemagne.

DEERHOUNDS.—1st, H. C. Joplin's Chieftain; 2d, Lord R. Cecil's Clengriff; 3d, W. Gordon's Beatrice II.

GREYHOUNDS.—CHAMPION—H. P. & P. J. Charles's champion Bonny Lass.—OPEN CLASS—*Bitches:* 1st, Hill & Ashton's Nancy; 2d, H. P. & P. J. Charles's Acalia; 3d, F. Hastie's Meed.

POINTERS.—CHAMPION—E. C. Norrish's champion Graphic.—OPEN CLASSES—OVER 55LBS.—*Dogs;* 1st, J. Shorthose's Quickshot; 2d, C. H. Beck's Prior; 3d, J. Taylor's Earl of Croxteth. *Bitches:* 1st, Lieut.-Col. H. C. Leigh's Devon Wagg; 2d, E. C. Norrish's Revel III. UNDER 55LBS.—*Dogs:* 1st, E. C. Norrish's Donald III.; 2d and 3d, Sir T. B. Lennard's Belhus Hector and Earl. *Bitches;* 1st, E. C. Norrish's Beau Ideal; 2d, T. E. Issard's Ruby of Homestay; 3d, Lieut.-Col. Leigh's Lotus. *Field Trial Class:* E. C. Norrish's champion Graphic.

SETTERS.—CHAMPION—J. H. Platt's Sting.—OPEN CLASSES—ENGLISH—*Dogs:* 1st, J. Shorthose's Royalty; 2d, H. F. Grant's Junior Carlton; 3d, J. Royle's Glengairn. *Bitches:* 1st, J. H. Platt's Flimsy; 2d, T. B. Bower's Bessie IV.; 3d, Major H. Platt's Wild Rose. BLACK AND TAN—*Dogs:* 1st, J. Shorthose's Don I.; 2d, H. R. Gibb's Heather Jock; 3d, H. R. Gibb's Heather Rake. *Bitches;* 1st, R. Chapman's Kate IV.; 2d, W. G. Bottomly's Busy Body; 3d, H. R. Gibb's Bella III. *Field Trial Class:* Equal, H. F. Grant's Junior Carlton and T. B. Flowers's Bessie IV

RETRIEVERS.—CHAMPION—S. Darbey's champion Doctor.—OPEN CLASSES, ANY COLOR.—*Dogs:* 1st, H. Skipworth's Smike; 2d, J. T. Pilling's Falcon; 3d, S. M. Thomas's Silkstone. *Bitches;* 1st, Harding, Cox & E. Jaquet's Black Satin; 2d, Major H. Platt's Fern; 3d, A. Large's Jessie. SPORTING PUPPY, ANY VARIETY,—1st, T. B. Bowers's Le Roi; 2d, A. H. Easten's Busybody; 3d, Harding, Cox & E. Jaquet's Black Satin.

WATER SPANIELS.—IRISH OR ENGLISH—1st and cup, G. S. Hockey's Lady; 2d, J. S. Skidmore's Mickey Free; 3d, G. F. Smurthwaite's Barney Malone.

CLUMBERS.—CHAMPION—Duke of Portland's Fairy III.—OPEN CLASSES—*Dogs:* 1st, 2d and 3d, Duke of Portland's Damper, Dot and Dart II. *Bitches:* 1st, Duke of Portland's Riot; 2d, S. W. Frankland's Rose III.; 3d, Mr Charles's Foxley Beauty. SUSSEX OR LIVER COLOR—*Dogs:* 1st, S. M. Thomas's Guy; 2d, Messrs. Holley Bros.' Horatio; 3d, C. Newington's Laurie.

BLACK SPANIELS.—CHAMPION—J. Royle's champion Solus.—OPEN CLASSES—*Dogs;* 1st, A. H. Easten's Bracken; 2d, J. H. Hussey's Lord Bute; equal 3d, J. K. Kaye's President and T. B. Bowers's Le Roi. *Bitches:* 1st, A. H. Easten's Easten's Busy; 2d, J. Etchell's Thyra; 3d, J. Hill's Sylvia. COCKERS, ANY COLOR.—1st, H. B. Spurgin's Freda; 2d, R. Lloyd's Little Dan; 3d, A. H. Easten's Busybody. ANY OTHER VARIETY—*Champion;* S. M. Thomas's Lass o' Devon.—OPEN CLASSES—*Dogs:* 1st, A. H. Easten's Easten Bruce; 2d, H. B. Spurgin's Counsellor; 3d, A. Heath's Dash. *Bitches:* 1st, J. Etchell's Beauty II.; 2d, H. B. Spurgin's Fanciful; equal 3d, A. H. Easten's Easten Bride and J. Royle's Zuess. *Puppies:* 1st, H. R. Spurgin's Coy; 2d, T. B. Bowers's Le Roi; equal 3d, A. H. Easten's Busybody and H. B. Spurgin's Carol.

SHEEPDOGS.—CHAMPION—S. Boddington's champion Rutland.—OPEN CLASSES, ROUGH-COATED—*Dogs:* 1st, S. Pirie's Kintore; 2d, W. R. Dockrell's The Squire; 3d, J. Pirie's The Scott. *Bitches:* 1st, G. R. Krehl's Mistress Beatrix (late Myra III.); 2d, W. A. G. James's Tawnay Lass; 3d, M. C. Ashwin's Oola. SMOOTH-COATED—1st, W. A. G. James's Lady Help; 2d, J. Royal's Clyde; 3d, W. A. G. James's Gazelle. ROUGH OR SMOOTH—PUPPIES—*Dogs:* 1st, J. Pirie's Kintore; 2d, W. C. Dockrell's The Squire; 3d, J. Pirie's The Scot. *Bitches:* 1st, W. A. G. James's Glenrosa; 2d, J. H. Turner's Novelty.

MISTAKE IN PEDIGREE.—Rosendale, Wis., June 14.—*Editor Forest and Stream:* In an advertisement in your issue, June 12, by Mr. H. C. Miller, Hudson, N. Y., is offered for sale a bitch claimed to be by Croxteth ex Royal Fan. I think there is some mistake in the pedigree of this pointer—three years old. I sold only one bitch from the issue of Croxteth ex Royal Fan, namely, Cora C., who is about two years and six months old. Dolly was not imported. Will Mr. Miller please explain?—S. B. DILLY.

SAN FRANCISCO.—The *Sacramento Bee* announces that a kennel club is being organized in San Francisco. There will probably be no bench show there this year.

PHILADELPHIA KENNELS.—Philadelphia, June 18.—*Editor Forest and Stream:* Your readers who read the communication of "Homo," in your last number, wherein the Philadelphia Kennel Club desires it to be known that it has no connection with the Philadelphia Kennels, may have naturally supposed that the latter was a swindle, and that the kennel of a firm who sell "canary birds, rabbits and ferrets" might be rather a mythical affair. Notwithstanding the fact that the selling of small pets of various kinds is one branch of our business, we have a kennel covering five acres near Angora, Pa., and are endeavoring to build up a business in selling dogs (more especially the non-sporting varieties) on a legitimate basis. The book (the one advertised in your columns) which we mail you with this will convince you that we at least give the biggest ten cents' worth that has ever been gotten out in that line. We find no fault with the club in disclaiming connection with us; that is but natural and perfectly just. The selection of the name, "Philadelphia Kennels," was rather unfortunate on our part, and was done unthinkingly. The only excuse we can offer is that at the time the name was adopted the club was not the active organization it is now, and we did not then see how it was possible for the two names to clash. We desire just here to pay a tribute to the value of the FOREST AND STREAM as an advertising medium. From the little one-inch card inserted four times we have, to date, received 228 replies mentioning the name of your paper. We are so much pleased with the investment that we shall continue it for a year.—ASSOCIATED FANCIERS.

PHILADELPHIA KENNEL CLUB.—It has been decided by the Philadelphia Kennel Club to abolish the black and tan setter class at the coming dog show of the society. At a meeting lately held to draft a premium list and standards for judging, this was unanimously agreed upon, and a motion was made to adopt the Dixon standard for Gordons, which would have been carried had not the president of the club, Mr. J. G. Dixon, objected to it as reflecting upon himself. In justice to this gentleman it should be understood that he was in no manner a mover in this dropping of the black and tan setter class. It was evident to the members of the Philadelphia Kennel Club who attended the late New York bench show that justice was not being done to the breeders of Gordons of straight pedigree when they were compelled to compete in a class where half Gordons and half Irish setters were allowed to enter. Breeders who are devoting their energies to the improvement of this breed should be protected; and it seems to be the general opinion of the management of bench shows in this country that hereafter no black and tan class will be allowed at canine exhibitions. The dates for the holding of the bench show of the Philadelphia Kennel Club will shortly be made known. The special prize list is daily increasing in number and value.—HOMO.

WILD DOGS OF MAINE.—Machias, June 16.—Game prospects for this part of Maine are good. Deer are more plenty than last year at this season, as well as grouse; due to our present game laws, Commissioner Payson Tucker, and the efficiency of the game wardens. If we can retain our present laws and have the same appropriation for the next two years, we shall see still greater changes. But the danger is that the market hunter will overturn the whole, for he cannot bear to see game increase for fear his neighbor may have a nibble. Wild dogs are increasing, but as soon as they can eat meat they will go the way of their fathers. There is not a well-trained dog in all Washington county or a proper kennel. They roam at will, breed, steal, destroy sheep and game, pollute with their filth, endanger men with their teeth and disease; in short, a complete nuisance, producing nothing and destroying much. They are all "yaller" in this part of Maine. I like a well-trained dog that is properly used and kept; but I have seen so much of the natural cussedness of the dog as he exists in Maine, that I agree with others that he is wild, not domestic. In his place he is a luxury, but out of it, a nuisance.—H.

COLLIE SHOW AND FIELD TRIALS.—In connection with the Toronto Industrial Fair this fall will be held under the auspices of the Ontario Collie Club, a collie show and field trials. These will take place on the exhibition grounds Sept. 16, 17 and 18. In the bench show prizes will be given in four classes, each with sub-sections. There will be two sections (dogs and bitches) in the champion rough-coated class, and three sections (dogs, bitches and puppies) in the open rough-coated class. There will be the same classes and sub-divisions for smooth and medium-coated collies. The field trials will probably be for each dog to take sheep between two posts and back to a pen, or such other trial as the judges will decide. There will be two classes (dogs and bitches), in each of which three prizes, $25, $15 and $8, will be given. Further information is to be had from Mr. H. J. Hill, secretary of the Industrial Exhibition.—*Toronto Mail.*

DOGS AND RAILROADS.—The Chesapeake & Ohio and Kentucky Central Railway Companies will "receive and carry free of charge in baggage cars, at the owners' risk, and without checks, bicycles, light equipment of sportsmen, and their game; also one dog free for each sportsman, when accompanied by their owners, holding first-class tickets. Owners to load and unload their own property."

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex,
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Trallee. The Milwaukee Kennel Club's (Milwaukee, Wis.) Irish water spaniel bitch Trallee (Bob—Irish Nell), June 1, seven (three dogs), by their Dan O'Connor (champion Barney—Kathleen).

Irish Nell. The Milwaukee Kennel Club's Irish water spaniel bitch Irish Nell (Patsey—Jess), June 13, five (three dogs), by their Dan O'Connor (champion Barney—Kathleen).

Clio. Mr. H. W. Huntington's (Brooklyn, N. Y.) black greyhound bitch Clio (Badger—Fan), June 11, eight (five dogs), by his Doublehot (A.K.R. 73); two black and white, one black, one blue and one fawn dog, and three black and white bitches.

SALES.

☞ *See instructions at head of this column.*

Sweetheart. Red Irish setter bitch (A.K.R. 299), by Mr. James B. Blossom, Morrisania, N. Y., to the Ashmont Kennel, Boston, Mass.

White Lily. Liver and white pointer bitch, age not given (Dime—Queen), by Mr. S. B. Dilley, Rosendale, Wis., to Mr. C. W. Stewart, Ripon, Wis.

Keno Ranger. Liver and white pointer dog, whelped April 3, 1884 (Ranger Croxteth—Fanny Faust), by Mr. S. B. Dilley, Rosendale, Wis., to Mr. W. C. Percy, Bayou Tunica, La.

Ruby. Red Irish setter bitch, 4yrs. old (Elcho—Rose), by Mr. H. H. Tate, Greensboro, N. C., to Mr. Max Wenzel, Hoboken, N. J.

Dell. White, black and tan beagle bitch (A.K.R. 319), by Messrs. R. & W. Livingston, New York, to Mr. Andrew Winser, Providence, R. I.

Rock—Kate whelps. English setters, age and color not given, by Mr. William Tallman, South Attleboro, Mass., a dog to Mr. W. W. Higgins, Pawtucket, R. I., and a bitch to Mr. J. I. Farrell, North Attleboro, Mass,

Dido. Italian greyhound bitch, age not given (Mayo—Vero), by Mr. E. W. Jester, St. George's, Del., to Mr. W. H. Wilson, Washington, Pa.

Ida. Italian greyhound bitch, age not given (Mayo—Vero), by Mr. E. W. Jester, St. George's, Del., to Mr. George E. Numsen, Baltimore, Md.

Zoo. Italian greyhound dog, age not givan (Mayo—Vero), by Mr. E. W. Jester, St. George's, Del., to Mr. G. E. Stockbridge, Kalamazoo, Mich.

Ruth. English setter bitch, age and color not given (Dashing Lion—Armida), by Mr. E. W. Jester, St. George's, Del., to the Highland Kennel, Ashfield, Mass.

Obo II.—Smut whelp. Black cocker spaniel bitch, whelped April 29, 1884, by Mr. H. C. Bronsdon, Boston, Mass., to Mr. F. McDewell, same place, who has resold her to Mr. Robert Walker, Franklin, N. Y.

Lennox. Lemon and white pointer dog (A.K.R. 1045), by Mr. H. W. Smith, Worcester, Mass., to Mr. Robt. M. Washburn, same place.

Flirt Warren. Black and white English setter dog, whelped Feb. 12, 1884 (Dash III.—Matchless), by Mr. D. A. Goodwin, Jr., Newburyport, Mass., to the Strawberry Hill Kennel, Leicester, Mass.

Flake. Bull-terrier bitch, age not given (Mat—Vixen), by Mr. F. C. Wheeler, London, Ont., to Mr. Frank F. Dole, New Haven, Ct., who has resold her to Mr. Frank H. Howe, same place.

Scarlet II. Bull-terrier bitch, 3yrs. old (Randall—Scarlet), by Mr. Geo. B. Foss, Dover, Me., to Mr. Frank F. Dole, New Haven, Ct.

Scarlet III. Bull-terrier bitch, whelped Feb. 26, 1884 (Young Royal—Scarlet II.), by Mr. Geo. B. Foss, Dover, Me., to Mr. Frank F. Dole, New Haven, Ct.

Sensation—Flirt whelp. Pointer dog, whelped April 11, 1884, by Mr. Wm. S. Thurston, Huntington, L. I., to Mr. A. L. Titus, Centerport, L. I.

Obo II.—Gem whelps. Black cocker spaniels, whelped April 24, 1884, by Mr. Geo. L. V. Tyler, West Newton, Mass., a dog and bitch to Mr. N. P. Warren, same place, and a dog to Mr. George A. Mead, same place.

Black Rose. Black cocker spaniel bitch (A.K.R. 249), by the Surrey Kennel, Ellicott City, Md., to Mr. C. E. Lewis, Suspension Bridge, N. Y.

Success. Black field spaniel dog (A.K.R. 735), by the Surrey Kennel, Ellicott City, Md., to Mr. J. H. Winslow, Philadelphia, Pa.

Growler. Black, tan and white collie dog (A.K.R. 759), by Mr. George A. Fletcher, Milton, Mass., to Mr. David C. Smith, Lexington, Mass.

Rover. Black, tan and white collie dog (A.K.R. 750), by Mr. Geo. A. Fletcher, Milton, Mass., to Mr. Daniel Wheeler, Oxford, N. H.

Jeannie C. Black, tan and white collie bitch (Sandy, A.K.R. 751—Daisy, A.K.R. 748), by Mr. Geo. A. Fletcher, Milton, Mass., to Mr. Chas. W. Cook, same place.

Bruce Ranger. Liver and white pointer dog, whelped Nov. 3, 1883 (Ranger—White Lilly), by Mr. S. B. Dilley, Rosendale, Wis., to Mr. Amory R. Starr, Marshall, Tex.

Nell Ranger. Liver and white pointer bitch, whelped April 3, 1884 (Ranger Croxteth—Fanny Faust), by Mr. S. B. Dilley, Rosendale, Wis., to Mr. David Cratt, Wabasha, Minn.

Minnie Ranger. Liver and white pointer bitch, whelped April 3, 1884 (Ranger Croxteth—Fanny Faust), by Mr. S. B. Dilley, Rosendale, Wis., to Mr. John S. Dilley, Lake City, Minn.

Duke of York. Lemon and white pointer dog, whelped Sept. 13, 1883, by Sensation (A.K.R. 217) out of Lass (Sleaford—Dawn), by Mr. B. F. Seitner, Dayton, O., to Mr. O. B. Brown, same place.

Dandy Sensation. Lemon and white pointer dog, whelped Sept. 13, 1883, by Sensation (A.K.R. 217) out of Lass (Sleaford—Dawn), by Mr B. F. Seitner, Dayton, O., to Mr. A. A. Winter, same place.

Gus Bondhu—Countess Mollie whelp. White, black and tan English setter dog, whelped Feb. 27, 1884, by Mr. P. Moeller, Nyack, N.Y., to Mr. Eugene A. Austin, Providence, R. I.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Obo II.—Gem whelp. Black cocker spaniel dog, whelped Sept. 27, 1884, by Mr. Geo. L. V. Tyler, West Newton, Mass., to Dr. F. E. Crocket, same place.

Rifle and Trap Shooting.

RANGE AND GALLERY.

BOSTON, June 17.—Bunker Hill day brought a crowd of marksmen to Walnut Hill. The scores stood:

Creedmoor Practice Match, possible 50—E. Burleigh 48, A. B. Edwards 47, C. B. Edwards 46, R. Reed 46, W. Daly 44, G. J. Boardman (mil.) 43, F. Wallace 43, M. Wilhams 42, A. Steele 42, C. Smith 41, J. James 41, W. H. Ober 41, G. J. Boardman (mil.) 41, L. Winslow 40, H. Newton 39, Frank Smith 38, F. Wilson 38, W. Jones 38.

Creedmoor Prize Match, possible 50—H. Cushing 47, F. W. Perkins 47, C. H. Cushing 47, J. B. Fellows 46, J. N. Frye 46, J. Armstroug 46, F. Wallace 45, F. Smith 45, W. French 45, F. J. Bent 45, B. Higgins 44, C. Bailey 44, J. Morse 43.

Decimal Match, Rest, possible 100—W. Gardner 95, S. Wilder 90, B. C. Booz 90, B. F. Clark 89, H. S. Sturgis 80.

Decimal Match, possible 100—J. B. Fellows 96, J. Francis 83, H. Steele 66, H. Newton 47.

June 21.—The weather was so warm that but a few gentlemen were at Walnut Hill to-day, but those who were there had an excellent chance to do some good shooting, for the conditions were superb. Messrs. J. P. Bates, R. Reed, E. B. Souther, J. B. Fellows and F. W. Perkins made 47 each on the Creedmoor target, and Mr. W. D. Palmer of the Merrimac Club made a fine 48 and a 47. Mr. J. B. Fellows, who won the Directors' medal, had his twelve-year-old son Fred with him, and the lad made a fine 92 on the rest target. The following are the best scores:

Creedmoor Practice Match.—W. D. Palmer 48, R. Reed 47, C. E. Berry 46, W. H. Ober 45, A. J. Look 45, J. E. Darmoody (mil) 41.

Creedmoor Prize Match.—J. B. Fellows (E) 47, E. B. Souther (E) 47, F. W. Perkins (B) 47, J. P. Bates (B) 47, W. H. Ober (B) 46, C. E. Berry (B) 46, C. B. Edwards (B) 45, J. A. Cobb (B) 45, W. C. Adams (E) 45, A. J. Lock (E) 44, B. A. Lappin (E) 44.

Decimal Match.—W. Charles 88, J. B. Fellows 78, A. J. Look 70, W. H. Ober 69, A. Darling 52.

Rest Match.—W. Charles (E) 93, J. Francis (D) 92, C. Fred Fellows (A) 92, E. B. Souther (E) 79, S. Wilder (A) 75.

Directors' Match, possible 25.—J. B. Fellows 24, J. Francis 23, R. Reed 22, F. Wallace 21.

BUFFALO, June 17.—The ninth annual spring match of the Bay View Rifle Association was shot at their range to-day. The weather throughout the day was exceedingly fine, but the rays of the sun were so bright as to blur the sight on the long ranges. The programme of matches and prizes this year is unusually large, and special inducements are offered to junior marksmen. The work of the day is given below:

Competition No. 1, Directors' Match—Open only to directors of the Bay View Rifle Association. Distance 200yds., rounds 10, position, standing, weapon, any military rifle, entrance fee $1.

Prize—The directors' championship gold badge, shot for annually, and held by the winner during the year; presented to the Association by Brig.-Gen. Edgar B. Jewett, value $25.

Col T S Ward	3	4	3	4	4	4	4	5	4	39
Capt H A Menker	4	4	4	3	2	4	5	4	4	38
Lieut Jas Sheldon, Jr	3	3	3	4	5	4	3	2	4	33
Brig-Gen E B Jewett	0	2	3	3	4	3	4	3	4	30
Capt Wm Franklin	3	3	4	3	4	4	0	0	0	22

Competition No. 2, Qualification Match—Open to all members of the Association, Remington rifle (New York State model), 200 and 500yds., 5 shots at each distance, no sighting shots.

First Prize—A Remington, Keene magazine sporting rifle, presented to the Association by Col. P. P. Beals, to become the property of the person winning it the greatest number of times during the season, value $35.

Competitors divided into three classes, third class allowed to shoot for any prize, second class for first three and last four only, and first class for first two and last three only.

Competition No. 3, Champion Marksmen's Class Match—Open to all members of the N. G. S. N. Y. and members of the Bay View Rifle Association, the latter, however, not being eligible to win the principal prize. 200 and 500yds., five shots at each, Remington rifle (the New York State model).

First prize—A gold marksman's badge for 1884. The badge to become the property of the competitor who, at the close of the season of 1884, shall have won it the greatest number of times. Ten other prizes (medals) presented by the Bay View Rifle Association to the highest competitors in the order of merit. Winners with a score of thirty-six points and over to receive a silver, and winners having a score of under thirty-six to receive a bronze medal. The same man can only win one medal during the season.

The next regular shoot will take place on July 8, when qualification and champion matches will be the order.

THOMASTON, CONN., JUNE 21.—At the weekly shoot to-day of the Empire Rifle Club the following scores were made: A. S. Hubbard 101, W. H. Dunbar 103, G. P. North 101, G. A. Lemmon 99, B. W. Pease 99, F. Carr 87, C. L. Alling, 87, A. Fox 83, C. F. Williams 75, W. Kerwood 74, E. Thomas 71. C. F. Williams's low score was undoubtedly owing to his using a new gun. Holmes, of the Independent Gun Club, of Waterbury, visited the range and made a score of 99. At the shoot a week ago C. F. Williams won the badge with a score of 103, G. A. Lemmon made 102, A. S. Hubbard 101, G. P. North 97, W. H. Dunbar 96, F. Carr 93, C. L. Alling 87, A. Fox 84, B. W. Pease 75, W. Kerwood 75, G Smith 71.

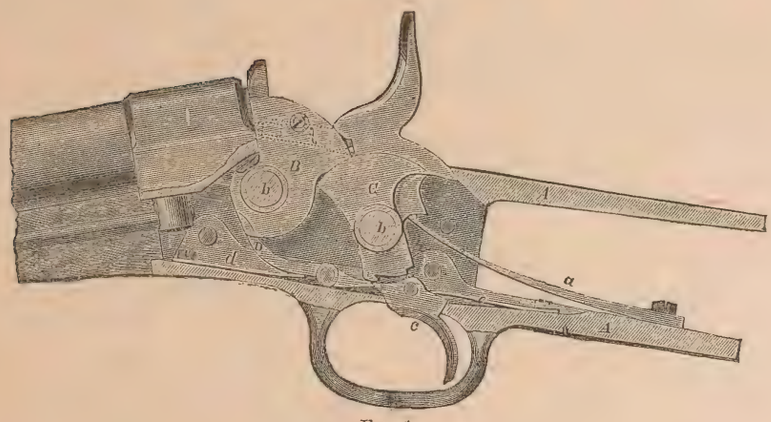

FIG. 1.

RIFLES OF TO-DAY.

THE REMINGTON RIFLE.

THE story of the first Remington gun, the manufacture of which arm, under peculiarly adverse circumstances, laid the foundation of the largest armory in the world, has been many times retold, and will probably be new to but few of our readers. Briefly stated, it is as follows: In 1816, Eliphalet Remington, the founder of the Remington armory, was a boy working on his father's farm in Herkimer county, N. Y. Like other boys, he was very anxious to obtain a gun, but when the subject was broached to his father, he was told to make one. This advice, undoubtedly given in jest, he at once proceeded to act upon, and notwithstanding his tools were of the rudest character and his "plant" consisted of an obsolete farm forge, the gun, when finished, proved such a success, that the young man, although untutored in mechanics, recognized gunmaking as his life work, to which business he thereafter applied himself assiduously.

For nine years he continued the forging of gun barrels, making his father's farm the scene of his operations, and pluckily overcoming the difficulties which the many disadvantages under which he labored, necessarily engendered. In addition to the other work, he quarried the grindstones necessary for his use. Each piece of work was conscientiously performed each barrel added to the reputation of the young gunmaker, and each test of his productions was the means of bringing new customers to his humble factory. The most important part of a gun is the barrel, and there is no doubt that to the reputation for making safe and accurate barrels, thus early established and subsequently maintained, much of the success of the Remingtons may be attributed.

In 1825 Mr. Remington was enabled to purchase the present site of Ilion, N. Y., a few miles from the old forge—his reasons therefore being that he could obtain a better water power, and the Erie Canal having recently been constructed, better facilities for transportation as well. His first venture in building was a modest one-story structure which still stands, forming a part of the forging shop. Space will not permit a detailed account of the progress made in the manufacture of arms, the various improvements in the way of machinery, and the enlargement of the plant. A casual mention, however, may prove interesting. The first contract for making a few thousand stand of arms was undertaken in 1835, at which time, and until 1840, there were but six machines in operation at the works. This contract was soon supplemented by others for 5,000 rifles each, which in those days were no doubt looked upon as important as contracts a score of times as large have since been considered. As his three sons grew to manhood, Mr Remington admitted them to partnership, and having been educated to the business, they at once took a prominent part in its management.

During the succeeding years the Remington arms, in a constant state of improvement, after subjection to the severest tests by government commissions, composed of the best mechanical and military experts, have been issued to troops in every quarter of the globe, placed in the hands of the most intelligent as well as the rudest and most ignorant soldiers, and have invariably withstood the consequent wear, exposure and abuses. There have been made at this armory 1,500,000 stand of military rifles, 100,000 sporting arms, and upward of 600,000 pistols. Military arms have been furnished to the following-named governments, contracts for these guns being consummated by recommendation of the commissions appointed to test the best patterns manufactured; Spain, France, United States (for navy), Egypt, Mexico, Argentine Republic, Denmark, United States of Colombia, Spain (for Cuba), Sweden and Japan. After years of subjection to rough usage on land and at sea, no fault has been found with this weapon, it having successfully withstood that test of tests, active military service. In official reports made by representatives of the different governments which have adopted this arm, the most complete satisfaction concerning its performance is expressed, their recommendations being frequently accompanied with supplemental orders.

Certainly, a weapon capable of withstanding such tests and service is sufficiently durable for use either as a military, hunting, or target rifle. When the Remington rifle is cocked and the breechblock opened, it is impossible to pull it off, as it is furnished with a locking lever, but a pull on the trigger of some of the advertised imitations releases the hammer, which falls to half cock when the breechblock is closed, and if the point of the sear breaks, as it is very likely to do, the gun will be discharged. The function of the locking lever is twofold; one of its offices being to lock the trigger, so that it cannot escape from its notch in the tumbler when the breechblock is opened, and a second to secure the breechblock when closed by the force directly transmitted of the lever spring.

Notwithstanding the improvements made in breechloading rifles and ammunition for many years past, and the attention that has been devoted to their use, it is of comparatively recent date that the range of the arms and their efficiency at long distances have been properly understood. Tests of the Remington military service rifle at a distance of 1,800yds. have resulted in the penetration of two inches of seasoned timber and five inches of solid earth, the charge used being the regular Spanish cartridge, 5 grammes (77grs.) powder and 385grs. lead. The accuracy attained—common military sights being used—fully established the fact that at the distance named a body of troops can easily be driven from any unprotected position. Well authenticated instances are given in which men and horses have been disabled at a greater range than that mentioned.

As an illustration of how work is done at the Remington Armory, we may instance the fulfillment of the French contract, begun in the fall of 1870, and finished in the following spring—155,000 stand of arms having been made and shipped to France within seven months; a rate of production never approached by any similar establishment. On each of the last three days, 1,530 stand of arms were manufactured and 1,300 stand of arms on each of the fifteen working days preceding, in addition to 200 revolvers per day. Referring to this showing, the London *Times* asserted that the combined armories of England could not equal such a production. The Remingtons have filled larger contracts—notably one with Spain for 265,000 stand of arms—but this is their most rapid rate of manufacture, 1,400 workmen being employed.

Figures 1 and 2 are sectional views of the Remington rifle system used in the military service rifle and in the sporting rifles designated as Nos. 1, 1½ and 2. No. 1 varies in weight from 8 to 12lbs., using cartridges of the following sizes: .22, .32, .38, .40, .44, .45 and .50 cal., No. 1½, 6 to 8lbs., .22, .32, .38, and .40cal., No. 2, 5 to 6lbs., .22, .32 and .38cal., either rim or center fire, as may be adapted to same; there being no difference in price of same quality, only in caliber and weight. Figure No. 3 shows a plain sporting gun, many varieties of which are made by the addition of sights and other extras. The system is so well known as to render a technical description of its construction and operation unnecessary.

The Remington target rifles are intimately associated with the history of Creedmoor and other rifle ranges, from the time that Major Fulton led the field by eight points in the first international match, until Sergeant Dolan won the military championship match in 1883, leading all competitors eleven points and beating all former records by eight points, the Remington winning in each instance. Nearly all the expert long-range mark-men in the country use this arm, and it is also shot by some of the principal prize winners at Wimbledon. The annual reports of the National Rifle Association teem with victories won by the Remington, and these are so numerous and this fact is so well understood, that it is not necessary to reproduce them here. It has won more matches than any other weapon and upheld its reputation from the shortest to the longest ranges.

Like the soldier, the hunter requires a gun that is proof against all kinds of exposure. As a reliable hunting weapon, the Remington has an excellent record, all kinds of game being numbered among its victims. It has furnished food and protection to explorers in all climates, from the Arctic regions to Africa, its accuracy and effectiveness remaining unimpaired throughout years of exposure, when far from the reach of gunsmiths. Lieut. Schwatka, U. S. A., whose explorations have given him a world-wide reputation, writes as follows concerning the Remington rifles, used by him during his memorable search for relics of Sir John Franklin:

"In justice to yourselves as generous contributors to my late expedition in search of the relics of Sir John Franklin from 1878-80, I would state that the two rifles furnished by you exceeded my expectations. They were frequently used during temperatures ranging from 50 to 60 degrees below zero and at distances from 200 to 600yds. with perfect working of their parts, and with deadly effect. I consider that on my expedition the arms used were subjected to the severest practical test to which guns have ever been exposed. Compelled to be kept out of doors constantly to avoid the moisture of the igloos, lashed in convenient places for immediate use on constantly overturning sledges, used at a moment's notice under all variations of temperature and weather, the Remingtons never failed us on this expedition, where the lives of nineteen human beings and an average of thirty draft animals depended for over ten months upon the efficacy of our firearms."

The subjoined extract from the journal of Chief Engineer Melville, U. S. N., kept by him during his search for the Jeannette officers and crew, was written, Mr. Melville states, just after shooting a ptarmigan at long range with the rifle mentioned, it having been found and pulled out of the snow where it had lain for months after a long period of careless use by Alexy, the Indian:

March 20.—The Remington gun is the gun of guns. All of our other sporting rifles gave out one after another. We have one Remington that Alexy used for two years, and then it hung out all winter, muzzle up, in snow and storm, and we go on shooting with it as if it came out of the armory to-day."

Gen. Thomas Jordan, speaking of the arms used in Cuba, says: "Nowhere else in active service, in my belief, has any firearm been subjected to such trying tests as the Remington rifles in Cuba, both by Spanish and Cuban troops, taking into consideration the warm damp, corrosive climate and the character of the men who handled them—very often negroes who had never before been used to handling a gun of any sort. The mechanism proved as strong and enduring as it was simple and easy working. Scarcely any sort of hard usage or any degree of moisture impaired its efficiency. Other breechloading arms were in use, both by Cubans and Spaniards, but none gave the same degree of satisfaction. In close observation of the Remington arm, under circumstances daily of the keenest solicitude, when a single firearm in thoroughly effective condition, more or less, was a matter of great importance to me, I could discover no defect in it."

Numberless recommendations like the above might be cited, but these are merely given to show the behavior and satisfactory working of the arm in climates of the opposite extremes.

The Remington armory has five and three-quarter acres of floor space, equal to one room 40ft. wide and 6,210ft., or nearly one and one-fifth miles, long. Machines to the number of 1,760 are driven by a force of 900 horse power, with the aid of 4,900ft. of line shafting and 70,400ft. of belting. The estimated value of the plant, not including either stock or materials, is $2,500,000. It is next to impossible to give an idea of the various styles of arms manufactured, in which are included military, sporting and target rifles, shotguns, pistols and rifle canes; the different patterns of sporting rifles alone, lengths, sights, chambers, etc., considered, being "too numerous to mention."

One feature of this industry is worthy of a special mention, as it undoubtedly exerts a material influence in promoting the efficiency of the arms manufactured by this firm. We refer to the exhaustive experiments continually carried on with the view of deciding questions concerning calibers, rifling, chambering, the proper distribution of metal, and various other points relating to gun manufacture, as well as the correct ammunition for the different styles of guns. Gunmaking is more than a trade in Ilion—it is a science. The places of men grown old in the service are filled by their sons, who, although using the prevailing ideas as a basis, are fully alive to the necessity for continual improvement, and eager to detect any fallacies that may exist. No theory, however plausible, is accepted as correct until actual experiment has proved it to be of practical value.

Ilion has been represented on the battle fields and rifle ranges, as well as in the hunting camps throughout the world. In the principal expositions these guns have always held a leading place, and the men who make them take a pardonable pride in their successes. Many of the gun makers are expert marksmen, as those who have seen the Ilion team on the rifle range will remember. Eliphalet Remington, Senior, the founder of the business, died in 1861. On January 1, 1865, the firm was incorporated, retaining the name of E. Remington & Sons. Samuel Remington, at that time president of the company, died in 1882, the stock being now controlled, and the business managed by the two surviving brothers, Philo and Eliphalet Remington.

As a fitting conclusion to this article, an extract from an editorial in a former issue of this journal is appended: "It was the assurance from the Remingtons that a rifle could and would be prepared in time for the opening contest which led to the acceptance of the first Irish challenge in 1873, and from that time on, at considerable inconvenience and loss in a purely business point of view, the entire appliances of the Ilion armory have been at the disposal of American riflemen when trials on the range led them to think that certain changes in rifles and fixings would bring about better scores. Full credit has not always been given for these efforts to second the men who give time and labor to practice before the butts. The whole record of American victories on the ranges here and abroad would have been a series of defeats but for the rifles sent out by the Ilion armory. Without going into the well-known story of these favorite rifles in the hands of a dozen foreign armories, the fact is now more than ever brought home to those who feel a patriotic pride in American successes that much of the credit of what has been done since 1873 properly belongs to this energetic American arms manufactory."

TORONTO, June 17.—Guelph vs. Toronto. An interesting match was fired by the above associations to-day. Ten men a side, at 200, 500, and 600yds., 7 shots at each. Position—Kneeling at 200; prone at 500 and 600yds., military rifles. The meeting took place on the Guelph ranges, and resulted in a victory for the Toronto by 70 points. The shooting was good considering the day, which was hot and bright, and a variable wind, making things difficult for the riflemen. A return match will be fired soon on Garrison common.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE CLAY-PIGEON PUZZLE.

Editor Forest and Stream:

"B.," in your issue of June 12, puts some queries well and to the point. I have, with him, wondered how so many clay-pigeons get away. Of course we all know—

First—That it is possible to miss them clean.

Second—That they get out through a hole in your "pattern."

Third—They are frequently hit but not broken. They do not present much of a target; not near as much as a bird on the wing. I doubt very much that any given system of loading or holding would surround these difficulties. In field shooting we often miss very easy shots. To pool all the conditions of man, gun, powder, shot and bird and make them work together every time, "cannot be did." TEXAS.

GALVESTEN, Tex.

THE KNOXVILLE TOURNAMENT.

SECOND annual tournament of the Knoxville (Tenn.) Gun Club. Match No 1, first day, purse $200; 10 single clay-pigeons from 5 traps, 18yds.:

W S Perry	1111111111—10	A E Mead	1111011001— 7
Wm Jenkins	1111111111—10	S B Dow	1011010110— 6

C. C. H.

MASSACHUSETTS STATE TOURNAMENT.—Wellington, June 17.—The fifth annual summer tournament of the Massachusetts State Glass Ball Association was held at Wellington to day, and the participants represented every club in the State. The result of the shooting was as follows:

First event, 7 balls, 25 entries—Webber, Moses, Ball, Rowe and Carson divided first, Plympton, Barrett, Bragg, Keith and Hall divided second, Barney, Lander, Griffin, Hatch and Davis divided third, Spofford, Braley, Plympton, Nichols and Field divided fourth.

Second event, 7 birds, 25 entries—Keith, Davis, Bagg, Moses and Frost divided first, Rowell, Noyes, Barrett and Webster divided second, Spofford, Allen, Hall, Webber, Mayott and Hatch divided third, Reneaud and Adams divided fourth.

Third event, 5 birds, 33 entries—Perry and Davis divided first, Bartlett, Law, Ricker, Reneaud, Souther, Stanton and Smith divided second, Bancroft, Rowe and Nichols divided third, Evans, Merrill and Griffin divided fourth.

Fourth event, 5 birds, 3 traps, 21 entries—Holden and Keith divided first, Evans, Davis, Smith and Rowell divided second, Jones third.

Fifth event, individual subscription match, 10 single balls, 5 prizes, 64 entries—Moses, Bagg, Schaeffer, Hall and Landler divided first, Barrett, Whittier, Tidsbury, Rice, Evans and Barney divided second, Russell third, Webster, Rowell, Smith, Moore and Holden divided fourth, Kensard, and Howard divided fifth.

Sixth event, grand champion contest for the individual gold badge of the Association, 15 single balls, 63 entries—Clark first, Howard, Gilman, Hall, Law, Packard and Plympton divided second, Bagg, Schaeffer and Webber divided third, Davis and Frost divided fourth, Jones and Bartlett divided fifth.

Seventh event, individual subscription match, 7 single clay-pigeons, 5 prizes, 65 entries—Clark, Francis, Davis and Rowell divided first, Reneaud, Holden, Jones, Bartlett and Field divided second, Eager and DeRochmont divided third, Gilman, Barret and Robinson divided fourth, Russell, Evans and Arnold divided fifth.

Eighth event, three-man team match, 5 single clay pigeons per man, 4 prizes, 16 teams entering—Worcester team, Smith, Houghton and Clark first; Worcester team No. 2, Perry, Eager and Holden second; Springfield team, Moses, Bagg and Keith, third; Massachusetts team, Evans, Robinson and Sawyer fourth.

Ninth event, championship contest for the team gold badge of the association, open to one team of five men from each club belonging to the association, 10 balls per man, 8 entries. The two leading teams were as follows, the Worcesters winning the badge for the year.

Worcesters.		Springfields.	
Eager	1111111111—10	Moses	1100110110— 6
Davis	1111111011—10	Barrett	1110111111— 9
Webber	1111111001— 9	Bull	1111111011— 9
Whitter	1111111101— 9	Bagg	1110111111— 9
Clark	1111111111—10—48	Keith	1111111101— 9—42

Tenth event, individual subscription match, 5 pairs clay-pigeons, 5 prizes, 42 entries—Eager, Dickey, Clark, Smith, Holden and Sawyer divided first, Hart and White divided second, Schaeffer third, Wilbur and Law fourth, Spofford and Rice divided fifth.

On the 18th the regular Wellington matches were held and liberally patronized.

THE DISPUTE ADJUSTED.—It is said of the late Senator Nye of Nevada, that he would demolish a two hours' speech of an opponent with a two minutes' story which could not be met with facts nor argument. This was well illustrated at the Exeter, N. H., Club, June 12. A dispute arose whether a bird was scored or lost, and opinions flowed in thick and fast. The judge was evidently lost, if the bird was not, and things looked a little squally, when P. of the Worcester, Mass., Club, who never gave much attention to the classics, but who is fond of using big words, and withal, is a right good fellow and splendid shot, rose from his seat where he was chatting with J. of the Exeter Club, concerning their recent shoot at Chicago, and raising his voice above the din of words exclaimed, "Say, you fellers, don't disintegrate that judge there!" This was too much, and while the rain came down in torrents, and the "boys" roared, the judge found his bearings, and, thanks to P., everything was again lovely.—CLAY-BIRD.

BOSTON June 17.—The Independent Gun Club held a shoot on their grounds at Cliftondale to-day. The winners are named in their order; First event—7 balls, rotary trap: Chaffin, Hedenberg, Willis, Hatch. Second event—Miss and out: Hedenberg. Third event—5 balls, straightaway: Blinn, Chaffin, Hatch. Fourth event—7 balls, rotary trap: Gray, Willis, Blinn. Fifth event—5 balls, incomers: Hedenberg, Chaffin, Willis. Sixth event—Team match, 5 balls: Gray, Chaffin, Blinn, Kelley, McKay, first; Hedenberg, Willis, Gates, Hatch, Tuttle, second. Seventh event—5 balls, rotary trap: Blinn, Gray, Hedenberg. Eighth event—Miss and out: Gates. Ninth event—Match for club badge: Gray. Tenth event—Challenge match: Chaffin defeated Gates. The next regular shoot occurs July 4.—NIXEY.

NEW ORLEANS, June 18.—This evening a number of sportsmen assembled on the prairie near Marengo street, for the purpose of taking part in the bat shoot for the "Scooler Trophy." The attendance would have been much larger but for the rain and wet condition of the ground; however, there was an abundance of fresh breeze, and all participating in this cheap amusement found it a delightful pastime and one worth taking advantage of. A great deal of skill was required to kill the birds, and the shooters with good scores had reason to be proud of their prowess. The bat contest first took place. Twenty bats were shot at in doubles at 25yds. rise. The scores made were as follows:

Bickham	00	01	00	01	10	00	11	01	11	01—	9
Scott	01	00	00	00	10	10	10	00	00	00—	4
Febiger	01	11	00	10	00	10	10	10	10	10—	9
Cucullu	00	01	01	11	10	00	00	11	10	11—10	
Eustis	01	01	00	11	10	00	00	11	00	99—	7
E Druet	01	00	11	00	10	11	11	10	11	10—12	
Dupre	00	00	00	10	10	10	00	11	10	10—	7
Carleton	00	00	00	10	11	01	00	10	00	00—	5
Landry	01	01	00	10	10	11	10	00	00	00—	7
Renaud	01	01	10	11	10	11	10	10	11	10—13	
Brodnax	01	01	00	11	00	10	10	10	11	10—10	
A Druet	01	01	10	10	11	11	10	11	11	11—15	
Davis	00	00	11	10	00	10	00	11	00	10—	7
Born	11	00	00	00	00	11	11	10	10	10—	9
Geneste	11	00	00	00	10	11	11	11	10	10—12	
Moret	01	10	11	10	00	10	11	10	00	00—	9
Louis	10	00	11	10	10	10	11	00	01	11—11	
Buckly	10	00	00	00	10	00	00	00	10	10—	4
Alvord	00	11	10	10	11	10	11	10	10	00—11	
Scooler	11	10	11	10	00	11	10	00	10	00—10	
Troy	10	10	10	10	11	10	00	10	00	00—	8
Cardona	00	00	00	01	01	00	—	—	—	—	2

A sweepstakes was then indulged in, as follows:

Troy	10 10 10 10 10—5	Scooler	10 10 00 00 00—2
E Druet	11 10 10 10 10—6	A Druet	11 10 00 10 11—6

Bickham	10 10 11 11 00—6	Born	10 11 00 11 00—5

PORTLAND, Me., June 18.—The fifth competitive shoot for the Ligowsky medal came off at Topsham yesterday, between the Riverside Club, of that place, and the Willard Club, of Portland, resulting in a victory for the Portland team by a score of 76 to 70. The day was very warm. Directly after the match terminated the Willard Club received and accepted a challenge from the Androscoggin Club, of Lewiston, which will be contested on the ground of the Willards. Below is the official score:

Riverside Club.	Singles.	Doubles.
A Q Goud	0111201011— 6½	1010011111—7—13½
C Keyes	0021100010— 3½	0011110010—5— 8½
G H Goud	1022011111— 7	1111011000—6—13
M C Hall	1101111110— 8	1011111111—9—17
A S Alexander	1111111111—10	1111001111—8—18 —70
Willard Club.		
George H McKenney	1111211111— 9½	1111111010—8—17½
R G Hall	1111110111— 9	1011010111—7—16
W F Todd	1211211111— 9	1101111110—8—17
George H Pierce	0001111011— 6	0100100000—2— 8
E C Farrington	1111111112— 9½	1011101111—8—17½—76

EMERALD GUN CLUB.—Match at 8 birds per man; W. Glaccum 30yds., H. Otten and J. Glaccum 25yds.; the rest 21yds.:

M W Murphy	11110111—7	L H Veimeister	01100001—3
W Glaccum	11111110—8	J Howard	11011001—5
H Veidt	01100111—5	Counselor Cody	11111111—8
J Measel	01111111—7	J P Conner	01110111—6
H Otten	11111011—7	J Mackin	11000011—4
H Mackin	11000101—4	N Measel	11111011—7
Dr Hudson	1 001101—4	J Fisher	11111100—6
P Keenan	00010 1 1—4	J W Godfrey	11111111—8
J Glaccum	11101111—7	W Turner	01101111—6
B Lynch	01111101—6	C Measel	11101000—4
C M Grainger	11011111—7		

Ties on 8, miss and out: Cody 2, Godfrey 1. Ties of 7: Measel, Murphy and J. Glaccum 0, Ottten 11100—3. Grainger 11101—4. Ties on 6: W. Glaccum 0, Lynch 4, Conner 2, Fisher 3, Turner 3. Counseller Cody won the gold medal or first prize. C. M. Grainger won second prize or $10 in gold. Bart. Lynch won silver medal or third prize. The officers of the club are Dr. George V. Hudson, Pres.; John Glaccum, 1st Vice-Pres.; John Measel, 2d Vice-Pres.; M. W. Murphy, Treas.; John Guilfoyle, Sec.

WINCHENDON, Mass., June 18.—The Winchendon G. C. had a clay-pigeon and glass-ball shoot at their grounds to-day, resulting as follows:

Clay-pigeons.		Glass-balls.	
F F Hopgood	8	J Southerland	7
F E Monn	8	F S Davis	6
J Southerland	7	L F Martin	4
L F Martin	7	G S Loud	3
F S Davis	6	F F Hopgood	1
F M Brown	5		

The new Holden trap was used for the first time, and the balls being thrown with so much force will account for the small score.

BOSTON, Mass., June 19.—Yesterday was the regular fortnightly shotgun day of the Massachusetts Rifle Association, and a liberal number of members and their friends from neighboring clubs, who were not ambitious to compete for honors at the State Association tournament being held at Wellington, assembled at Walnut Hill and participated in one of the most enjoyable day's sport of the season. Many and varied were the events indulged in, several of which, especially the "walk up" matches, affording the contestants ample delight and satisfaction. Another especially pleasing and agreeable feature of the occasion was the delightful and refreshing breeze that made outdoor sport at Walnut Hill—which, by the way, is one of the most wholesome, charmingly rustic and picturesque playgrounds in New England—particularly enjoyable to those who had the good fortune to be there yesterday while their less fortunate fellows were sweltering in the sultry, stifling air of the city. Following are the day's records:

First event, five clay-birds—Tinker won first prize, Lewis and Messenger divided second, and Tice won third.

Second event, five clay-birds—Tinker won first prize, Lewis second Tice and Nichols divided third.

Third event, three Paris clay-birds—Tinker won first, Messenger, Eddy and Little divided second, Lewis and Thompson divided third.

Fourth event, five clay-birds—Tinker and Knowles divided first, Lovejoy and Little divided second, Thompson won third and Lewis won fourth.

Fifth event, five clay-birds—Knowles and Thompson divided first, Tinker won second, Nichols third and Messenger fourth.

Sixth event, three Paris balls—Nichols first, Lovejoy and Knowles second, Messenger and Thompson third,

Seventh event, five glass balls—Eddy won first, Nichols second, Little and Lovejoy divided third.

Eighth event, three Paris clay-birds—Thompson won first, Lewis and Tinker divided second, Knowles and Lovejoy divided third.

Ninth event, five clay-birds, five traps.—Tinker won first, Nichols and Lovejoy divided second, Tice, Elwell and Little divided third, Messenger and Eddy divided fourth.

Tenth event, five clay-birds, five traps—Tinker and Howe divided first, Eddy won second, Hilliard and Nichols divided third and Knowles won fourth.

Eleventh event, three Paris glass balls—Tinker and Knowles divided first, Nichols and Little second, Hilliard and Scribner divided third.

Twelfth event, three Paris clay-birds—Nichols first, Messenger and Howe second, Tinker third, Hilliard fourth.

Thirteenth event, five clay-birds—Tinker first, Eddy and Lovejoy second, Nichols third, Howard fourth.

Fourteenth event, five clay-birds—Howe won first, Knowles second, Scribner third,

Fifteenth event, three Paris clay-birds—Nichols first, Howe second, Knowles and Little third.

Sixteenth event, glass balls, miss and out—Nichols and Little divided.

Seventeenth event, three Paris clay-birds—Knowles first, Howe second, Little third.

Eighteenth event, five clay-birds, walk up match—Lovejoy first, Hilliard second, Little third.

Nineteenth event, five clay-birds, walk up match—Little first, Hilliard second, Knowles third.

P. S.—In your issue of the 12th inst, you make us say in our remarks regarding shoot of the 4th inst. that, "with the exception of about half an hour, the entire day was spent eating baked beans," which, while we frankly acknowledge to a free indulgence in that luxury, was a trifle overdrawn, it being our intention to have said that with the exception of about half an hour devoted to the agreeable entertainment of bean eating, the remainder of the day was spent in clay-bird shooting.—F.

PICTON, Ontario, June 19.—A sweepstake match was held by the Picton Gun Club at clay-pigeons to-day, 10 birds each, 16yds. rise, resulting as follows: Soby 7, Jellett 6, Gilbert 6, Reynolds 6, Beaford 6, Gillespie 3, Wright 2, Miller 2. Orchard retired at his second bird. In shooting off the ties for second and third places Bedford and Reynolds divided.

MERIDIAN, Miss., Jan. 19.—The great shooting tournament here of the past three days brought together a large number of the finest shots in the South. The tournament opened on Tuesday; the day was rainy and the matches had to be shot between the showers. There were 45 present.

The first match, 24yds. rise, at 5 live pigeons, resulted as follows: Mobile shooters—W. G. Vass 5, Ladd 5, George 3, Ward 4, Nicholas 1, Drey 1 and Tunstall 4. New Orleans shooters—Cousin 5, Chaudet 4, Mayronne 4, Fuentes 3. Birmingham shooters—F. W. Dunham 2, A. E. Dunham 2. Selma shooters—Ernest Field 3. Asheville, N. C., shooters—Jordan 4. Crawford, Miss., shooters—S. S. Scales 1, Crisler 3, Carr 3. Starkville shooters—W. W. Scales 4. Meridian shooters—Dabney 4, Gallup 1, Cameron 3, Dobsen 3, Stroup 3, Kone 4. Brooksville shooters—N. Scales 3. Macon shooters—Sargent 4, Irion 3. Vass and Cousin divide first money, Tunstall second, Stroup third.

The second match at 10 clay-pigeons, 8yds., rise, 25 entries, except addition of Taylor, of West Point, and Hamilton, of Meridian. Vass won first money, breaking 10; Ladd second, on 9, Cousin, Foot and Chaudet tied for third money.

Chaudet won the third match at 5 live birds, same conditions as the first match. There were 30 entries, about the same as entered in the first match. Tunstall, Vass, Claudet, Jordan, Dabney, W. W. Scales and N. Carr, tied for first money, each killing 5 birds. Chaudet won on the tie shoot. Nine shooters killed 4 birds each, tying for second money, Richard and Ward led the score in the shoot off and divided the money, and Cameron and Stroup divided third money.

OLD SQUIRE JACKSON got his gun ready, took his target, bullets, powder, etc., and walked five miles to a shooting match, and then discovered that he had left his gun at home.—KANSAS FARMER.

WEBSTER, Mass., June 19.—A challenge from the club at Southbridge has been accepted by the Webster Rod and Gun Club, and it will take place at Southbridge July 4. The Webster Club are contesting among themselves for a gold badge. It is to be the property of the man that has the largest score at the end of the season. The first contest was yesterday, the largest score out of a possible 20 was 13, that of Eugene Smith.

Yachting.

FIXTURES.

Secretaries of yacht clubs will please send early notice of pro posed matches and meetings.

June 26.—Salem Bay Y. C., First Championship Match.
June 27.—Eastern Y. C., Annual Matches.
June 28.—Boston Y. C., Ladies' Day.
June 30.—Manhattan Y. C., Annual Cruise.
June 30.—Quincy Y. C., Second Match.
July 4.—Larchmont Y. C., Annual Open Matches.
July 4, 5, 6.—Quaker City Y. C., Corinthian Cruise.
July 4.—Hull Y. C., Review and Annual Cruise, five days.
July 4.—Boston, open matches, City Point.
July 9.—Beverly Y. C., Marblehead, First Championship.
July 12.—Boston Y. C., Second Club Match.
July 12.—Hull Y. C., First Club Match.
July 19.—Hull Y. C., Ladies' Day.
July 24.—Eastern Y. C., Annual Cruise.
July 26.—Beverly Y. C., Nahant, Second Championship Match.
July 30.—Quincy Y. C., Third Match.
Aug. 2.—Hull Y. C., First Championship.
Aug. 4.—Quaker City Y. C., Review and Harbor Cruise.
Aug. 9.—Boston Y. C., Annual Matches.
Aug. 11–25.—Quaker City Y. C., Annual Cruise in Chesapeake and Delaware Bays.
Aug. 16.—Salem Bay Y. C., Open Matches.
Aug. 16.—Hull Y. C., Open Matches.
Aug. 23.—Boston Y. C., Third Club Match.
Aug. 23.—Beverly Y. C., Open Match.
Aug. 26.—Beverly Y. C., Special, Marblehead.
Aug. 28.—Quincy Y. C., Fourth Match.
Aug. 30.—Hull Y. C., Second Championship Match.
Sept. 3.—Hull Y. C., Third Championship Match.
Sept. 4.—Salem Bay Y. C., Second Championship Match.
Sept. 6.—Beverly Y. C., Marblehead, Special Match.
Sept. 11.—Quincy Y. C., Last Race.
Sept. 11.—Brenton's Reef Challenge Cup.
Sept. 13.—Boston Y. C., Ladies' Day.
Sept. 13.—Boston Y. C., Fall Matches.
Sept. 14.—Quaker City Y. C., Review and Cup Race.
Sept. 28.—Quaker City Y. C., Review and Harbor Cruise.
Oct. 5.—Quaker City Y. C., Closing Review and Cruise.

NEW JERSEY Y. C.

THE New Jersey Y. C., although their fleet numbers only small boats, have taken a stand on the questions of shifting ballast and limited crews that puts them in the rank of yachtsmen and Corinthians, and the club offers greater inducements to the lovers of small yachts than any similar organization about New York. While their boats are still, of necessity, of the small type of centerboard craft used here so long, they are so rigged and fitted as to be easily handled by a small crew, and safe in case of a capsize, and should the club continue in its present course, we may hope to see some day a numerous fleet of safe and wholesome boats under its flag.

Their 19th annual matches took place on the river and bay on Thursday, June 19, the course being for Classes A and B, from a line off the club house, Hoboken, down past Robbins Reef buoy, and around Buoy 13 on the West Bank and home, finishing off the Communipaw coal dock. Jersey City, the smaller class only going around Robbins Reef buoy, while Class C rounded Fort Lafayette. The boats starting, all of which were sailed by their owners, were:

CLASS B—OPEN SLOOPS.

Name.	Owner.	Ft.	In.
Charm	E. W. Ketcham	28	06
Meteor	A. Jeanneret	28	04½
Eagle Wing	J. & C. Burlton	27	10½
Lily R	Theo. H. Rogers	27	05
Dare Devil	W. H. Dilworth	27	04

CLASS C—OPEN SLOOPS.

Lottie M	W. C. Morris	25	05
Rambler	J. H. Thorn	25	00½
Corinne	Louis Kayser	23	01½
Sophia Emma	Charles E. Korff	21	09
Coquette	Lucien Aices	21	04

CLASS D—OPEN SLOOPS.

Katie	Frederick Baar	20	10½
Senator	John Von Drathen	20	00
Skip	W. Ortriel	18	06
Fanny	William Turner	18	00
Kitty S	H. S. Stilling	17	10

The propeller John Lenox having on board the judges, Messrs. T. P. Rogers, T. Bretts and Geo. E. Garland, besides members and guests, was ready at the line by 10:30 A. M., there being then but little wind, with a warm, clear day.

The first whistle sounded at 10:55 and the second at 11 A. M. The ebb tide drifted the boats down on the line in a most laughable fashion, some going over crabways, others stern first, none with enough wind to give steerage way, and most of them using sweeps above the line. Katie was over first at 11:01, Senator, Eagle Wing, Lottie M. following.

They went down under the Jersey shore in a long line, booms to port or starboard, what wind there was being north. Lily R. leading the way. As she passed the coal docks she caught a new breeze from the south, and stood down and across on port tack, each boat as it reached the same point catching the breeze and following her until all were strung in line across the river, beating down.

At noon the Bay above the Narrows was hidden by a thick smoke or haze, in which the yachts were shrouded, but it soon cleared away, leaving it hotter than before. Lily R. was still leading in the beat down. The times at Robbin's Reef were:

Lily R	12 25 40	Skip	12 39 40
Dare Devil	12 30 13	Fanny	12 41 21
Meteor	12 30 40	Lottie M	12 41 42
Rambler	12 30 42	Corinne	12 45 16
Sophia Emma	12 32 43	Coquette	12 46 31
Charm	12 32 45	Kitty S	12 47 41
Senator	12 37 36		

Dare Devil, Meteor and Rambler rounded together and were soon after the Lily, all on starboard tack, soon working short tacks down the middle in a fresh breeze. At the forts it fell calm and continued so for some time. Lily R. went off into Gravesend Bay, and after a time found a breeze there that brought her up well ahead to Buoy 13 at 2:32:25. Dare Devil also followed the same course, though well astern.

Now came the most exciting part of the race, as Meteor came down

from Dix Island on the starboard tack, while Dare Devil came out of the bay on port, the former having the best of it, and turning at 2:54:00.

In Class C, Senator was first around Fort Lafayette, Fanny second, Kate third. Senator's luck forsook her when she gybed off the Reef buoy, as she capsized, but no harm was done.

The wind was light from south, and all hurried home with jibs boomed out, but Lily was still far ahead, crossing the line off the Communipaw coal dock at 3:47:25.

CLASS B—OPEN SLOOPS.

Name.	Start.	Finish.	Elapsed.	Corrected.
Charm	11 01 25	4 21 29	5 17 04	5 17 04
Meteor	11 07 35	4 18 09	5 05 34	5 05 19
Eagle Wing	11 03 35	Not timed.		
Lily R.	11 09 05	3 47 25	4 38 20	4 36 10
Dare Devil	11 08 54	4 12 07	5 03 13	5 00 53

CLASS C—OPEN SLOOPS.

Lottie M.	11 03 35	Not timed.		
Rambler	11 05 55	4 26 10	5 20 15	5 19 30
Corinne	11 08 06	Turned back in Narrows.		
Sophia Emma	11 08 43	4 28 18	5 19 35	5 12 15
Coquette	11 08 54	Did not go the course.		

CLASS D—OPEN SLOOPS.

Katie	11 02 00	4 03 31	5 01 31	5 01 31
Senator	11 02 10	Capsized off Robbins Reef.		
Skip	11 02 30	4 01 41	4 59 11	4 54 26
Fanny	11 07 17	3 47 46	4 40 29	4 34 44
Kitty S.	11 06 12	4 07 28	5 01 16	4 55 11

In the evening the club gave a supper to their friends.

NEW YACHTS ABROAD.

THE English yacht fleet has been increased by the addition of three new vessels in the larger classes, besides a number of smaller ones, the largest of the three being Irex, lately described in our columns. She is 83ft. on loadline, 15.1ft. beam, 14ft. draft, keel 7½ tons, composite build, steel frames and wooden skin, and was built for Mr. John Jameson by Fay, of Southampton.

The next in size is Genesta, 81ft. on loadline, 14.6ft. beam, 11.75ft. depth of hold, 13ft. draft, with 60 tons on keel and but 4 tons inside; racing tonnage, 80 tons. Her owner is Sir Richard Sutton, and she was built by Messrs. Henderson, at Partick-on-the Clyde. In her first race, New Thames Y. C., May 31, she won by three minutes even time from Vanduara, the latter also allowing her time. Erycina and Marjorie also being in. On the following Monday she gained but third place, Tara and Marjorie being ahead of her, but on the next day, in the Channel match, she won easily from Marjorie and Erycina, Vanduara losing her bowsprit. On the 4th, in the Royal Thames matches, she was beaten by Marjorie, which performance was repeated on the next day in the New Thames match, Marjorie being again ahead and Genesta second, Vanduara, Erycina and Miranda also being in. In the Nore to Dover match, June 7, Genesta won again, with Lorna second, Marjorie third and Vanduara, Tara, Erycina and Miranda also in. On June 9, at Dover, Royal Cinque Ports Y. C., she was beaten by Lorna, an 85-ton yawl, and met the same fate again on the following day.

The last and smallest of the trio is Marguerite, a 60-tonner, 74ft. loadline, 13.5ft. beam, 12.5ft. draft, keel 51 tons, lead inside 6 tons. She is composite build, steel frames, pitch pine bottom plank, teak topsides.

THE RACE AROUND LONG ISLAND.

LIKE the preceding races, that of last week around Long Island has done little to settle the questions in dispute, the wind being so variable, and flukes so numerous that the result is of little value.

The victory remains with the sloops, and, of the schooners, with the Grayling, but the most that their advocates can claim is that under their most favorable conditions, light winds and perfectly still water, the pick of our light weather fleet have beaten the deeper boats less than three hours in a race of 240 miles. Grayling defeats the deep Fortuna by 2h. 57m., while Fortuna in turn leads Montauk 22m., and with the sloops, Fanny beats Ileen by 2h. 37m., Gracie beats her by 2h. 4m., while Hildegarde has but 21m. lead of her; and in the second class, Vixen beats Oriva by 1h. 2m.

After leaving the Bay, as told in FOREST AND STREAM last week, the fleet stood on with spinnakers to starboard before the wind, the order at 7 P. M. was, Fanny, Hildegarde, Ileen, Fortuna, Grayling, Gracie, Athlon, Montauk, Oriva, Vixen, Ruth, Wenonah, Estelle, Fleetwing. Light winds were found with occasional calms all Monday night, Fire Island being passed at 10 P. M., and Shinnecock shortly after 3 A. M., the wind being mostly from the west and north. At daybreak the order of the leaders was Montauk, Fortuna, Fanny, Grayling.

At 5 A. M. a calm ensued, the three leaders drifting close together, but a breeze from the north started them off again, Montauk ahead, and at 7 A. M. Montauk Light was sighted. Here a long calm ensued and it seemed as though the point would never be rounded, but at 9:30 A. M. Montauk passed it. Fanny being second and Fortuna third.

All through the morning there was a succession of light winds and calms, provoking the yachtsmen and shifting the positions of the boats from time to time. At noon Fanny started through Plum Gut, passing out at 2 P. M. with Fortuna half an hour behind, while Montauk, having taken the Race, was becalmed there. Calms ensued for several hours, but at 4 P. M. a breeze from the southwest started the fleet again, gaining strength as the afternoon advanced, until kites came in, and there seemed some prospect of a sail at the end of the race. At 6 P. M. the order was Fanny, Fortuna, Grayling, Hildegarde, Athlon, Vixen, Montauk.

Off Port Jefferson at 9 P. M. the wind died down, and a little later all was calm again, continuing so all night, the yachts merely drifting. At daybreak the fleet was well scattered, Grayling being ahead and Ileen up in second place. The morning was unpleasant in every way, an ebb tide carrying the boats back, no wind and a thick haze covering the entire Sound, but in the forenoon a light southwest wind woke all up again, Fanny leading. For the rest of the way the wind was light, but it brought Fanny up to the line at 11:44:08, with Grayling close astern of her. Half an hour elapsed before Gracie came in to claim third place, then a couple of hours more before Hildegarde, Vixen and Ileen made their appearance, Ruth carried away her jibboom off Montauk and put into New Bedford, being unable to continue. The times of the competing yachts were as follows:

SCHOONERS.

	Start.	Finish.	Elapsed.
2. Grayling	4 06 58	11 44 44	43 37 46
8. Fortuna	4 06 58	2 40 53	46 33 55
9. Montauk	4 06 58	3 02 40	46 55 52
11. Estelle	4 06 58	3 52 40	47 45 42
13. Fleetwing	4 06 58	Not timed.	
— Ruth	4 06 58	Disabled.	

FIRST CLASS SLOOPS.

1. Fanny	4 06 58	11 44 08	43 37 10
3. Gracie	4 06 58	12 17 45	44 10 47
4. Hildegarde	4 06 58	2 00 57	45 53 59
6. Ileen	4 06 58	2 21 23	46 14 25
12. Wenonah	4 06 58	4 03 00	47 56 02

SECOND CLASS SLOOPS.

5. Vixen	4 06 58	2 11 57	46 04 59
7. Athlon	4 06 58	2 35 25	46 28 27
10. Oriva	4 06 58	3 13 30	47 06 32

At the finishing line, between Execution and Sands Point, was a tug that had been there since the preceding day, on which were Com. Monroe and Messrs. Stewart, Brown, Jenkins and Adams, of the Larchmont Y. C., who had offered to time the finish. After their arrival the yachts anchored in Larchmont Harbor, their crews being entertained by the Larchmont Y. C.

NEW HAVEN Y. C. ANNUAL MATCHES.

THE yachtsmen of New Haven have been busier this spring than ever before, preparing for the third annual matches, which were sailed on June 24 on the Sound. Their fleet numbers 33 yachts, steamers, sloops and cats, there being three of the former: Sophia, 125ft., C. H. Osgood owner; Venture, 100ft., J. J. Phelps, and Beatrice, C. R. Palmer. The second division of the fleet, sloop yachts, is divided into four classes, B, C, D and E, according to length over all, Class B being 45ft. and over; Class C, 35 to 45ft.; Class D, 25 to 35ft.; and Class E, 15 to 25ft. The time allowance is based, however, on waterline plus one-third overhang.

The wind through the entire day was very light. The steamer John H. Starin accompanied the yachts over the course, carrying the members and their friends, while Mr. R. B. Rathbone's steam yacht Pastime carried the judges. At 11:12 A. M. all were ready, and a gun was fired from the Pastime as a signal for classes E, sloops of 15 to 25ft., and G, catboats of 15 to 25ft., the Wild Bird being the first over the line and Trio second, no boats starting in Class G. At 11:18 Class D was started with Acme, Ceres, Defiance, Lorelei, Louise, Endeavor, Vixen and Stranger in the above order; then followed Starlight, Flora, Happy Thought, Rajah, Viking, Wayward, Marguerite, Rival, Wild Duck of Class C, with Wild Pigeon and Viola, Class B behind them.

All went over on starboard tack, and most of them held on for some time, the wind, however nearly dying out. Stranger took the lead after a time, with Ceres next, then Louise, and at the turning mark, Charles Island Buoy, she had a good lead, luffing around it in fine style, and running up balloon jibtopsail.

Ceres was next around, then Vixen, Flora, Louise, Rival, Wild Duck, Viking, Wild Pigeon, no others being timed, as the steamers ran on to overtake the leaders, now well ahead. Stranger still led on the run home, and was first in of all the fleet, followed closely by Flora and Ceres, who had stuck to her all the way home. In Class E, Trio came in just 5m. before the Stranger's arrival.

The times were as follows:

CLASS B.

Yacht.	Owner.	Actual.	Corrected.
Viola	C. N. Wayland	5 08 00	5 16 00
Wild Pigeon	Vice C. Wheeler	5 10 43	5 06 43

CLASS C.

Wild Duck	Fleet Capt. Lutz	5 02 58	
Wayward	C. B. Warner	5 18 38	5 17 23
Rival	W. W. Converse	5 00 56	4 58 58
Starlight	M. White	5 23 35	5 20 45
Mascott	Weld & Jacobs	5 16 14	5 15 10
Happy Thought	Geo. M. Graves	5 26 21	5 20 10
Flora	A. C. Perkins	5 05 04	4 54 11
Marguerite	Charles M. Peck	5 17 43	5 11 42
Viking	F. C. Swan	5 13 48	5 05 28

CLASS D.

Endeavor	H. D. Billard	5 20 31	
Ceres	Parish & Rawson	5 08 38	5 07 29
Louise	Thomas H. Hall	5 33 08	5 30 35
Vixen	Allen Seaman	5 09 53	5 03 49
Stranger	J. N. Macauley	5 03 31	4 58 13

CLASS E.

Trio	W. L. Cheney	5 04 30	

HULL Y. C. PENNANT MATCH.

THE first pennant match of the Hull Y. C. was sailed on Saturday, June 21. Six classes entered, but only four started, as the wind was light throughout. The courses were as follows:

Second Class—From judges' line to black brush buoy No. 1, half a mile south, leaving it on the starboard, to yellow barrel marked H. Y. C., off Pettick's Island, leaving it on starboard; through Hull Gut to buoy on Wilson's Rock, off Rainsford Island, leaving it on starboard; thence, leaving Hunt's ledge and Point Allerton buoys on starboard, to bell boat on Harding ledge, leaving same on port. Returning, leaving Point Allerton and Hunt's ledge buoys on port, to judges' boat, passing between it and flag boat—a distance of eleven nautical miles.

Third Class—From judges' line to West Gut, leaving Pettick's Island on starboard; thence, northeast by north three-quarters of a mile to black buoy on Wilson's Rock, leaving it on the starboard; thence to striped buoy on Hunt's ledge, leaving it on starboard; through Hull Gut to the judges' boat, passing between it and a red flag—a distance of seven nautical miles.

Fourth and fifth classes—From judges' line to steamboat barrel off Seal Rocks, leaving it on starboard, to buoy off Prince's Head, leaving it on port, to No. 1 brush buoy (one mile south of starting point), leaving it on starboard, to yellow barrel buoy marked H. Y. C., off Strawberry Hill, leaving it on port, to steamboat barrel off Seal Rock, leaving it on starboard, to barrel buoy off Pettick's (Cleverley's), leaving it on starboard, to judges' line—a distance of seven miles.

The race was started at 3 P. M., at high water, with the following boats:

Second class, sloops, 25ft. and under 30—Transit, E. H. Ingalls; Banneret, J. F. Brown.

Third class, sloops, 21ft. and under 25—Seabird, Geo. S. Forbush; Kitty, E. H. Tarbel.

Fourth class, cats, 20ft. and under 25—Joker, Geo. Coffin; Niobe, F. L. Dunn.

Fifth class, cats 18ft. and under 20—Imogene, B. T. Wendell; Myrtle, C. H. & R. C. Poor; Spray, H. M. Faxon; Mirage, L. M. Clark; Wildfire, H. M. Keith; Kismutch, H. H. Curtis; Samaria, L. G. King. The prizes in each class were champion pennants, to be retained by the winners.

Transit was away, ahead of Banneret, who was in trouble with her jib, but righting matters, started in chase, making a good race but in second at the line.

Seabird and Joker came in first in their respective classes, and Imogene in the fifth class, with Spray second. The times were:

SECOND CLASS.

	Length.	Actual.	Corrected.
Transit, c. b., F. H. Ingalls	27.01	2 25 36	1 52 41½
Banneret, c. b., J. F. Brown	25.01	2 30 15	1 55 05

THIRD CLASS.

Seabird, c. b., George S. Forbush	23 01	1 23 18	0 59 18
Kitty, k., E. H. Tarbel	23.09	1 27 00	1 03 33

FOURTH CLASS.

Joker, c. b., George Coffin	20.08	1 49 50	1 23 44
Niobe, c. b., F. L. Dunn	20.06	1 57 15	1 30 52

FIFTH CLASS.

Imogene, c. b., B. T. Wendell	18.10	2 00 08	1 31 59
Myrtle, c. b., C. H. & R. C. Poor	19.06	2 01 43	1 34 18
Spray, c. b., H. M. Faxon	18.10	2 06 28	1 38 19
Mirage, c. b., L. M. Clark	18.10	2 15 38	1 46 20
Wildfire, c. b., H. M. Keith	18.01	Not taken.	
Kismutch, c. b., H. H. Curtis	18 11	Not taken.	
Samaria, c. b., S. G. King	19.01	Not taken.	

In the evening Vice-Commodore Crane presented to the club a full-rigged model of an English cutter yacht. The following races have been arranged for the balance of the season: July 5, club cruise, general orders yet to be announced; July 12, forty-second regatta, beginning at 3 P. M.; July 19, ladies' day, particulars to be announced; Aug. 2, first championship regatta, 3 P. M.; Aug. 16, open matches, particulars to be announced; Aug. 30, second championship regatta; Sept. 6, third championship race. In all the above regattas cash prizes are to be awarded, as follows:

First class sloops—First prize, $25; second prize, $15. Special class schooners—First prize, $15; second prize, $10. Second class keels—First prize, $20; second prize, $15. Second class centerboards—First prize, $20; second prize, $15. Third class keels. Regular—First prize, $15; second prize, $10. Corinthian—First prize, $2; second prize, $1. Third class centerboards. Regular—First prize, $15; second prize, $10. Corinthian—First prize, $2; second prize, $1. Fourth class catrigs. Regular—First prize, $15; second prize, $10; third prize, $5. Corinthian—First prize, $2; second prize, $1. Fifth class catrigs. Regular—First prize, $15; second prize, $10; third prize, $5. Corinthian—First prize, $2; second prize, $1. Sixth class catrigs. Regular—First prize, $10; second prize, $5. Corinthian—First prize, $2; second prize, $1.

At least two yachts must sail in a class to insure one prize being given, three to insure two prizes, and four yachts to insure three prizes.

The regatta committee of the club are: M. J. Kiley, chairman, J. A. Osgood, W. K. Miller, H. N. Curtis, F. M. Griffin, E. A. Dow, P. M. Bond.

DORCHESTER Y. C.—80th MATCH.

THE 80th match of the Dorchester Y. C., open, in the first class, to yachts of any club, and all other classes to yachts of clubs enrolled in the New England Y. R. A., was sailed off Nahant yesterday, and was in every respect a complete success. Up to the time of closing the entries for the race about 50 boats had been enrolled, and of these more than 40 put in an appearance and crossed the line in their various classes. The first and second classes started in good order at 12:30, followed 10 minutes later by the third class, all the boats making good time in crossing the line. The course for the first and second classes was No. 3 from starting line, leaving Graves whistling buoy on starboard, Davis' ledge buoy on the port, Graves whistling buoy on port, to starting line, 22 miles; limit of time six hours. The course for the third class was No. 6, from starting line, leaving Graves whistling buoy on starboard, Winthrop bar buoy on starboard, to starting line, 10 miles; limit of time 3½ hours.

The wind, which early in the day had been light from the southwest, shifted at about noon to the eastward and blew an excellent breeze, which continued throughout the day, giving the yachtsmen a rare opportunity to show their crafts to the best advantage. The prizes awarded were as follows: First class—First prize, $60. Second class—First prize, $30; second, $20; third, $15; fourth, $10. Third class—First prize, $20; second, $15; third, 10; fourth, $5. In the second and third classes, the prizes were awarded to the first two keel and first two centerboard yachts of each class. The captain of the Una entered a protest against the David Crockett for shifting ballast, and, although this does not affect her as regards yesterday's race, as she was among the last boats to come in, it will, if proved against her, debar her from racing in any regatta of any club belonging to the New England Yacht Racing Association, under whose rules the regatta was being sailed. The Echo carried away her topsail, and thus greatly impeded her progress, and perhaps lost her a prize, as she was well to the lead of many of the boats at the time of the accident; and the Bannerett disabled her topmast early in the race. The new steam tug, Wesley A. Gove, Capt. W. H. Jenkins, was used as a judge's boat, and every courtesy was extended the members of the press to witness the regatta, Capt. Jenkins ordered the boat run over the course while dinner was being served. Capt. C. H. Whiting of the Dorchester Y. C. piloted the craft throughout the day. The judges were C. H. Whiting, chairman; L. M. Clark, Erastus Willard, S. G. King, H. B. Callender.

The prize winners were as follows: In the first class the Huron, in the second class the Shadow, Nimbus, Lapwing and Percey H., in the order named, and in the third class the Kitty, Transit, Niobe and Black Cloud, respectively. Below is the summary:

FIRST CLASS.

	Length.	Actual.	Corrected.
Huron, William Gray, Jr	53.03	4 05 48	3 38 26
Maggie, G. H. Warren	46.01	4 21 01	3 43 46
Adrienne, Jacob Pfaff	55 00	4 13 58	3 46 58
Hesper, W. H. Forbes	47.06	4 24 25	3 48 38
Nirvana, S. P. Freeman	42.09	4 30 39	3 49 42

SECOND CLASS.

Shadow, Dr. John Bryant	34.06	4 30 28	3 38 18
Nimbus, B. Jenney, Jr.	33.11	4 35 42	3 43 37
Lapwing, J. Malcom Forbes	37.02	4 35 34	3 47 24
Magic, E. C. Neal	31.02	4 45 27	3 47 42
Percy H., H. Hall	33.00	4 59 40	4 02 18
Lillie, J. P. Gale	36.08	4 54 57	4 06 05
Ægir, N. McCormick	35.02	4 59 40	4 08 34

THIRD CLASS.

Kitty, Tarbell & Adams	23.04	2 09 50	2 03 05
Transit, E. H. Ingalls	26.08	2 08 40	2 05 34
Niobe, F. L. Dunn	21.00	2 25 38	2 15 53
Black Cloud, E. C. Cunningham	22.11	2 26 29	2 17 58
Greta, J. W. & W. S. Hill	23.01	2 29 40	2 22 37
Saracen, W. F. & J. R. Fowle	23.00	2 30 38	2 23 29
Lizzie Warner, E. Lutted	25.01	2 28 30	2 23 46
Una, John Marno	30.01	3 34 06	2 24 21
Banneret, J. F. Brown	24 07	2 29 45	2 24 27
Gem, W. H. Hammond and others	26.01	2 27 22	2 24 41
David Crockett, H. Putnam	21.04	2 34 04	2 24 46
Pet, J. McFarlane	21.00	2 37 46	2 26 01
Echo, Putnam & Hudson	25.04	2 30 36	2 26 08

Boston Herald, June 18.

"THE AMERICAN YACHT LIST."

THE growth of yachting in America is well shown by the increased size of its index, Olsen's American Yacht List, a copy of which for 1884 has just come to us. The book is now an established institution among yachtsmen, and has a place in every club room and cabin in the country. The main portion of the book, the list of yachts, is larger and more complete than ever before, although some errors are still present, due to the carelessness of yachtsmen who neglect to send corrections and notices of alterations in their craft.

The labor of compiling a correct list is immense, and accuracy can only be obtained by the co-operation of yachtsmen. A printed blank is inserted in each copy, and if every yachtsman who finds an error in the dimensions of his boat will only fill out the blank and mail it, such errors will soon disappear. Besides the tables of signals and list of yachts there are many useful details—calendars, tide tables, code list of the U. S. Navy, lists of coast survey, lighthouse and revenue vessels, the old and new deeds of gift of the America Cup, the International Code, day and night signals, lists of secretaries, times of meetings, dues, etc., of the various clubs, a list of owners, and a list of American yacht clubs, with the fixtures for the year. The list of yachts contains nearly 1,600 names, while sixty clubs are given Copies of the book can be had of FOREST AND STREAM, the price being $3.

SIGNALS OF RACING YACHTS.—*Editor Forest and Stream:* I have witnessed the New York Y. C. regatta for several years, and find strangers unable to make out the different yachts by their flags at the peak. They are not large enough, and when the wind is light hang lazily down the leach, the most powerful glasses failing to make them out. As many members of yacht clubs in different parts of the country annually come to witness these races, would it not be well to introduce a more distinct mark either of number or flag? The races of last week in New York have demonstrated that the American type of boat revolutionized, is the boat for our waters, and while we acknowledge the splendid sailing of the cutter Ileen in a "nose ender" covering less than one-fifth of the course, yet it will not do as a favorable result of the five-fifths. Still, the agitation of the subject in FOREST AND STREAM has had a good effect. Our sloops have been improved in rig and ballast, and builders taking the hint have curtailed in width and have gone deeper. The medium boat will be the boat for all-around sailing and for our waters. FOREST AND STREAM can take the credit for all this; we preach up extremes, and feel satisfied to have the "lay backs" come half way. Even "Delaware River Cninamen" have learned the value of the instructions laid down in your paper, and next year a class of honest seaworthy boats will make their appearance on our waters. "Planks on edge" and "dish" boats will gradually disappear; they will have to make room for the coming boat.—R. G. W. [Our correspondent is right in regard to the signals usually displayed, as they are practically useless. The yachts of the Atlantic Y. C. this season in their races carried numbers in the throat of their mainsails of such a size as to be visible at a long distance, enabling the spectators to distinguish the yachts throughout the race. We noticed in the New Jersey Y. C. races that some of the boats displayed their numbers, which were too small in any case to be of use, under their flags at the peak, where they could not be read even when near by. We do not agree with our correspondent in his conclusions from the late races, and while we are with him in the fight for honest boats, we see no reason yet to believe that the mean has been found in the late compromise type.]

AFTER THE CUTTER MADGE.—There is a growing impression that if the English built cutters which have been thought to be invincible can be beaten by American bottoms, the craft to beat her must be sent to New York from Boston, and appearances indicate that an effort in that direction will be made this season. Dr. John Bryant's Shadow, and Mr. Charles G. Weld's sloop Hera, and American cutter King Philip will probably be the vessels from which a choice will be made. Orders have already been given to put the Hera in perfect racing trim, and no expense will be spared to make her as fast as possible. Arthur Dean, one of the best sailing masters of pleasure craft in Eastern waters, is to command the Hera, which will have a picked crew. The King Philip will be in readiness for racing very shortly. She will be sailed by Capt. Rickerson, another good skipper, and will also have a picked crew of eight men. It is not improbable that the King Philip, Shadow and Hera will be prepared for a friendly trial, and will sail a series of races in order that their relative qualities may be properly tested. The winner in the races will be the chosen boat to sail against the Madge. The three pleasure and racing ships will start in the Eastern Yacht Club regatta next Friday.—*Boston Herald.*

YACHT RACING IN FRANCE.—A series of matches, open to yachts of all nations, will be sailed off Havre on July 12, under the auspices of the Société des Regates du Havre. The first match will be started at 10 A. M., over a course of 30 miles, and will be open to three classes, the first, 70 tons and over, Havre measurement. First prize, 1,500 francs and a telescope offered by the Admiralty; second prize, 500 francs and a binocular, also offered by the Admiralty. Class 2, for yachts of 40 to 70 tons. Prizes: 1,200 francs and medal, 400 francs and medal. Class 3, for yachts of 15 to 40 tons, 1,000 francs and a medal, 300 francs and a medal. The "prize of honor," a work of art, presented by the Yacht Club of France, will be competed for by the three winning yachts, while a special prize, also a work of art, is offered by the President of the Republic for French yachts. After the above, a race for French pilot boats will be started, and at 10:30 the small-decked and open yachts from 5 to 15 tons, will start over a 20 mile course for three prizes of 500, 200 and 100 francs. The entrance fees are 50 francs for yachts not belonging to the society, and 25 francs for members' yachts. Sailing and rowing races will also take place on the 11th, 12th and 13th, and the Regatta Ball will be held on the 12th.

GREENWICH HARBOR.—We have received from Mr. H. F. Winslow a chart and sailing directions for entering this harbor. The following marks and lights are now in position and will remain until Sept. 15: A spindle on Old Ledge Rock, with a red light at night. A spindle on Jones's Stones, on the west side of the channel and N.W. of Great Captain's Island, with red light at night. A green light on S.W. corner of Indiad Harbor Hotel. Entering the harbor from the east when the spindle on Old Ledge bears W. by N. run for it until Great Captain's Island Lighthouse bears W.S.W., then sheer N.W., and when the green light on the hotel bears N.E. ¾ N., anchor. Entering the harbor from the west, leave the light on Jones's Stones close on the port hand and steer N.E. ¾ N. until within ¼ mile of the green light on the hotel, and then anchor. The anchorage is good in any part of the harbor, the bottom being sticky and the holding-ground good. There is a small ledge with 4ft. of water on it, bearing about W. ⅜ S., ⅝ of a mile from the west end of Great Captain's Island, on the port hand in entering. Yachts can obtain water and provisions at the hotel.

YACHTING IN SAN FRANCISCO.—Eight yachts started for a cruise to Antioch on Decoration Day, six of them reaching there in the afternoon, beating down on Saturday, Whitewing being first with Eva, Emerald, Frolic, and Ripple following, Fleur de Lis being hung up on a sandbank for some time. On the following day all started at 9:35 A. M. for a race home, Aggie coming in first at 1:28, Chispa second, 1:36 and Fleur de Lis at 1:41. On June 7 a reception was given by the San Francisco Y. C. at their club house. The Aggie, Annie, Nellie, Frolic, Lurline, Emerald, Rambler, Lolita, Dawn, Chispa were at anchor at Saucelito, all decked with flags. The afternoon was spent by the yachtsmen in visiting among the yachts, a lunch under an awning by the club house forming part of the programme. Arrangements are on foot for a regatta on July 4.

ROYAL CANADIAN Y. C.—The annual meeting of this club was held on June 7, at their club house, Toronto. Reports of the financial condition of the club, showing its prosperous condition, were read. It was recommended that a series of yacht maneuvers be arranged for each Friday during the season, and also that a junior membership be established, to include members between eighteen and twenty-five years old, at an annual fee of $5. It was also recommended that the club join the Lake Yacht Racing Association. The proposal for a junior membership was so amended as to take in young men from eighteen to twenty-one, at a fee of $10 per year, admitting them to full membership when twenty-one years old without an entrance fee. It was also moved and carried that the club should join the Lake Ontario Yacht Association, and that it should send delegates, and also a motion was passed changing the number of the sailing committee from five to seven. The following officers were elected: Commodore, John Leys; Vice-Commodore, G. Gooderham; Rear-Commodore, J. Wier Anderson; Committee—W. G. Cassels, R. Cochran, E. H. Duggan, C. L. Ferguson, Bruce Hannan, Beverley Jones, A. B. Lee, H. Pellatt, C. E. Ryerson.

"AHOI!"—We have receive d from the publishers a copy of a new magazine with the above title, devoted to the interests of German water sports of all kinds The prospectus sets forth that *Ahoi* intends to further the interests of the German yachtsman, whether they hoist up the sails on a 100-tonner or on a modest open 20ft. boat, and we wish them success in their endeavor. The following extract from "the programme of the expedition of the *Ahoi*" is worth putting on record: "The *Ahoi* upper ten edition. For princes and other persons of high rank, wealthy people, amateurs, two rare editions, A. O. S. Only about thirty copies of every number of this monthly are printed on the best writing paper and elegantly furnished." This would not do in America.

RACING YACHTS' TONNAGE.—A good racing tonnage rule is certainly a desideratum, and we should think the yachting community will not much longer be without one. No rule can, we think, permanently place comfortable pleasure craft on an equality with racers, but it would be easy to reduce the present wide disparity, and afford room for the development of other and more desirable things than heavy lead keels. There is the further objection to racing yachts of the present type, that the lead keels and its connections necessary, make the vessel very costly, while as things have gone of late years she is only successful till a designer produces a vessel with still more lead, and then the ex-racer is next to useless.—*Nautical Magazine.*

KNICKERBOCKER Y. C.—Yachts intending to start on the summer cruise will rendezvous at Echo Bay, New Rochelle Harbor, on July 3. The flagship, Lara, Commodore Hobby, will leave Port Morris at 4 P. M. on Thursday, and the other yachts are requested to start in company with her. A meeting will be held at 8 P. M. on Thursday, on board the Sara to determine the direction of the cruise. All will return on July 6.

YACHTING ON THE DELAWARE.—Commodore John Hanigan, 1412 Belgrade street, Philadelphia, will match the yacht Richmond, 24 feet long, against any boat of her length in the State (the Pauline excepted) for $200 or $500. Apply to the Commodore or to R. G. Wilkins, Cooper's Point, Camden, N. J.

MEETINGS.—New York Y. C., fourth general meeting, Thursday evening, July 17, 67 Madison avenue; Knickerbocker Y. C., Tuesday evening, July 1, at club house; Atlantic Y. C., Monday evening, July 14, at club house.

EASTERN Y. C.—The matches of this club will be sailed off Marblehead on Friday, June 27. The course and other details were given in FOREST AND STREAM of June 12. Bedouin, Ileen and Wenonah are all entered.

MADGE.—This cutter was hauled up last week in Jersey City for repairs to her copper. Her owner will not race her this season, but will use her for cruising only. She is in charge of one of her old crew.

ROWBOAT WANTED.—We would call attention to an advertisement for a light rowboat in another column. Any one having such a boat to sell may find a purchaser by writing to the address given.

CAPE MAY RACE.—The only entries for this race were Montauk and Ruth, and the latter being still at New Bedford, the race has been dropped for the present.

MAMIE H.—This yacht which was sunk by the catboat Stewart, during the races of the K. Y. C., on May 30, has been raised and is all right again.

TORONTO C. C.—This club will open the season with a series of races for five-tonners, three prizes and a champion flag being offered.

NUBIENNE.—This steam yacht has arrived at Quebec from Havre, and will shortly visit Newport and New York.

Canoeing.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

July 4, 5, 6.—Rondout C. C., Camp at Esopus Island.
July 9 to 15.—Chicago C. C., Annual Cruise.
July 14.—Allegheny C. C., Cruise at Conneaut Lake.
July 19.—Chicago C. C., First Annual Regatta.
July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 15.—A. C. A. Meet, Grindstone Island.

MERRIMACK RIVER MEET.

THIS, the first general gathering of Eastern canoeists, duly came off as arranged by the two Lowell members of the A. C. A., and was undeniably a success, notwithstanding the fact that fully ten outside canoeists who had promised to come failed to show up at the time agreed upon; but the canoeing members of the Vesper Boat Club turned out in force, and with others from Lowell, Lawrence, Haverhill, Salem and Boston made up a party which numbered about fifty, with something more than half as many canoes.

Most of the latter were of the open variety commonly used on the river, carrying two persons and propelled by single paddles; but there were also a number of cruisers, including the Everson Nautilus, Chemaun (which last year cruised on the open ocean from Salem to Mt. Desert and appeared with the handsomest set of lateen sails ever seen on a canoe), a Stella Maris and a Birdie Kane (both beauties), Racine Shadow, St. Paul, Princess and decked canvas canoes of the Rob Roy and other models. Comparatively little sailing was done, and there were no regular races, but nobody found time hanging idly on their hands.

Saturday afternoon, the 14th inst., a fleet of seven canoes entered the rapids at Hunt's Falls and ran them successfully, but the water was low and one frail 25-pounder came to grief in midstream, while several of the paddlers got a trifle wet. Then the course lay through four miles of beautiful scenery until Deer Leap was reached and the camp established, with new recruits constantly paddling up. A huge tent sheltered twelve of the Vesper men and another somewhat smaller held those of the Crescent Club, while other tents of various sizes were soon set in a semi-circle around the camp ground, and two canoes were turned into sleeping quarters. Flags were, of course, run up, and a mammoth A. C. A. burgee floated on the breeze.

Upward of thirty canoeists were seated about a grand camp-fire in the evening, and a jolly time they had, some remaining up until midnight. Banjo playing, stories, songs and jokes enlivened the hours, and nobody seemed in a hurry to turn in. But tugs of war and a general frolic at last proved too much for endurance and sleep was in order.

Four o'clock found many up and, breakfast over, a quiet day was spent in paddling or sailing on the river, bathing and exploring the neighboring woods. Late in the forenoon two new canoes paddled up to the landing and everybody gladly welcomed Mr. John Boyle O'Reilly, a canoeist of note, and his friend, Mr. Fred J. Stimson, both bronzed by a cruise on the Charles and Concord rivers. They were at once tendered the hospitalities of the camp, and remained until after dinner, when they were obliged to leave and paddle on to Lawrence, much to the regret of all. New arrivals were reported at intervals, and during the afternoon the camp was graced by lady visitors, while many of the boys came down from the city on bicycles, in carriages and on horseback.

Some amateur photographers were present and views were taken. Toward night most of the Lowell men returned home, and the evening was quietly passed around another camp-fire. Monday, those remaining broke camp and set sail for Lawrence, two canoes, Chemaun and Clytie, cruising down the river to Newburyport and around the coast to Salem, where they arrived early Thursday morning.

Canoeing in the Merrimack Valley differs somewhat from that at points further west, but the sport is steadily growing and the "meet" seemed to stir up quite an enthusiasm, so that the experiment will doubtless be repeated at a later date with even more satisfactory results. CLYTIE.

A. C. A. OFFICIAL PROGRAMME OF RACES.

TUESDAY, Aug. 12, 1884.

PADDLING Race, Class II., 9:30 A. M., distance 1 mile. Length not over 16ft.; beam not under 26in.

Sailing, Novice, any class canoe, 10:30 A. M., distance 1½ miles. Canoeists who have never sailed a canoe before 1884.

Paddling, Class III., 11:30 A. M., distance 1 mile. Length not over 17ft.; beam not under 28in.

Sailing, Class A. and B., 2 P. M., distance 3 miles. No limit as to trim or rig. Start 10 minutes apart. A.—Length not over 16ft.; beam not over 38in. B.—Length not over 17ft., with a limit of 28½in. beam for that length. Beam may increase ¾in. for each 6in. length decreased.

Paddling. Tandem, 4 P. M., distance 1 mile.

Upset, decked canoes, 4:30 P. M., ¼ mile.

WEDNESDAY, Aug. 13, 1884.

Paddling, long distance, 4 P. M., distance 3 miles. Not under 27in. beam and not over 16ft. long.

THURSDAY, Aug. 14, 1884.

Paddling, Class I., 9 A. M., distance 1½ miles. Length not over 18ft.; beam not under 24in.

Paddling, Class IV., 9:30 A. M., distance ½ mile. Length not over 16ft.; beam not under 30in.

Sailing, Class A. and B., cruising, 10:30 A. M., distance 3 miles. Start together. A.—Not more than 50 sq. ft., any ballast. B.—Not more than 50 sq. ft., any ballast.

Paddling and sailing combined 1 mile each way, 2 P. M., distance 2 miles.

Sailing, light race, canoes A. without ballast; canoes B. with heavy board only, 3 P. M., distance 1½ miles.

Hurry Skurry Race, 100yds. dash for choice of boats, distance 220yds.

Canoe gymnastics.

WM. WHITLOCK, Chairman,
E. B. EDWARDS,
L. Q. JONES. } Regatta Committe.

NEW YORK C. C. ANNUAL REGATTA.

THE N. Y. C. C. held their annual regatta on Saturday last on New York Bay, off New Brighton. A tent was erected on the bluff above the beach, under which the friends of the canoeists were seated, with the course in full view, while a number of oarsmen in singles and fours were pulling about the start. Com. Whiting was also on hand on his little gig.

The first race was for Class A, sailing, Class B, sailing, and junior race, the entries being:

CLASS B.

Guenn	Com. Whitlock	N. Y. C. C.
Dot	C. B. Vaux	N. Y. C. C.
Surge	H. O. Bailey	N. Y. C. C.
Freak	C. V. R. Schuyler	N. Y. C. C.

CLASS A.

Siren	R. B. Burchard	N. Y. C. C.
Psyche	Vice Com. Munroe	N. Y. C. C.
Ripple	E. C Delavan, Jr.	N. Y. C. C.
Pathfinder	J. J. Fraser	N. Y. C. C.

JUNIOR CLASS B.

Minx	M. V. Brokaw	N. Y. C. C.
Theresa	F. E. Reade	N. Y. C. C.
Pirate	A. K. McMurray	West Brighton.
Fanny	S. B. Crane	Jersey City.

The course was from the float out to Buoy 17 and return, 2½ miles, the tide running a strong flood, with very light southwest wind. At 3:32:30 the canoes were started, all lying head to wind and hoisting mainsails at the signal. At the start Pirate ran into first place and was soon ahead, wing and wing, Surge was to windward, Freak next. The tide set them all well up, there being too little wind to stem it rapidly.

At Buoy 17 Dot and Guenn rounded together at 3:56, the former having rather the better of it, while Pirate was third and Freak fourth. On the beat home all set well up, Dot coming in ahead, but when near the line being becalmed and lying there. Guenn and Surge now came up, the latter crossing the line first, with Dot second, Guenn third. Times: Surge, 4:35:30; Dot, 4:38:00; Guenn, 4:38:30.

In Class A, the boats were carried far to leeward, Ripple leaking badly and being unmanageable. Siren and Psyche, finding no wind, gave up and paddled home. In the junior class Pirate came in first.

The second race, sailing and paddling, was omitted, as there was no wind at all.

The third, a paddling race for Class III., distance 1 mile, brought out:

Neversink	E. Gould	K. C. C.
Siren	R. B. Burchard	N. Y. C. C.
Psyche	C. K. Munroe	N. Y. C. C.

Psyche and Siren are both of the old Nautilus model, Neversink being a St. Lawrence, both smaller and lighter. Psyche led at first, dropping into second place and finish two lengths behind. Time: Neversink 5:28:15, Psyche 5:29:00, Siren 4:29:15.

The next race for Class IV., paddling, ½ mile, brought out the following men and boats:

Surge	H. O. Bailey	N. Y. C. C.
Guenn	Com. Whitlock	N. Y. C. C.
Dot	C. B. Vaux	N. Y. C. C.
Pirate	R. K. McMurray	West Brighton
Theresa	E. Gould	K. C. C.

Pirate took the lead at start, 5:44:55, with Dot pushing him close, Theresa third, pulling a good race, but stopping short about 50yds. from the line, Dot then being astern of him. Dot came in first, 5:48:06, Neversink 5:48:07, Surge third.

The tandem race, over the same course, had three entries: Freak, Schuyler and Drake; Dot, C. B. Vaux and D. Vaux; Siren, Burchard, and Whitlock. At 6:07:28 all got away well together, Freak, however, soon taking the lead with Dot second. The race was well pulled Freak coming in first at 6:10:20, Dot 6:10:29.

Of course the most amusing race for the spectators was the upset race, for which Lark, C. B. Vaux; Neversink, E. Gould, and Siren, W. Whitlock were entered, the Lark proving the winner. Prizes were awarded to the winners in each race.

TORONTO C. C.

THE Toronto C. C. have had two races for the new cup. We copy from the Toronto *Globe* the following:

"The members of the Toronto C. C. had their first race of the season on Saturday, May 31. It was a sailing contest for the new Running Cup. In sailing for this cup the course is chosen in such a way that there is no close-hauled sailing. Six canoes entered, as follows: John L. Kerr, in Mr. A. H. Mason's new canoe; Frank M. Nicholson, Sadie N; Robert Tyson, Isabel; Hugh Neilson, Boreas; Fred W. Mason, Whimbrel; J. T. R Stinson, Racine Shadow.

"There was a fresh breeze from the eastward, and the course lay from the foot of Lorne street to the yacht Alarm, moored near the Island, and back again twice over, a total distance of about seven miles. The canoes got off in good style, and approached the first turn in the order above given, except Mr. Stinson, who did not start. Mr. Kerr had a splendid lead, and was just rounding the Alarm when his tiller-line gave way and he had to retire from the race. Sadie N. and Isabel were a little slow in rounding the mark, enabling Boreas to cut in neatly and take the lead from them. The little craft went tearing and splashing back through the lumpy water under all the sail they could carry. Boreas had a reefed racing mainsail; Isabel and the new canoe carried full cruising sail; Sadie N. and Whimbrel were under reefed cruising canvas. Arrived at the city front again, the canoes performed safely the ticklish operation of jibing around the northern mark Mr. E. Leigh's canoe—in this order: Boreas, Isabel, Sadie N., Whimbrel. These positions were unchanged to the end. There was not more than ten or fifteen seconds difference in the arrival at the goal of the three leading canoes. Following are the prizes: Heigh Neilson, Running Cup and Atwood centerboard; Robert Tyson, spirit stove; Frank M. Nicholson, pocket knife; Fred W. Mason, prize given by commodore.

"The canoe Mr. Kerr sailed in was built recently for Mr. A. H. Mason by Mr. John Clindinning, and Mr. Kerr is so much pleased by her performance that he at once ordered a similar one from Mr. Clindinning. As soon as she is ready he will challenge Commodore Neilson for the Running Cup."

Boreas has had her after centerboard replaced during the winter, and is much improved. Isabel carried her new fan mainsail.

Another race was sailed on June 7, with the following entries: Isabel, Robert Tyson; Boreas, Hugh Neilson; Whimbrel, Fred W. Mason; ——, A. H. Mason. The course was from the foot of Lorne street to Block-house Bay, twice over, making nine miles. Boreas took the lead and held it throughout, winning by three minutes, with Isabel second, the others withdrawing. The course was a reach out and back, and the passing steamers interfered greatly with the racers. Isabel used her balance lug in this race.

ROYAL C. C.

THE annual race for the challenge cup came off at Hendon on Saturday, May 31, when one of the most interesting contests witnessed for years took place, and, we believe, the fastest time on record scored for the ten miles, viz., three minutes under two hours. This, considering that half the distance was dead to wind ward, is undeniably a creditable performance for such small craft.

Race for first class canoes; course, five times round a triangle marked by buoys, leaving all marks on the port hand, and finishing between the raft and a post on opposite shore. Prize, the challenge cup, value £50, tenable for the year, and a presentation prize, value £5. Entries: Violet, Mr. W. Watney; Merlin, Mr. E. G. Wilkinson; Teaser, Mr. W. Baden-Powell; Imogen, Mr. H. Church; Gladys, Mr. T. F. Knowles; Irene, Mr. Dan Ashton; Pearl, Mr. A. H. Tredwen; Anonyma, Mr. R. H. Harrison.

Mr. E. B. Tredwen, the holder of the cup, being abroad, it was generally expected that his brother would sail the Pearl; he, however, did not put in an appearance, much to the disappointment of the spectators. Anonyma was also an absentee. At the start, 3 P. M., the wind was N.E., making it a close haul in to the N. buoy in the bight, and a run on starboard tack from thence to the lower buoy. All got away pretty much together, with the exception of Gladys, who kept more in the center of the lake for the breeze. Violet, Gladys and Merlin rounded the first buoy in close order, Violet running Gladys a little from thence to the bottom, Teaser setting a spinnaker to starboard and scuttling along at a rare pace in pursuit. Imogen drew away gradually from Mr. Ashton's new boat, which seemed over ballasted and sluggish, and troubled with a mizzen of little or no use to her. In the turn to windward up the lake Gladys and Violet had a hot tussle of it, Violet just getting a start and completing the first round a bare second to the good. Teaser, a diminutive 18-footer of doubtful age, and with a huge balanced lugsail, was being cleverly sailed, and had worked into third place, Imogen, Irene and Merlin following in the order named. In the next round Violet, for some unaccountable reason, fell off all together, and Gladys was timed one and a half minutes ahead of Teaser, who by this time had worked into second place, and looked like wresting the lea from her larger rival ere long. In the third round, however, she got ashore for two or three minutes, and Gladys increased her lead as the rounds were ruled off, as the annexed times will show, Mr. Knowles securing a popular and well-deserved win at 5:57 P. M.

	1st Round	2d Round	3d Round	4th Round	5th Round
	H. M. S.	H. M. S.	H. M. S.	H. M. S.	H. M. S.
Gladys	3 36 01	4 11 00	4 45 30	5 21 00	5 57 00
Teaser	3 37 45	4 12 30	4 50 30	5 28 00	6 03 00
Violet	3 36 00	4 14 15	4 51 00	5 32 00	6 07 00
Imogen	3 40 00	4 16 00	4 55 00	5 37 00	Not timed
Irene	3 42 00	4 16 30	4 57 00	5 40 30	Not timed
Merlin	Retired.				

—London Field.

THE FAN MAINSAIL.

A FELLOW canoeist of mine in Toronto, who is a staunch advocate of the balance lug, as against Mobican sails, fan sails and such like devices, accuses me of incorrectness and exaggeration when I say that my new fan mainsail "is the lug," and he thinks I am attacking the old Chinese favorite.

But I too am an admirer of the balance lug, and as a matter of fact use it for my racing sail. That, however, is no reason why we should not try to get a better sail than even the balance lug—if we can. Every sail to be reefed when running, must have at least a halliard and a reef line. Then in addition to that, a balance lug ought to have two additional ropes—a topping lift and a jackstay.

The published drawings of my sail show also two additional ropes—a hoist and and a guy. But these ropes are unnecessary in the improved form of my sail, and I shall not use them again. Up to the present I have left these two extra lines on the sail, because they have not bothered me, and I have been too busy to take them off. Then, the reefing gear needed for the fan sail contains about half the lines and blocks necessary for a balance lug reef, because no line whatever is necessary at the luff of the sail.

Take the Dot gear, for instance, which is one of the simplest balance lug reef gears. An adaptation of the Dot gear to the fan sail would contain only the double leach line, married under the boom, and carried direct to mastfoot and skipper's hand. My published drawing shows more reef gear than is absolutely necessary.

In writing the paragraph of June 5, I had in my mind the improved form of the sail, which has only halliard and reef line. I submit therefore respectfully, but firmly, that the improved sail has "less gear than the balance lug;" not expressing an opinion as to whether I was justified in using the wicked little adverb "much!" ROBERT TYSON.

ANOTHER REEFING LATEEN.

Editor Forest and Stream:

I have been turning over in my mind for the last few weeks how I could make a lateen sail for my Rice Lake canoe that should be reefable with very little trouble. I matured my plan some little time ago, and have overcome the difficulty of having the center of effort too high by being enabled to use the usual four-foot mast.

I found your correspondent "Long Shanks," has almost anticipated me in your issue of the 12th inst., by publishing his plan. Canoeists will, however, find my plan the easier worked, as it has only one rope to handle besides the sheet.

My chief difficulty was how to get the peak down. This I have overcome. I believe my plan of sail reefing will be of much benefit to canoeists, and I have much pleasure in offering it to them. I think they will coincide with me in believing this to be the easiest plan for reefing published. I am just having a sail for my canoe, which is 15ft. long, fitted up, and it will contain 45ft. of cotton.

The boom and yard are hinged together at their forward ends, the former having, in place of the usual jaw, a steel spring holding it to the mast. A parrel of copper wire 2ft. 3in. long is lashed at both ends to the yard, the lower end being 3ft. from the end of the yard, the upper end, of course, 4ft. 3in. This parrel holds the yard firmly to the mast, and is long enough to allow the yard to move in reefing. A single halliard serves to hoist and lower the yard, the sail being taken in by the usual reef points. C. O. D.

LONDON, Ont., June 16, 1884.

PATCHING CANVAS CANOES.

Editor Forest and Stream:

To patch holes or rents in canvas canoes at once, without waiting to heat pitch or caulking mixture, I have heard of using "porous plasters." Is not this a step from the sublime to the ridiculous? Last summer, while my canvas canoe was on a steamer's deck as freight, a great deckhand deliberately sat down on the deck of the canoe, as he afterward said, "to see if it would bear him." It didn't. Next day I had a new deck beam to put in. As a precaution against this, a simple device is a stick exactly a tight fit in length between top of keelson and under side of deck timber. Hinge one end to deck timber underneath, and when not in use hook up to deck. When freighting canoe, drop stick and jam tight between keelson and deck, and freight fiends may then sit on deck with impunity if owner is absent.

PHILADELPHIA, Pa. F. H. S.

A. C. A. ANNUAL MEET.—The New York, Ontario and Western Railway offer to sell return tickets from New York to the Thousand Islands for $15, and to transport canoes and kits free. There is but one transfer, at Oswego, from the cars to the boat, a short distance. The general passenger agent, Mr. Anderson, writes us that there need be no fear of canoes being handled roughly because carried free, but that they will receive the best possible care. Trains leave New York at 6:50 P. M. and 8:30 A. M., arriving at Oswego at 7:50 A. M. and 9:55 P. M.

BAYONNE C. C.—This club, established in 1881, now has a house at Bayonne on Newark Bay, and some ten canoes, both cedar and canvas, many of them being built by their owners. On Thursday of last week the club gave a dramatic entertainment in the little theatre of the Bayonne Boat Club, the performance including vocal and instrumental music, and a farce "The Little Savage," after which the hall was cleared for dancing. The club will hold their spring regatta on July 4. Mr. E. Smith is commodore, and Louis F. Burke secretary.

RONDOUT C. C.—Will spend July 4, 5 and 6 in camp on Esopus Island. On the afternoon of the 4th they will receive their friends from Rondout and entertain them with impromptu races, open to all comers. A. C. A. men will be welcomed to the camp, and it is hoped that those in the near vicinity will come in force.

ANOTHER NEW CANOE CLUB.—A canoe club was organized in Taunton, Mass., with nineteen members. The officers are: Commodore, T. R. Breed; Vice-Commodore, C. L. Bryant; Purser, Wm. Y. Fox. The burgee is 10x15 inches, a blue field with the white letters T. C. C. in white.

PITTSBURGH C. C.—This club propose to cruise down the Monongahela River from its head, spending several days at Lake Chataqua, several of them going also to the A. C. A. meet.

ALLEGHENY C. C.—This club will visit Conneaut Lake next month, going by rail to Meadville, sailing down French Creek and the Allegheny River to Pittsburgh.

CANOE PHOTOS.—We have received Photos of the Newburgh camp from Messrs. Jones, Seavey and Van Deusen.

OTTAWA C. C.—We have received a copy of the constitution, with sketch of the flag, from Captain Baldwin.

Answers to Correspondents.

W. C. M.—See note from Rice Lake in our fishing columns.

INVALID SPORTSMAN.—There is a letter for you at this office.

J. J. S., New York.—Write to the Secretary of State, Lansing Mich.

CLAY, Solomon City, Ark.—See advertisement of the clay-pigeons elsewhere.

YACHTSMAN, N. Y.—For receipt for whitening see FOREST AND STREAM for Sept. 13, 1883.

L. N. S., St. Louis, Mo.—We understand the word "Shack" to be a Dakota local term for cabin.

H. B.—For information about the Adirondacks see article on page 362, in our issue of June 5, 1884.

D. C. S., Buffalo, N. Y.—See FOREST AND STREAM for NOV. 8, 1883. Will be pleased to hear from you.

C. W. M., South Berwick, Me.—Hallock's "Sportsman's Gazetteer" is the best book for your purpose.

E. C., East Hampton, Ct.—We do not consider it a "good practice" to dock the tails of setters and pointers.

S. D., Mercersburg, Pa.—Can you inform me through your valuable paper where I can procure an army knapsack, such as is now used in the army? Ans. Apply to Hartley & Graham, Maiden Lane, this city.

INQUIRER, Buffalo.—It is explained by the fact that the author wrote "marsh wren," not "marsh hen"—p. 344, 3d col., line 55.

A. H. A., Buffalo, N. Y.—The depth inside from center of deck to garboards at side of keel must not exceed sixteen inches.

L. H. R., Brooklyn, N. Y.—See FOREST AND STREAM for Sept. 27 and Oct. 4, 1884. One sail is not suitable, two, as shown, will be better.

M. S., Falmouth, Mass.—"The American Yacht List" is just ready. We can furnish it and the other book you ask for. The prices are $3 for the former and $4.50 for the other. 2. The expression is not correct, but is in common use.

J. T. B., Ridgewood, L. I.—1. Is there any way of preserving birds without taking the pelt off and then stuffing it? 2. I would like to know what preparation is used to preserve flowers their natural color, or can I get a book that will give me a thorough knowledge of stuffing birds and preserving flowers? Ans. 1. There are various preparations for preserving birds without skinning, but none of them are altogether satisfactory. It is much better to learn how to skin the specimens. Dilute carbolic acid injected into the body will preserve small specimens for a considerable length of time, so will a solution of bi-chloride of mercury (corrosive sublimate), so will the Wickersheimer fluid, the formula for which was given in FOREST AND STREAM for NOV. 4, 1880. 2. We know of no method of permanently and satisfactorily preserving flowers as you wish. We have seen blossoms covered with perfectly dry white sea sand, and allowed to dry, which retained their shape perfectly, and in some cases their color, but the dried blossoms were very fragile. To learn how to stuff birds, get Manton's "Taxidermy Without a Teacher," price, 50 cents, or Batty's "Practical Taxidermy," price, $1.50. We can send both.

F. H. S., Philadelphia, Pa.—The proper position for the centerboard is a little forward of midships, but in a canoe it must sometimes be placed further forward in order to allow room for sleeping. The only difference in this case is that less after sail is needed. 2. You have no right to copy any patented article or process.

W. A. W., New York.—What waters within a short distance of this city is there good fishing in the months of July and August, and are open to the public? Ans. Greenwood, Croton, Wawayanda, Hopatcong and Rockland lakes. The Hudson, Passaic, Hackensack and Shrewsbury rivers, as well as other waters about the harbor.

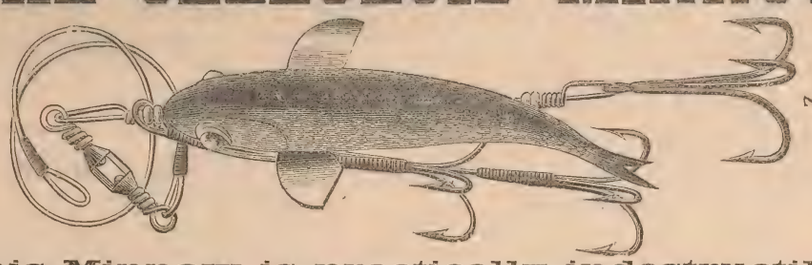
C. F. K., Ashland, Wis.—Do the laws of Maryland forbid sportsmen shooting duck from sink boats or bushwhacking, between Nov. 1 and April 1? Ans. There are many local laws on this subject. Write to Edwin Schenck, Esq., 243 St. Paul street, Baltimore, for the digest prepared by the Maryland Association for the Protection of Game and Fish, of which he is secretary.

J. R., Battle Creek, Mich.—1. I have invented a rod holder, which is clamped to the gunwale of a boat. It has a socket which allows the rod to be set at any inclination and to revolve about the boat. I drew the model, but have done nothing more. A man has stolen the idea from my drawing and is trying to get ahead of me in the patent. Is there much value in the design? 2. Shall I go to law? Ans. 1. Very little, if any. 2. No.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, and POULTRY.

FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Breeders, Livery Stable and Turfmen, Horse Railroads, Manufacturers, Coal Mine Companies, Trav'g Hippodromes and Menageries, and others handling stock, with perfect success.



Humphreys' Veterinary Manual, (99 pp.) sent free by mail on receipt of price, 50 cents.
☞ Pamphlets sent free on application.

HUMPHREYS HOMEOPATHIC MED. CO.
109 Fulton Street, New York.

NERVOUS DEBILITY

HUMPHREYS' HOMEOPATHIC SPECIFIC No. 28, Vital Weakness and Prostration from over-work or Indiscretion, is radically and promptly cured by it. Been in use 20 years, —is the most successful remedy known. Price $1 per vial, or 5 vials and large vial of powder for $5, sent post-free on receipt of price. Humphreys' Homeo. Med. Co. (Illust. Catalogue free.) 109 Fulton St., N. Y.

THE CELLULOID MINNOW.

This Minnow is practically indestructible.

Mounted in the most substantial manner on hooks particularly adapted to AMERICAN WATERS. This cut shows the exact size of a No. 7. We keep the following sizes in stock:

Nos.	4	5	6	7	8	9
Inches long	2	2¼	3	3½	4	4½

If your dealer does not keep our goods in stock, or will not order them for you, send 50 cents for our 120-page illustrated catalogue.

Harrison's Celebrated Fish Hook.

Registered.

Trade  Mark.

Whereas, It having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and **we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours,** which are to be obtained from the most respectable wholesale houses in the trade.

Signed, **R. HARRISON, BARTLEET & CO.,** Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England.

Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

Refrigerator Baskets.

The grandest thing ever invented for fishermen or for parties living out of town, as articles of a perishable nature can be carried around all day in the hottest weather and will be kept cold as ice. These baskets being lined with tin and packed with boiler felt are perfect portable refrigerators, preserving the contents and giving plenty of ice-water for drinking purposes. They are made of the best rattan, with drop handles, double lids and straps on top, and are the strongest and most handsome baskets ever made. Two sizes. Price $3.50 and $4.50. Sent by express on receipt of price by the patentee, JOHN R. HARE, 63 Fayette street, Baltimore, Md.

Pittsfield, Mass. Cuts Free

Full-Length COT, in this case, $10. LOUNGE, in this case, $8. Sold everywhere by the Trade.

JAS. F. MARSTERS,

55 Court Street, Brooklyn.

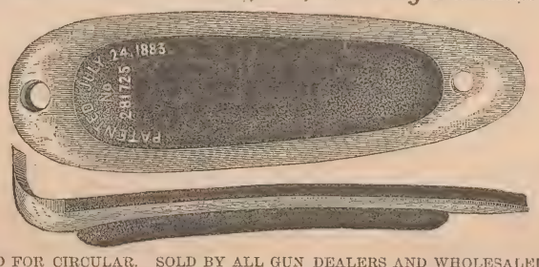
Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S
Patent "Perfect" Brass Shells,



MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, yachting, canoeing, and kindred subjects, than is contained in all other American publications put together.

A USE FOR SAWDUST.

IT is generally easier for a mill owner to dump his sawdust into the stream for the water to wash away than it is to burn it or cart it off. The sawdust kills the fish in the stream, but he would be an idiotic mill owner who would permit such a public loss to interfere with his private gain; and so he dumps the sawdust, kills the fish, puts his hands into his pockets, and asks the public "What are you going to do about it?" The States have enacted laws forbidding this disposition of sawdust and prescribing penalties for the offense, but the offenders usually manage to ignore the law or evade it entirely. Thousands and thousands of streams which once harbored excellent food fish have been ruined by the sawdust. In the last report of the New York Commissioners of Fisheries it is stated that "of all causes there is probably none that has exerted such an influence in expelling both salmon and trout from our spring streams as the presence of sawdust;" and the Commissioners go on to state that although there is a statute governing this, it is practically useless because carelessly worded.

The destruction of fish is not all that the sawdust must answer for. It kills human beings. Waters polluted by decaying sawdust spread malaria, and make miserable the lives of those who dwell on the banks of the plague-bearing stream. This is notably the case with the Raquette River, whose whole lower course is cursed with chills and fever; and Potsdam, where one of the State Normal schools is located, has become a very undesirable place of residence from this cause.

When urged to burn, or in some other way dispose of their sawdust, lumbermen have objected that they could not afford the cost. There is hope that the perplexing problem of dealing with this nuisance may now be solved, for a process has been discovered by which the refuse sawdust may be made to yield a handsome profit. When dry it is carbonized in iron retorts, and in the process there is given off 80 per cent. of volatile products, the remaining 20 per cent. being granulated charcoal, which can be used in making gunpowder, filters, lining refrigerators, and as a disinfectant, and mixed with a little tar it could be pressed into bricks and used for fuel; 22 of the 80 per cent. of the volatile products are in the form of fixed gases, which can be used for heating, lighting, etc.; 47 per cent. is pyroligneous acid, which is crude acetic acid, and after being purified and concentrated is used in white lead, color, print and vinegar manufactories.

There remain 10 per cent. of tar and one of wood alcohol. The tar has the same properties as coal tar, the almost endless uses of which, such as pitching roafs, lining water tanks, covering the bottoms of vessels, protecting iron from rusting, covering the wounds made in pruning trees, and in the form of benzole, naphtha, carbolic and sulphuric acids, and the whole splendid series of aniline dyes, constitute one of the chief glories of modern chemistry. The wood or methylic alcohol is used as a solvent for gums, in varnish making, in the manufacture of aniline colors.

The sawdust from yellow pine and other woods rich in resin, yields also a considerable amount of turpentine, in gathering which so many trees are every year sacrificed.

It is estimated that in sawing inch boards of pine, hemlock, etc., the one-fourth inch saw-kerf uses up one-fifth of the log. When lumber is sawed by the billion feet, one can easily see that the question of disposing of the sawdust in a way to yield a profit, instead of a first-class nuisance, is a very important one.

THE OLD SWAMP.

HOW many years it had been there no one knows. Perhaps it was only one of the minor depressions left in the surface of the earth after the passage of the great glacier, that swept over the land that is now ours when the race was young. Then our ancestors dwelt in caverns—true troglodytes—and slew the reindeer and the hairy mammoth and the horse, and perhaps now and then had fierce conflicts with the huge cave bear, which they conquered by their courage and their numbers, rather than by the excellence of their rude stone weapons.

Or it may have been once a broad valley, down which hurried a sparkling brooklet, which twisted and turned, winding from one side to the other of the level meadow; here rippling in a yellow current over the smooth pebbles of the bottom, there burrowing its way beneath overhanging grassy banks, where its soft murmur alone told of its presence; or again making some sudden crook and digging out for itself a deep, quiet pool, where the trout used to lie in summer, and in which the silent otter was always sure to find a meal. Then, perhaps, a little family of beavers passed that way, and seeing the brook and its possibilites determined that they would make it their home. So they began, by cutting down some of the trees that grew by the brookside, to build their dam. They brought mud and stones from the bottom of the stream and with their chisel-like teeth clipped off the willows and alders, and cut them into lengths, and their patient and unremitting industry finished the dam by the end of summer. Now a good part of the meadow was a wide but shallow pond. Next the houses were built and the winter supply of food laid up, and, not long after this, the pond froze over.

For years, perhaps for centuries, the colony of beavers remained here, always becoming more numerous. Sometimes they moved up or down the stream, and every few years they built new dams, and overflowed more of the low land. Those that they had first deserted had long ago rotted and broken down, and the ground which had first been grassy meadow, and then the bottom of the pond, was now a wet marsh, in which grew young alders and willows and bilberries, soft maples, cypress and tamarack, and a hundred other moisture-loving trees, while the foot of the passing deer sank deep into the spongy sphagnum or crushed the showy yellow lady-slipper and the delicate pink arethusa. As the years went by the forest growth increased in size, while the smaller shrubs beneath formed a tangled mass, impenetrable save to the wild creatures which made their home among the luxuriant vegetation.

However it was formed, such was the old swamp.

Here during the summer, before the berries were ripe, the black bear dug roots, and tore up the rotten logs or turned over great stones, for the ants, worms and bugs on which he lives. The deer browsed on the water grasses and in winter nipped the tender shoots of the willows. The raccoon hunted frogs in the wet places, and at the approach of autumn grew fat on the thick-growing clusters of fox grapes, made sweet by the early frosts. All the other denizens of the forest found here a safe retreat, from which they made excursions out into the surrounding hills.

So it was with the old swamp when our fathers first took possession of the soil. Game was plenty then, and a man, when he needed meat, had to go but a short distance from his own door to kill a deer or a turkey. But as time went by, fire and the axe cleared away the timber from the surrounding hills. The hunter gave place to the husbandman. The sickle supplanted the rifle. Now the game had become less plenty. Birds there were, it is true, but the larger game had disappeared from the land, except in the old swamp. That was as it had always been. The settlers had been busy, and it was the clearing of the land, rather than the actual destruction of animal life, that had driven off the game. Now and then a hunter had penetrated the tangle of the swamp in pursuit of a wounded animal, but its interior was still a mysterious unknown to all.

Within its gloomy recesses there was not much change. Here the bear was still to be found and the deer fed there almost unmolested. The turkey gobbled in spring as of old and the ruffed grouse stalked among the trees with majestic tread. The pigeons still gathered here to roost, and the thunder of their wing beats at morning and at evening was like the rushing of a mighty wind through a ship's rigging.

It was to the old swamp that the hunters resorted now for game, and often the sharp crack of the rifle rang among the trees or the roar of the shotgun awoke its once silent echoes. The angler pushed his way down the course of the stream and caught the trout. One began to find paths in the swamp that were not game trails.

A few more years passed by with rapid changes. The axe had been at work. Now all the timber had been cut away, but there was still left the undergrowth. Deer and bear and turkey and wild pigeons had disappeared, but there were some grouse left, and the quail, when startled from the stubble fields about its borders, still sought safety in the old swamp. The closing change in the old swamp was yet to come. Trenches were dug through the swamp. The brush was cut down and burned. The brook dried up. The plow passed over the land, and the next year a crop of sod corn was grown where once the beaver had their homes. Such is the history of many an old swamp.

All this is progress—the march of improvement. It is also the reason why our streams are drying up, and why the farmer complains that each year there is less rain, and it is a harder matter to grow crops. It explains why our rivers are gradually becoming more and more shallow, why the water-power that turned a hundred mills, now turns none and is replaced by steam. It is something that is taking place all over our country. The clearing up of each swamp like this one is a misfortune to our people, and the aggregate of such misfortunes means a loss of material wealth that can scarcely be computed. This loss is widely distributed, and is not felt as it comes, but it increases year by year. The farmer knows that his land becomes each season a little less productive, but he does not know why. Perhaps he thinks that it is worn out, and strives by the use of fertilizers to renew its old-time luxuriance. Vain remedy. Without water no amount of manure will make crops grow, but water will make fertile the sands of Sahara or the arid sage-brush wastes of our Western deserts. Has not the valley of the Great Salt Lake been made to blossom as the rose?

The story of the old swamp is told of no one locality. Each one of us has seen the work going on in his own neighborhood, has witnessed the disappearance of the native fauna and flora, the drying up of the streams. What will be the end?

SMALL BOAT SAILING.

TO those friends of small boats who have watched the limited entries and generally discouraging condition of the sport in and about New York, it will be gratifying to turn to the programme of races for the coming two weeks, issued by the Beverley Y. C., which we give in another column. The small yacht, as yet, has hardly a place in New York; on the one hand is the sandbagger, with which there is nothing in common; on the other, the large yacht, looking down contemptuously on the little ship, which, between these two, is left to sail alone.

Racing small boats, as formerly carried on here, with shoal boats, unlimited crews, and shifting ballast, is declining year by year, as is shown by the limited number of entries in such races of late, and it is bound to disappear entirely as the value of safety and comfort becomes more appreciated; but as yet there is nothing to take its place. A few clubs have

taken an advanced step and limited ballast and crew, and several races each year are open to such boats; but there is little encouragement given them, and their increase is very slow.

Looking in the East, however, we find a totally different condition of things, doubly encouraging, not only from the number of boats, but from their general good qualities.

The race of the Beverly Y. C. last August brought out 239 entries of all lengths from 60 feet down to 13. Only 21 of the 173 that started were over 30 feet, and most of the remainder were about 20 to 24 feet loadline. Of the 75 starters in the Hull Y. C. open race a week later but 12 were over 30 feet, most of them being nearer 20, and all honest, handsome and able little boats, whether cutters, sloops or cats. It is well worth a journey to South Boston to see the fleet at anchor there—several hundred little ships—small in size but trim and shapely in hull and rig, and each one representing a crew of at least two ardent sailormen; or, it is better yet to go in winter, when all the boats are hauled up, and when one can count the keels, the number increasing faster each year, while the centerboards are growing fewer, many lying ashore from season to season.

Of the general qualities of the boats now so common there, no better evidence is needed than a look over our late files. Vayu, Neva, Caprice, Fad, Carmita and the others there shown are but types of dozens of similar craft, whose names head each list of winners—Hera, Gem, Lily, Beetle, Banneret, Transit. If Boston can boast such a fleet, why is New York so far behind?

There is no lack here of suitable water. A draft of five to seven feet can be carried without difficulty, or if that is the trouble, less can be taken, while good qualities are retained. Certainly our sailormen are no less bold and daring or less skillful than their Eastern brothers, and there are builders who are competent to turn out such boats as would be needed.

Whatever the hindrance may be, the men interested must look only to themselves for its removal, they can expect neither sympathy nor help from the sandbaggers or the larger clubs, but must depend on their own exertions.

Several attempts have been made to form an association of boat owners, but all have failed, and at present almost the only clubs offering any inducements to owners of small fixed ballast craft are the Seawanhaka, Knickerbocker and New Jersey yacht clubs. An association is needed that will make a specialty of boats of thirty feet and under, prohibiting shifting ballast, limiting crews, and enforcing such rules as will encourage a true Corinthian spirit, and make it possible for a man to own a yacht and enjoy real sport, both cruising and racing, with a reasonable outlay of time and money. Such a club once established would never lack support, and its value would soon be appreciated by the larger clubs, whose constant complaint is a lack of amateurs for their Corinthian races.

RIFLE SHOOTING NOT DECLINING.

THERE is a cry going up from those who see only what lies on the surface, that rifle shooting in this country is on the wane, and that the sport of target practice is soon to die out. There is really nothing to justify any such croakings, and he who indulges in them is plainly a very short-sighted person. The only ground upon which such an assertion could be founded is that the newspapers are paying less attention to the subject and are allowing the marksmen to enjoy many a day of exciting rivalry without the accompaniment of notoriety. There was a time when every shot fired on the range at Creedmoor was duly entered in the next morning's journals; now a regiment goes out for its regular practice and may, perhaps, get a two-line notice in some of the papers. Publishing scores and making them are two entirely different matters. Even in the papers more particularly devoted to the sports of the field, there is a recognition of the fact that the score of each weekly practice match of each rifle club in the country may, with profit, give way to articles of general interest, in which topics of more permanent importance are discussed for the benefit of all.

It is, indeed, true that there is a lull in the sport of rifle shooting compared with the excitement which held sway several years ago. This is particularly true in this locality, where the international fever ran very high; but to-day, taking the country through, there is an abundance of rifle shooting, and on many a range scores of marksmen are getting all that delightful combination of work and relaxation which rifle shooting alone can bring. Persons of sedentary occupation still find a rare profit to weary brain and listless fingers in an hour or so spent with friends upon the lawn where the varying fortune of the mimic warfare help to keep the interest sharp and the rivalry brisk. These gentlemen do not seek to have their doings set forth in black and white through the press, but it is absurd to conclude from this that there is nothing going on.

The slovenly control which has been shown in the management of the Creedmoor range has done much to create this impression, erroneous though it be, that rifle shooting is on the decline. The range of the National Association seems destined to show its worst season in that of 1884. That this should be so is not at all surprising. The range has really, by the closing of the railroad which ran to it, been cut off from the metropolis, and is truly nothing more than an abandoned rifle range. There is a roundabout way of getting to the place, but it is so far removed in time and travel from this city that it has ceased to be looked upon as a practicable shooting ground.

What New York really needs is a convenient range for off-hand out-door practice. It should not be of less range than 200 yards, and we think that such a shooting park, properly located and equipped and liberally managed, would be a success as a private speculation. There is a good deal of nonsense, as we have at times taken space to say very emphatically, about the manner of practice pursued by the National Guard of this city and Brooklyn. The thousands of officers and men in the dozen regiments here organized would form a clientele to such a range as we suggest, and there would besides be a large outside patronage.

There are plenty of convenient spots about this city for the establishment of such a system of butts as would be required. We have no real estate scheme to further and therefore mention no localities, though an energetic man or company equal to the occasion would soon find the spot, and a moderate outlay would fit it up safely for the work in hand. Such an open air gallery could be made an attraction to any popular resort, and with it Creedmoor would soon be given over to its ante-range condition of daisies and desolation. It is a magnificent range, but if it cannot be put in use, an hundred instead of a dozen miles may as well separate it from this city.

We only repeat, then, that because Creedmoor has been made the victim of a dog-in-the-manger management is no reason for thinking that all is blue in the rifle shooting horizon. We need civilian marksmen to keep our regular and militia army shooters up to their work, and that need, we think, will always be supplied.

STARVING TO DEATH.

THE brief dispatch in Monday's papers from the Piegan Agency in Northern Montana was probably read by but few of our readers. Even to those who saw it, it did not mean much. Northern Montana is a long way off, and besides that the Piegans are "only Indians." This is what the dispatch says:

HELENA, Mon., June 30.—Major Allen, Piegan Indian Agent for Northern Montana, reports that the Indians are dying fast from starvation, the food supply at the agency being very scant. The carpenter has furnished thirty coffins in the past month, but it is believed that the deaths are fully thrice that number, as the Indians have a great dislike to burying their dead, preferring the old custom of placing the bodies in trees or in stone piles on high hills. The death rate is greatest among children from five to twelve years of age. In another week the supplies will be entirely exhausted, and the 3,000 Indians on the reservation will be left to starve, or subsist on the cattle of the settlers. Trouble is feared.

If now we had heard that in some town down in Mississippi or up in Minnesota, three thousand people were perishing of hunger, we should, probably, feel somewhat interested. The mayors of cities would be telegraphing to each other, consulting what measures had best be taken to relieve those who were in need. The daily press would publish appeals, and call for subscriptions, the Federal Government would place its servants and its supplies at the service of the relief committees. But these Piegans are "only" Indians—let them starve.

It is true that the Indian does not enjoy starvation much more than the white man does, and while he takes little pleasure himself in dying of hunger, he is even less contented to watch his hollow-eyed squaw as she sits beside the robe on which lies his poor little miserably starving child. The little ones go first. They are the weakest of the tribe; if they are without food they must perish. The women are stronger and can endure more, and the men have still greater powers of resistance. So we find, naturally enough, that the mortality is greatest among the children from five to twelve years of age. Poor little things; we can't help feeling a little sorry for them. Not that they are dying—that is rather a subject for congratulation than for pity; but that they should suffer so while they are dying. However, they are "only Indians."

The Piegans have for a long time been in a most miserably destitute condition. The buffalo on which they have always depended have been destroyed and they have now literally no means of support. They are not in any sense an agricultural people, their sole food being meat, with the wild berries, which they gathered and dried. But the game is gone, and with it, unless immediate assistance is given, must go this pitiful remnant of a once powerful nation.

We do not know who it was that in bitter sarcasm first called the Indians the "wards of the nation." They are such wards as Mr. Squeers had in his school, or, to come down to actual and recent facts, such "wards" as Shepherd Cowley had in his "home" in this city, and starved to death there.

We do not profess to be sentimentalists. We know the West and the feeling there as well as we do the East. We have traveled and lived and fought with Indians. We know what they are better than ninety-nine out of every hundred men, be they Eastern or Western. The Indian is a human being like the white man, he loves his wild free life as well as we love our life, his wives and children as well as we do ours. He has his pleasures and sorrows as well as we. The treatment of the Indian by the United States Government has always been shameful, and the disgrace which attaches to us on this account can never be effaced, and is only paralleled by the way in which the British Government treated the East Indians Each year adds to the grievousness of the injustice with which these peoples are being treated. We have fairly conquered them in war, and have driven them on to their reservations, and now we keep them there to starve. What would be thought of a man who drove a lot of steers into his corral or barnyard, and kept them shut up there without food? The law would be invoked to punish him without delay, yet this is what we are doing with the Indians.

What recourse have these people? What hope have they? Surely it is better to break out, to raid the settlements, to have the excitement of war, even if they die in battle, than to perish miserably of starvation on the reservation. If they do break out, at least they will have plenty to eat, for are not the Montana prairies covered with cattle? No wonder trouble is feared. Perhaps some one up there remembers the Cheyenne outbreak a few years ago, when the terrified Indians fled from the reservation in the Indian Territory to which they had been moved, and crossed Kansas and Nebraska, perpetrating atrocities too frightful to be mentioned on the families of the innocent settlers, and killing men, women, children and cattle. Why should not the Piegans in Northern Montana do the same? No wonder "trouble is feared."

Even now it is not too late to avert this imminent danger. The Interior Department should, without delay, telegraph the agent to purchase the supplies necessary to temporarily relieve the suffering of these people, until some measures can be taken for their permanent relief. But the case is pressing, and aid, if to be of use, must be given at once.

SUMMER SHOOTING.

THE first editorial on game in the first number of FOREST AND STREAM, published nearly eleven years ago, protests against the summer shooting of woodcock. Each year since, at the coming of the summer, we have raised our voice in condemnation of the practice, and by "line upon line and precept upon precept" have endeavored to instill into the minds of the public the great importance of protecting our game birds until they were full grown and full fledged. The summer shooting of woodcock is admitted by nearly all who indulge in the practice to be a murderous and destructive business. Not only are the broods exterminated, but in many instances the old birds share the fate of the young; and, unless by chance, the breeding grounds are barren the succeeding year. This is especially the case where the breeding grounds are one side from the regular line of flight, and we have known many such places that remained desolate for years.

There is another very important point in this connection that we do not remember to have seen discussed. Every close observer of the habits of the woodcock is acquainted with their different notes, and has heard the signal with which the occupant of some choice bit of feeding ground calls from the sky the companion whom he hears approaching. We have often, for hours at a time, lingered on the borders of some favorite flight ground, after it had become too dark to shoot, listening to the music of their rustling wings, and have often heard the call of some bird in the covert to all appearances cause the quick-beating pinions to cease their flight and settle near the place. Now who shall say that in this flight from their breeding grounds in the north they do not pass by resorts that were once famous, simply because there is no one at home to let them know that the locality is desirable and to bid them welcome. The point we think worthy of consideration. We believe that with the abolition of summer shooting the fall flight would gradually increase and that in a few years in a large proportion of our once famous "fall coverts" the querulous whistle of gentle *Philohela* would be something more than a tradition.

In some portions of the country woodcock may be legally killed now, although more than one-half of the States that legislate upon the subject have fixed the date at least a month later, and one-half of these put off the evil day still longer. We shall preach no homily upon the enormity of the offense of him who breaks the laws, nor read a lecture to the individual who chooses to broil his brains in the scorching heats of midsummer in the lawful pursuit of so-called sport, nor do we propose to repeat the arguments upon the subject which are familiar to all, but we earnestly appeal to all lovers of woodland sports to heartily join with us in our efforts to rescue from his impending fate this beautiful sprite of "wooded copse and bosky dell." Not alone in behalf of the present generation do we urge the protection and preservation of this royal bird. We plead in behalf of the sportsmen of the future, those who are to come after us, that through the rapacity of those who have charge of their patrimony, they be not cheated out of its enjoyment.

THE EARTH AND THE SUN.—Some of the savants are trying to prove that the earth is older than the sun. We do not care whether it is or not, but we are prepared to show that the joke about the man who shot New Jersey musquitoes for woodcock is much more ancient than our esteemed contemporary the *Sun*, in whose editorial columns it appeared the other day.

NOT THE RANGELEYS.—The name Rangeley Lakes is a mis-nomer for the Androscoggin Lakes. Rangeley is the smaller and upper one of the four great lakes composing the Androscoggin chain, the headwaters of the Androscoggin River.

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

V.

AT the next gathering in Lisha's shop, Antoine was present, and when the old cobbler became aware of him, he gave him a hearty welcome, for though he was always cracking rough jokes upon the Frenchman, he had a real liking for him for his good nature and the kindness he had shown at the time of the memorable bear fight.

"Hello, Ann Twine! Buzzhoo musheer! Cummassy vau! How dy do? Glad t' see ye agin. Oh! you've missed it 't ye hain't ben here t' aour meetin's. Sech stories as the boys has tole, an' Solon Briggs has tole us lots o' things 't we didn't know—nor he nuther."

"Wal naow, onc' Lasha," asked Antoine in a low voice, as he edged onto the corner of the shoe bench, "W'at kan o' langwizh dat wus, M'sieu Brigg he spik it, hein? 'F dat wus Anglish ah can't nevah larn 'em. He broke ma jaw off. Guess he Sous Merican, don't it?"

"Nev' mind, Ann Twine, you c'n onderstand it jes' 's well 's any on us—'n jes' 's well 's he ken, I guess. It don't hurt us none, 'n' it does him lots o' good to let off them 'ere booktionary words. Wal, Ann Twine, it's your turn naow. You got to tell a story or sing a song. Le's hev Pappy no, come. 'Pappee no sa bum pay-raow,'" Lisha sang with a roaring voice the first line of that once popular Canadian revolutionary song. "Tune 'er up!"

"Ba Gosh, onc' Lasha," Antoine said with a sorrowful voice and face, "Ah can' sing, nor tell storec, ah feel so bad!"

"What's the motter, man? Ye inyuns froze, er terbacker gin aout?"

"No sah, onc' Lasha, ah got plenty onion, plenty tabac, plenty, plenty. But ah have sush bad dream las' nat! Oh, ah feel so sorry, me!"

"Tell it, Ann Twine, tell it," Lisha shouted, and all the others joined in the request or demand.

"Ah don' lak tole it, mek you all feel so so bad jes like me, ah fred. Wal, don' you cry. Las' nat w'en ah go bed ah free-git pray. W'en ah git on bed ah tink ov it. Den fus' ting ah say ah shet ma heye, den ah'll beegin. As' de bon Dieu mek me mo' better as ah was—ef he can—an tek care hole hwoman an' all the chillens, 'n' mek it heat not quat so much meat, an more patac* and zhonnerkek dat was cheap. Den ah go sleep. Bambye ah dream ah go to l'enfer, what you call it, hell?"

"Guess 't was 'baout mornin' when you dremp that dream, Ann Twine. Mornin' dreams comes true, they say," Lisha put in.

"W'en ah got dah," continued Antoine, only noticing the interruption by a shrug and a wave of the hand, "de Dev' he come as' me what so good man ah be come dah faw? Ah say ah honly come faw fun, see what goin's on, me. Den he say, 'Se' dawn, se' dawn, M'sieu Bissette, mek it you-se'f to home.' So ah'll sit in ver' warm place an' look all 'raoun'. Bambye one hole man come, he don't got any clo's on it, honly jes shoe mek it tool ond' hees arm. Dev' he say, 'What you want it?' Hold man say, 'Dey a'nt have it me on tudder place, so ah'll come hecar, see 'f ah can git it jawb mek it you some boot.' Dev' he stick it aout bose hees foots, one of it lak man's, one of it lak caow's, den he say, 'You can mezzhy only but one of it for mek bose boot; tek it you choose.' Hole man he say, 'Guess ah tek it de bes' foot,' so he mezzhy de man foot an' go work rat off. Pooty soon rat off, bambye, he have it de boot all do, an' Dev' he try it on, an', by Gosh, de boot fit de caow foot bes', an' he won't go on tudder on 't all, no sah! Den Dev' he mad, an' keek dat poo' hole man aou' door in col'; an' ah feel so sorree for it ah run rat back here an' git it some clo's, an' fus' one ah git hole of 'it was onc' Lasha clo's, an' bah Gosh! you b'lieve it me, dat clo's fit dat hole man jes' if dey been mek it for him, yes sah!"

The laugh which the relation of this dream aroused was made louder by Lisha's roaring "haw, haw, ho," at the end of which he said, glowering at the narrator through his spectacles, "You dremp that wide awake in the daytime, Ann Twine. You ben studyin' on it up ever sin' you was here?"

"No sah, onc' Lasha, ah dream dat in a mawnin'; an' he come true, you say? Wha' you s'pose dat hole man go? Dey won't have it in de good place, dey won't have it in de bad place—wha' you s'pose he goin' go, hein?"

"Guess he'll hafter go t' the 'Hio," Lisha answered, with a laugh that ended in a sigh; "to the 'Hio, where his on'y chick an' child is. Canucks," he continued, "don't never die, 's fur's heard on, 'ceptin' the one 'at I spoke on. When they git old 'nough to die they go to Colchester Pint. Forty, fifty years t'om naow you'll go there, Ann Twine."

"Wal, da's pooty good place to feesh, don't it? Ah rudder go dah as come dead."

"Fish! Yes; fish 'n' inyuns 'n' terbacker 's baout all a Canuck keers for. Ann Twine, you're the furderest Canuck f'om where ye c'n ketch bull-paouts an' eels 't I ever see. Give 'em them an' inyuns an' terbacker, an' an ole hoss, 'n' a wuthless dog, 'n' they're happy."

"You call it ma dog don't good for somet'ing, onc' Lasha? You tole him dat he bit you, den he show he good. He fus' rate dog, sah. He lay in haouse all a time honly w'en he barkin' at folks go 'long on road, 'n' he jes' fat as burrer."

"Good qualities, all on 'em," said Lisha, "p'tic'ly in a Canuck dog, bein' as fat 's butter."

"Those 'ere French," Solon Briggs remarked to Pelatiah, who sat beside him, "is a joc-vial an' a fry-volous race."

"Yus," said Pelatiah, sadly regarding the palms of his mittens, much soiled with handling cord wood since sledding had come, "I s'pose they be pooty smart to run."

Solon, disgusted with his unappreciative listener, raised his voice and addressed the Frenchman. "Antwine, didn't your antsisters come from France?"

"No, M'sieu Brigg, ma aunt seesters an' brudder too, all bawn in Canada. Ma mudder one of it, seester to ma aunt, prob'ly."

"You misconstrowed my inquirement, Antwine," said Solon. "I meant to ast you, wa'nt their prosperity 'at was borned before 'em natyves of of France—reg'lar polly voo Franceys, so to speak?"

"Ah do' know—yas, ah guess so, ah guess yes." Antoine replied at random, having no idea of Solon's meaning.

"Shah! Fur's any conjoogle satisfactualness is consarned, if a man hain't a lingoist he might 's well talk to a sawmill as one o' these furrin Canucks," said Solon, and added, "I b'lieve I'll take my depart an' go hum."

"Ah do' know 'f ah got it rat, zhontemans," said Antoine, as the wooden latch clattered behind the departing wise man, "but ah t'ink wat you call Solum in Anglish was dam hole foolish, ain't it?" There was not a dissenting voice, but Lisha said apologetically, "Oh, wal, Solon means well."

"I'll be darned if I know what he does mean," Sam Lovel said.

"Wal," said Lisha, "I s'pose he 's a well-read man, an'—"

"Dum the wellred men!" Sam broke in, "I wish 't they was all sick 'n' dead, consarn 'em! See haow they'se cuttin' up aout West 'n' in Floridy!"

"Oh, wall," Lisha continued, "we're well red o' him an' them, so le's don't bother."

"Ef I was a Ninjun as I be a white man," cried Pelatiah, rising and smacking his mittens together, "while 't there was a pale face on the face of the U-nited States of Amerikey, I wouldn't never lay daown my bow-arrers, my tommyhock an' my wampum; never, no, never!"

"Guess ye'd nev to lay daown yer wampum 'f I mended yer boots, Peltier," said Lisha, and Sam Lovel advised the budding orator to "save that 'ere fur the spellin' school ex'cises next week."

There was not much further discourse, for Lisha was yawning and his guests took the hint, as broad as his jaws could compass, and went their ways homeward, Antoine singing "Papineau" at the top of his sonorous voice, and all joining in the ringing refrain, "Hurrah, pour Papineau!" till the owls on the further steep of Hog's Back were frightened from their propriety.

*Canuck for potatoes.

Natural History.

"BIRDS IN THEIR HAUNTS."

WE are promised about the end of this month a new book on birds, from the pen of the Rev. J. H. Langille. It is to consist of brief descriptions and full life histories of all the species commonly found east of the Mississippi River, and will give special attention to the songs and nesting habits. The work will contain about 570 pages and will be illustrated by 25 cuts.

The following sketch of the Cooper's and sharp-shinned hawks are from advance sheets of the book:

COOPER'S HAWK.

In the top of a tall beech tree, I discover a hawk's nest, and while I am querying whether it be new or old, the female of Cooper's hawk (*Accipiter cooperi*) alights on a limb near the nest, and presently drops into it. At the same time I see a friend passing along the winter road near by, carrying a fine rifle. He is a good marksman, so I beckon him to my assistance. As I strike on the trunk of the tree the bird leaves her nest, and my friend takes her on the wing. Down she comes, so gradually that she almost appears as if alighting, and skimming along the ground for some distance, finally drops, squealing loudly enough to alarm the whole feathered tribe in the neighborhood. As I approach her, she defends herself with the heroism of a true hawk. The bullet has passed through her thigh, shattering the bone thoroughly, and the two outer pinions of one wing are cut away. But why should this simple shattering of the thigh bring down so strong a bird so readily? The explanation is to be found in the peculiar anatomy of the bird. In 1761, Peter Camper, a distinguished Dutch anatomist, discovered that the cavities in the bones of birds, which Gabbe had already observed to contain no marrow, were in direct communication with the lungs, and so participated in respiration. In 1774, John Hunter, the great English comparative anatomist, verified the same in his marvelous researches into the anatomy of birds. Extending their investigations in the most able manner throughout the entire class of birds, they discovered that "the air-cells and lungs can be inflated from the bones, and Hunter injected the medullary cavities of the bones from the trachea. If the femur"—the thigh bone—"into which the air is admitted be broken, the bird is unable to raise itself in flight. If the trachea be tied and an opening be made into the *humerus*"—the upper wing-bone—"the bird will respire by that opening for a short period, and may be killed by inhaling noxious gases through it. If an air-bone of a living bird, similarly perforated, be held in water, bubbles will rise from it, and a motion of the contained air will be exhibited, synchronous with the motions of inspiration and expiration.

My specimen of Cooper's hawk is one of the largest, some 20 inches long. She is sometimes scarcely more than 18 inches long, while the male is never more than 18, and may not exceed 16 inches in length. This species, which in structure and color is almost precisly like that of the sharp-shinned hawk, being, however, unmistakably larger, makes with it, and it only in this country, a strongly marked genus, the *Accipiter*—the distinctive generic points being: first, that the feathers extend but slightly down the tarsus; second, that the toes are long and very slender, much webbed at the base, and thickly padded; third, that the fourth primary is longest, the "second shorter than the sixth," and the first noticeably short; fourth, the soft and finely blended character of the colors above, in maturity—being a fine ashy-brown, blackish on the head. The under parts of both birds are white, with fine cross streaks of light reddish. They bear about the same relation to each other as that of the hairy to the downy woodpecker. Cooper's hawk is especially a bird of the United States, most common in the Northern States, and extending but slightly into the British Provinces. The sharp-shinned hawk is sometimes found here in winter, but Cooper's hawk goes further south. Early in May is the time for the nidification of the latter in this locality. The nest, in the crotch of a small tree, or where several limbs join the trunk, always very high, is built of sticks and lined with dry grass, or strips of bark, sometimes containing feathers, the depression being but slight. The eggs, three or four, sometimes five, about 1.90x1.50, are white, greenish or grayish tinged, often clear, sometimes slightly blotched with dark drab or brown. Mr. Samuels mentions a pair robbed of their eggs four times in the same season. "They built different nests in the same grove, and laid in the four litters, four, five, and three eggs, respectively. The eggs of the last litter were very small, but little larger than those of the sharp-shinned hawk."

The ordinary flight of this bird is rapid and straightforward, the regular strokes of the wings being frequently relieved by sailing. In the mating season, when it is very noisy, having a note which sounds like *chee-e-e ah*, I have seen it, high in air, above the tops of the tallest trees, shooting toward one of its kind whose voice it heard in the distance, with half-closed and perfectly motionless wings, and with a rocket-like speed and a gracefulness which no language could describe. In pursuit of its prey, which may consist of small quadrupeds, the smaller ducks and waders, grouse, and the larger kinds of the common land birds, it moves with great spirit and adroitness, and seldom misses its quarry. So well known is it in the poultry yard that it is called the "chicken hawk." When reared from the nest it becomes so thoroughly domesticated as to need no confinement.

THE SHARP-SHINNED HAWK.

The sharp-shinned-hawk (*Accipiter fuscus*), in every way so similar to Cooper's hawk, is some twelve inches long; brown or slate-colored above, with a few white spots on the back of the head and on the scapulars; tail also brown or ashy, but considerably lighter, with fine dark bands across it, sometimes tipped with whitish; the white under parts closely and narrowly barred with reddish; throat, narrowly streaked lengthwise with brown. Its nest is similarly placed to that of the former species, only not so high up in the tree, but is occasionally placed on a rock. The eggs, some four, are about 1.40x1.20, roundish, clear white, or perhaps slightly tinged with blue or green, heavily and distinctly marked—patched—with brown.

This hawk reaches Western New York the latter part of April, and its eggs are laid early in May. It is readily distinguished by its short, broad wings, and rather nervous and irregular flight; but it moves rapidly, and sometimes with great impetuosity, so that it has been known to pass through several glass partitions of a green house. Seizing its prey on the wing, in the manner of a true hawk, it dashes after it with the utmost directness, moving high or low, to the right or left, as if by some continuous attraction. With an unerring stroke, it wounds fatally in the very act of capture, and then bears its prey to a tree, to be devoured at leisure. In addition to the small birds thus taken on the wing, it may pounce on one larger and heavier than itself, or it may swoop down upon the small quadrupeds, or, after the manner of the smaller hawks in general, make its repast even on insects. As with birds of prey in general, the surest way of escaping its clutches is by soaring; the thickets, into which the smaller birds generally dive when pursued, affording but little protection to its penetrating flight. Its note, which is but seldom heard, is sharp and shrill. Ranging over all North America, it may be found in New York and Massachusetts during mild winters.

THE USE OF FIELD GLASSES.

REFERRING to the use of field glasses for inspecting and determining the various species of our feathered songsters, let me add, that during nearly three years' study of birds, the field glass has given me more insight into their ways and habits than the close examination of inanimate specimens.

The yellow-breasted chat, one of the birds most solicitous of concealment and difficult of apprehension when pursued, may be brought close to and examined satisfactorily with a pair of glasses, for as soon as this eccentric individual finds that it is not sought, it leaves cover, and may then be seen scratching about in the leaves and brush in company with brown and wood thrushes, fox-sparrows and chewincks, the latter, although not being what may be termed shy birds, still prefer their thickets and groves to the near presence of man. Some of the warblers, Blackburnian, blue yellowback, Nashville and a few others, seek their food among the higher terminal blossoms and twigs of our large shade trees, but the majority may be found lower down, in company with the vireos, thrushes and sparrows. A tub, shallow trough, or better, a small wooden tank, may be used to advantage, as the birds can then be encouraged to bathe and at the same time be brought closer for inspection. In a tank four feet by four and one foot deep, with a platform in middle; during the warm days of July and August, on an average sixty-five birds of different kinds bathed and plumed within one and one half hours. Birds were the wood, brown and tawny thrushes, catbirds, chipping and song sparrows, blackpoll, [??—ED.] summer, yellowrump, black-throated green and Nashville warblers. Baltimore and garden orioles, kingbird, great crested flycatcher, phœbe bird, American gold and pine finches [??—ED.] (the latter not often), red-eyed, warbling and yellow-throated vireos; and robins, catbirds and red-eyed vireos most numerous. The "parasite" (*P. domesticus*) also frequents the tank and much annoys the smaller birds, but as I have a smoothbore Flobert, with a dust shot cartridge, near by (especially for these pests), the rascals rarely escape to tell a tale. This tank is not more than twenty-five feet from the house porch, and if removed further away the number of visitants would undoubtedly enlarge.

Much might be said about the manner of bathing of the birds; how the red-eyed vireo plunges unhesitatingly into deep water, and the others step daintily down the incline, first dipping the bill, presumably to drink, but seemingly to test the temperature of the water. Any one who has seen their peculiar fuzzy appearance, as they stand all wet and dripping, shaking themselves and then go off with a chirp of delight to some bush to plume and arrange their dress, cannot but feel satisfaction in knowing that he has but taken his specimens with a field glass. Three of your readers practice this plan, let more try it. BITTERSWEET.

BAY RIDGE, Long Island.

AN ELECTRIC AMPHIBIAN.

BY GEO. T. ATKINS.

[From a letter to the U. S. Fish Commissioner.]

I GOT in to-day quite a curiosity. An old fisherman on Elm Fork of Trinity caught what seemed to be an eel. He caught hold of it to take it off his hook, and it gave him an electric discharge, powerful enough to affect the muscles of side, shoulder and arm, and cramp the hand sufficient to make him halloo for a companion to come aid him in getting loose.

I have the eel living in my store; it is a queer looking fish, has two feet or legs where the pectoral fins should be, each foot has four fingers to it, about one-eight to three-sixteenths of an inch in length. The mouth is broad, an eel's mouth is pointed. This fellow's head shapes down, more like the catfish; mouth rounder and broader than the ordinary eel. He has the regular opening for gills behind the head, but the lungs sit out on each side, and range off upward from the head a perfect set of brachiæted fern leaves—blood red to the center and pale dirty-tinged at the tips. He is about fifteen to sixteen inches long, one inch in diameter, and about three inches from tip of tail has a natural cut in it on top separating it from the body.

I do not know what it is, nor whether it will live or not.

If it dies I shall put it in alcohol. Did you ever hear of the like?

On the ground uses legs for motion and turning, otherwise appears to act in every way as an eel does, not offering to bite on being handled.

DALLAS, TEX., June 11, 1884.

[May not this be one of the *Sirenidæ*?]

ST. NICHOLAS AGASSIZ ASSOCIATION.—This most excellent little handbook of the *St. Nicholas* Agassiz Association, which we have just received, deserves something more than a mere mention. The conception of the Agassiz Association originated with Mr. H. H. Ballard, the author of this Handbook, and was, as he says, "the outgrowth of a life-long love for nature, and a belief that education is incomplete unless it include some practical knowledge of the common objects that surround us." As its name implies, the Agassiz Association is a natural history society, and one which is intended to be broad enough to include all the youth of this country. The Association is made up of local natural history societies, chiefly organized in schools, by some instructor, or by some pupil who has an especial taste for some department of this study. The purpose of the Association is to foster in the young an interest in, and a love for, nature. A number of more advanced students in various branches of science, have offered their services in behalf of the Association, and such aid will be of the greatest assistance to beginners. The instruction and communication between the members of the different chapters all over the country, is carried on by correspondence, and thus each student may be brought into close connection with some one who is more advanced than he is, in his particular branch. We regard the originator of this plan for a wider diffusion of a knowledge of nature as entitled to the greatest credit for having inaugurated so good a work. By instilling into the heart of the child a love for nature, and a study of those of its forms which are constantly brought before us, inexpressible possibilities for added happiness are brought into the life of that child. And among all the young students, who are already members of this Association, and who will belong to it, there cannot fail to be a number who will, sooner or later, add something to the sum of human knowledge. The Association was started with the aid of the *St. Nicholas* magazine, of which the monthly reports have long been a department.

UNDER WATER.—One afternoon recently, while walking along a stream a short distance from this place, I noticed a small slender bird with a disabled wing running a short distance ahead, which, upon a closer view, I found to be of the wader kind; a little bird well-known about here as "knee-deep," probably so named partly on account of its habits and partly on account of the fancied resemblance of its note to those words. It will be readily recognized from its tilting motions when running or standing. Being somewhat interested and curious to note his movements under such conditions, and keeping at such a distance as not to cause any violent demonstrations of alarm on his part, I found that he made no attempt whatever to hide, although in the midst of abundant opportunities to do so, but after twisting his way through the tall grass bordering the stream for some time, he quietly dropped into the water, and to my surprise, went quite to the bottom. This occurred at a point where the stream was ten or twelve feet wide and as many inches deep, the water being perfectly clear, so that the bird was in plain sight as he deliberately struck out for the opposite bank under nearly or quite a foot of water. Watching him closely as he propelled himself rapidly across, keeping close to the bottom, much after the manner of a frog, I soon saw him "bob up serenely" near the other side, apparently without a wet feather. Then by swimming on the surface like the duck or other web-footed birds, he reached the further shore and resumed his former tactics on land. The under water part of the performance, to say nothing of the surface swimming, is something entirely new to me with reference to this bird, although its regular appearance and ordinary movements and habits have been a familiar sight to me for more than twenty years. I would like very much to know whether or not this was an exceptional case.—W. D. Z. (Lancaster, Pa.). [The bird is the spotted sandpiper (*Tringoides macularius*). It is not unusual for it when wounded to dive and swim some distance under water.]

NATURE'S HEALING ART.—Several years ago, about the first of September, our party was in camp on Follansbee Junior Lake in the Adirondacks. One morning a doe, driven by the hounds, plunged into the water and swam into the middle of the lake. Henry, the guide, jumped into his boat and killing the doe, brought her to camp, and when we arrived the deer was dressed. The doe had but three legs. One of the hindlegs had been so completely severed from the rest, just where the thigh begins to enlarge into the quarter, that the detached part hung by a mere thread of skin. The lower part was in a bad state of mortification, but the living part was nearly healed up and the flesh was to all appearance in as good condition as any. The general appearance of the deer was also good and there was nothing to indicate a diseased condition. The deer in all probability had been shot at by some night-hunter, as the wound looked like one made with buck shot. Does it not seem incredible that a deer wounded so badly could stop the bleeding and apparently so doctor the wound? Can any of the readers of the FOREST AND STREAM explain it?—AMPERSAND. [We have occasionally seen deer, elk and antelope that had recovered from severe and disabling wounds, but never anything that quite parallels the case mentioned by our correspondent. Several times we have seen antelope killed whose feet had been shot off not far above the hoof, and in all such cases the animal had made use of the legs and a hard horny pad of skin had formed on that portion of the leg which touched the ground in walking.]

ROSE-BREASTED GROSBEAKS ABUNDANT.—There seems to have been a flight of rose-breasted grosbeaks at this place during the past week. On Monday morning I collected a beautiful male of this species, and the next day secured a male and female that betrayed their presence to me by the powerful rich voice of the male. Thursday morning I heard another of these elegant songsters, and looking carefully up saw him in the top of a large chestnut tree throwing out his beautiful music on the cool still morning air. In a few moments he flew off and I heard his voice in a thick swamp a short distance off. As I turned to leave another male struck up his beautiful song until it seemed as if the woods was alive with the music. I have not noted any of these birds in this locality before this season.—J. C. CAHOON (Taunton, Mass., June 7).

YOUNG GORILLA IN CAPTIVITY.—The first living specimen of the gorilla ever brought to France was described by Prof. A. Milne-Edwards in a note to the Paris Academy of Science. It has since unfortunately died. The following abstract of the description is published in *Nature:* "It had been imported from the Gaboon, and it was the first living specimen of this great anthropomorphic ape which had been brought to France. Its study would have presented many points of interest, not alone from the natural history point of view, but also from the opportunity it would have afforded of studying the developments of its intellectual faculties. This young specimen is about three years of age; he had already his full complement of milk teeth, and the long and sharp canines were decidedly longer than the molars. In disposition he appeared to be very different from either the orang-outang or chimpanzee. While these in a state of captivity are mostly gentle and sociable, this young gorilla, on the other hand, was savage, morose and brutal; he never gave his keeper the least mark of affection; he never allowed himself to be touched without evidencing the greatest aversion, and for the most part he returned caresses by snappings. He never took the least part in the games of the other apes, and he most reluctantly tolerated having them near him. He was but little active, and most generally kept himself crouched up in a corner of the cage, or sitting on a branch with his back up against the wall, and scarcely ever moved but to look about for something to eat. He used his hands with much readiness, and they were extremely well developed. His lips were less mobile than in the chimpanzee, especially the lower lip, which was never pouted out when drinking into a spoonshaped form. His eyes were extremely mobile, and were crowned with immense superciliary ridges; his nose was flat, with excessively large nostrils, giving him a quite peculiar physiognomy."

ORIOLES IN MASSACHUSETTS.—Boston, June 9.—*Editor Forest and Stream:* My attention has been called to an article in your paper of May 15, headed "Decrease of Song Birds." I think if "Reignolds" will take the trouble to read my advertisement he will find that it called for live birds, and not for specimens for stuffing. The birds were wanted for an aviary, and the few that would have been used could make no difference. There seems to be the impression that if a man is by profession a taxidermist he must be a contemptible fellow, whose only ambition is to destroy every bird and bird's nest that he can find. Now, I can assure you that this is not so in my case; nor do I think that any respectable taxidermist would kill birds for millinery purposes, nor take bird eggs to sell to boys at five or six cents each. I have been in my present store about fifteen years, and during that time have taken one bird's nest, viz., humming bird, and I think that I can safely say I have not killed fifty birds per year. I have always done what I could to protect game birds and have imported from other States, and turned out in this several hundred quail within the last ten years. I do not think "Reignolds" can be much of an ornithologist or he would be able to distinguish the South American from our native oriole. Had the writer, who laments the absence of the oriole, waited a few days, he would have been better posted and found that Lord Baltimore is in fuller force than usual this year.—C. I. GOODALE.

BIRDS AND TELEGRAPH WIRES.—Mr. Adam Dietz captured a fine eagle yesterday morning. It had strayed into town, and, flying too low, became entangled in the net work of telegraph wires at the corner of Lee and Charles streets. After a sharp struggle it freed itself from the wires, but fell to the pavement. Mr. Dietz ran to seize it, and it eluded him and ran toward Barre street. The small boys of the neighborhood now joined in and ran the eagle down near Barre street. Mr. Dietz caught its wings just as it was attempting to rise, and carried it home. After deliberation the amateur ornithologists of the vicinity announced the prize to be a bald eagle. It appears to be young but well grown. Its wings, when outstretched, measure about six feet from tip to tip. Though languishing in the back yard and tied down by one leg, its spirit is unbroken, and a friendly tender of some food in various dishes last night was rewarded by a smash-up of the china.—*Baltimore Sun, June 23.*

RANGE OF THE BEAVER.—New York, June 26, 1884.—*Editor Forest and Stream:* "Jay" wants some one to corroborate his having seen beaver sign as far south as the Colorado River, in Texas. I have seen beaver and beaver sign at least two or three hundred miles further south than that, and if my memory is not at fault, there was a beaver dam in the Los Moras Creek a few miles below Fort Clark, Texas, in 1869. The blue topknot quail he speaks of are very common along the Devil's River, the Pecos and many other streams in Western Texas; I am not sure that they are identical with the California quail. If "Jay" had lied about the cowboys, as most people do who visit Texas, I would not have helped him out on the beaver business, but it is as he says, Texas people will compare very favorably with those of any other section or country, and a cowboy's friendship is one worth having, because you are sure he will "stay with you."—CIBOLO.

TAME SQUIRRELS.—Mr. F. H. Furness, of Waterloo, N. Y., has made friends with the squirrels at "Fern Lodge," where his summers are spent. A visitor there writes in the *Phrenological Journal:* "But I leave the inventory to say that even the wild birds and squirrels have become tame by constant companionship with the lord of this sylvan manor. I saw him call squirrels by name from out the tall trees and feed them upon his lap. The writer so far succeeded with one of the little athletes as to give him a nut from his hand, which he partially shucked upon his knee, and then deposited his treasure sixty feet high in a tall pine, and returning, chattered his gratitude at a cautious distance."

IN THE ADIRONDACKS.—Keene Valley, Essex County, June 24.—I wrote you hurriedly three weeks since, after returning to New York. This short time has greatly transformed everything here, and at this season of the year there is not a place in the State more picturesque than this very valley. It is but six miles from here to the Ausable Ponds, so well known by camping parties, and the very double of the prettiest lakes of Switzerland. Keene Valley has its complement of efficient guides, and this is a central point to start from for almost any trip. The hotels here are good, and are kept by Beede, Blinn and Egglesfield. In the height of the season the village presents a bright and life-like picture. A number of New York's prominent landscape artists have their summer residences here, among their number I mention A. H. Wyant, John A. Parker, Shurtleffe Robbins and others.—W. L. HOWARD.

Game Bag and Gun.

THE WELCOME HOME.

OF the sportsman's welcome home "Piseco" writes pleasantly, as follows:

Not far from where I have in my lifetime spent a very pleasant year there is a cosy country home that has contributed much to my enjoyment of the period, for there I received always a hearty welcome, and after a fatiguing tramp for quail was sure of a compliment if I had been successful, apparent trust and belief in my excuses if non-successful, and in either case a cup of Old Government Java or soul-stirring apple toddy.

My welcome began a long distance from the house; for rushing with clamor, soon turning from angry to friendly tone, came the dogs, affectionate to an extent that I failed to appreciate, when arrayed in aught but my shooting attire, for the sacred soil is very muddy soil, and dogs' forepaws will pick up and transfer some of it. No common dogs were these; each had its own peculiarity. There was Woodcock, a graceful blue belton. Such a dog as he had been! but now nervous and gun-shy, but a firm barker; and Meadow Lark, a young Irish setter, who no doubt would some day prove a fine bird dog, but now afflicted with a lame leg, and either deafness, a strong will of his own, or want of knowledge of the English language, for he disdained to mind a word; and there was Lucius, who was once "such a beautiful puppy," but who now, after sundry attacks of epilepsy, stood out a monument to the truth of the saying that the most beautiful children grow into the least handsome adults; and Bobtail, whom I think nature intended for a bull-terrier but made some mistake in the plans, and art brought to bear had, by close amputation of ears and tail, produced a rare specimen, but withal a dog who did not depend for reputation upon either the past or future, what he had been and would be he was—a savage-looking creature, whose appearance and bark proved good defense from wandering tramps. Finally came Partridge, a noble blooded English setter, staunch, fleet and faithful, but, alas, destitute of a peculiarity.

A little closer to the house welcome was found in the tameness of the bronze turkeys, with tails so stiffly outspread that one wondered if they ever got limber; fowls of various choice breeds, domestic and muscovy ducks, and splendid creatures, a cross between them; guinea hens and a lonesome rooster, who, because he alone avoided instead of approached a new arrival, was reported as crazy.

Then near the porch, on which, with a smile of welcome, stood the Colonel, some of the younger members of the family came forth to greet. And then the porch, and the Colonel, and the refreshments already mentioned, and a good cigar.

The Colonel makes no professions or claims to be an adept with a fowling piece, but now and then it becomes very evident that he does consider himself well qualified to judge of the skill of others. A case in point. He was one day witness to a very bad shot upon my part, one of those "unaccountable misses." He said little but probably thought much.

As I returned from an unsuccessful tramp for quail, a couple of his big muscovy ducks flew in from the river, circled over our heads, and alighted not thirty feet from the porch, where we stood and admired them. They were half as big as turkeys and very handsome birds.

"Colonel," I remarked, "you had better clip those fellows' wings, or some day when out on the river for ducks I may mistake them for wild ones and let go at them as they fly over."

Fancy my feelings at his answer: "Let go now if you want to, you can't hit them."

PISECO.

THE OLD TAMARACK SWAMP.

OF all the game resorts it has been my privilege to tramp over with dog and gun, I know of none that has in time past afforded such an amount and variety of sport as has the old tamarack swamp and its surroundings, situated in North Bloomfield, O.

Indications are that the swamp, which contains some 2,000 or 2,500 acres, was formed largely, if not wholly, by the beavers, as their works are visible even at this late day.

It was the home of large game—bear, deer and wolves, for many years after they had been killed and driven from most of the surrounding country, owing, no doubt, to the shelter afforded them by the dense growth of alder and huckleberry brush covering the entire tract, and the exceedingly marshy condition of the ground. As a pigeon roost, it was second to none within hundreds of miles, and as all that section of country was well stocked with oak and beech timber, the birds used to visit us frequently or as often as there was a plentiful supply of mast.

Well do I remember in my early years the heavy clouds of pigeons. Many of these flights were miles square in extent. Nightly, for weeks and sometimes months at a time, they used to congregate in and about this old swamp to roost, until every bush was loaded to its utmost capacity, and probably there were as many more in the surrounding timber. People came in from the country for miles around to hunt them, and many were the bags—and by this I mean two-bushel grain bags—that were taken out almost nightly, so long as they remained, amounting in the aggregate to a figure that had better not be mentioned, for to those who have never visited a large roost it might appear improbable.

The sight afforded one from the top of a tall tamarack in early morning, just before or about the time they were leaving their roost, was well worth going a hundred miles to see, and it must be seen in order to be anything like fully realized. One would naturally think the supply could never become exhausted; but how their numbers have been reduced during the past twenty-five years is only too well known. This continual netting for twelve months in every year, together with rather a free use of the shotgun, has not been without its result, and unless there is some protection afforded the pigeons, more than they are now getting the benefit of, I don't think it would require much of a prophet to foretell their future. Why not have a closed season for them of, say, six or eight months in every year, throughout every State and Territory, in addition to the "dead letter" now enacted for them.

During a severe drouth through Northern Ohio some twenty-eight years ago, the glory of the greater portion of this old swamp as a pigeon roost and also as a resort for large game went up in smoke. Deer did not long survive this destruction of their shelter. Wild turkeys, however, in fairly good numbers, for a country so long settled, remained,

and grand was the sport occasionally to be had with them in winter, after the swamp was sufficiently frozen to enable one to follow them in among the wild grass and cat-tails, which soon took the place of the brush, and where they were almost sure to skulk, particularly if the hunter were between them and the timber, and at times they would lie very close. I shall never forget the surprise one old turkey gave me. I think it was the first I ever hunted in this way, and it was before I was altogether acquainted with their habits. The day was windy, and the dry rattling grass of course favorable to a close shot, as my approach could not be heard. I had followed the track some little distance as it crooked about in this nice cover, using the muzzle of my gun to open the grass when necessary, to enable me to see the track, when in separating an unusually thick bunch I actually uncovered the old thing before it got up, which it did without delay, and may be going yet for aught I know to the contrary. I, however, do know that I fired two shots and didn't touch a feather, and that the turkey probably was not twenty feet away when the last shot was fired, and it looked as large as a haycock.

The principal and about the only grain of comfort that came to me that day was a knowledge of the fact that I was out by myself. No one, not even a dog, witnessed my disgust, which, it seemed for a time, would choke me.

Foxes, both red and gray, were quite numerous, also both white and gray rabbits for a number of years after this favorite cover was burned. Ruffed grouse were also to be found in goodly numbers around its borders till within a few years, but with the exception of a few gray rabbits, an occasional red fox, and a few snipe and ducks for a week or so in spring, that section, as a game resort, is in the past.

The land is being drained and farms laid out. The time is not far distant when all that will remain of the old tamerack swamp will be its history.

On what used to be a beautiful little island in the southern portion of the swamp, are three Indian mounds—so called—indicating that it was once the home of a portion of that ancient race, of whom we know so little. E. M. GREEN.

NEW YORK, June, 1884.

TWO-EYED SHOOTING.

Editor Forest and Stream:

Thinking that perhaps it might interest some of those who are agitating the system of two-eyed shooting I send you a few extracts from an old English work on shooting, by John Sherer. He says: "Much has been said on the superior advantages of the use of two eyes over one, in fact some of the advocates of the two-eyed system have spoken very disparingly, and, as we cannot help thinking, with unbecoming severity, of those who support the one-eyed plan, the latter being represented as slow coaches, their practice behind the times, obsolete, etc. But is this the fact? We think not, and if we may be permitted to judge from observation and experience, we should say the one-eyed man is quite as competent to 'fill the bag' as their opponents, simply because we believe each system to have its relative advantages and disadvantages, presuming each party to have guns of similar make and construction, of like setting as to the barrels, and of equal elevation of the rib. But, if guns are badly set, and with insufficient elevation, then it must be readily admitted that the two-eyed man will have a most decided advantage in helping himself to that which the gunmaker has denied him. But with guns constructed and put together on modern improved principles with proper setting, sufficient elevation, and peculiar fitness for the use of one eye, it strikes us that the two-eyed man has not all that superiority over his opponent of which he boasts; for, if the one-eyed man occasionally shoots under a rising bird, the two eyed man must sometimes shoot clean over a bird which is rapidly descending if he shoots in a wild, hilly, and mountainous country. In a flat, level country we are sensible that this latter case would rarely occur, consequently there the two-eyed man would have the advantage.

"Having shot many years over an uneven and mountainous country, where there were as many shots one way as the other, and being in the habit of using sometimes one eye and sometimes both, we must admit having occasionally shot over birds quickly descending when using both eyes, and sometimes having shot under rising birds when only availing ourselves of one eye. Here we allude to snap shots presenting themselves unexpectedly, in the taking of which the most experienced may occasionally be surprised, and reverse the principles on which they generally act. If, therefore, we may be allowed to judge equally from experience and from observation, we should conclude that neither system is perfect, each being liable to occasional failure, and if both parties will dismiss *amour propre*, and be candid, we think they will arrive at the same conclusion. The use of both eyes unquestionably gives extra elevation; in fact, almost indefinitely so, according to the judgment of the sportsman. But is this necessary, and is it always an advantage? We think not, for if a gun be properly put together, we cannot see that this extra elevation is required, except for a small proportion of rising shots at long distances, and we believe that the difficulty presented even by these will be readily overcome by the one-eyed man of experience, who possesses nerve and presence of mind.

"If the two-eyed system be as superior to the one-eyed one as its advocates insist that it is, why require any assistance from the gunmaker in the setting of the barrels? Why have any elevated rib? as it is evident all this is superfluous and unnecessary for the carrying out of the two eyed principle. For, if we judge rightly of it from the statements of its most strenuous advocates, they despise the steady old plan of looking along, or in the direction of the elevated rib in line with the sight, holding their heads above the barrels and taking their own elevation and line of sight, exercising their own judgment on the spur of the occasion, so that in this speculative system much practice and experience are requisite in order to acquire the habit of accuracy and precision. From this we think it may be fairly inferred without illiberality toward the two-eyed men that their system is not infallible; that they sometimes err, and consequently that their practice has not that decided superiority over the one-eyed system which it is presumed to have; as the latter, as far as it goes, is not liable to mistake, and is easily carried out—the precise extent of elevation being already determined and arranged by the gunmaker on unerring principles. The hand will to a very great extent follow and obey the eye.

"We are, therefore, convinced that in snap shots, even at such large birds as blackcocks, when they slip off the high top of a mountain, instantly gliding down below, the two-eyed man would, if he were inexperienced in that sort of shooting, shoot over many more birds than he would ever hit. This result, we think, must strike every one, even if experience were not referred to for its confirmation; but let any one who doubts it test the point by experiment—bring the gun quickly to the shoulder, with both eyes directed to a particular object, and he will find, on immediately closing one eye, that the point of the gun is above the object aimed at. Now, if a similar experiment be tried with one eye, and the gun be brought up quickly to the shoulder, it will be found that the point of the gun will be under the object aimed at, which in snap shots at rapidly descending birds will be an advantage which the one-eyed man will unquestionably have over his opponent." And again in the same work, in reference to the proper charge, he says: "Mr. Greener (the elder), a gentleman of great experience of the gun, says, 'Suppose you begin with two drams, and vary the charge one-eighth of a dram each shot up to three and a half drams, or as may be required, according to the length and bore of the gun, and, for precision, taking three shots for each charge at a sufficient number of sheets of paper, which ever you find strongest, with the least quantity of powder, that is the best charge, as very likely the two additions of powder will shoot equally strong, and yet not stronger, because more of it remains unburnt.'" This is in favor of "Byrne's" theory. The book was published just previously to or soon after the introduction of the B. L. guns. Mr. Greener refers to the M. L. gun. Hoping to see this printed, I remain, J. C. YATES.

MICHIGAN.

IN THE BACK COUNTRY.

HAVING been an invalid for some years, I have not been able to enjoy a tramp in the woods. However, like Goldsmith's old soldier,

> "Who shouldered his gun,
> And showed how fields were won,"

I can recount some experiences of the past.

A few years ago, I had occasion to visit the county of Huron in Ontario, Canada. I took my breechloader, as a good, honest woodsman, at whose home I was to stay, had told me that the "patridgez were mighty plenty." It was in the early part of December, when I left the train at the station about 9 o'clock, P. M. The moon hung like a silver globe in a cloudless heaven; the snow, white and glistening, covered field and forest, and as my friend did not know just what day to expect me, he was not at the station to meet me. I had some three miles to tramp by a narrow, lonely road, that ran for a good distance through a dense swamp; however, the keen, fresh, wintry air, acted as a grand tonic, and what with the glorious moonlight, made one feel just in trim for a tramp. Soon the crisp snow was crunching beneath my feet. Shortly after leaving the station the road entered the swamp, the tall and stately cedars spread out their cumbrous branches over the roadway, casting somber shadows on the virgin snow, but here and there, through the openings in the woods, the moon shining on the snow left pathways of light through aisles of shadow. Not a sound was to be heard save the crunching of the snow beneath my feet, and no sign of life was visible. In spite of the oppressive silence, the glory of the slumbering forest in its snowy covering made the heart beat with delight. After emerging from the woods the road wound through some fields, then struck into a beaver meadow, and just across the meadow on a rising slope I saw what I knew by description given to be the house of my friend. It was a few hundred yards from the meadow—a primitive log dwelling and surrounded by woods. As I neared the house I heard the barking of the watchdog, but fortunately he was within. Stepping to the door I gave a rap, and the good housewife gave me a hearty welcome. The woodsman, with his two daughters, were absent, having gone out to see a neighbor a few miles away, so I sat down by the fire and proceeded to make myself comfortable, while the good woman gave me a minute account of the white calf, the spotted pig and the yellow hen. It was not long before I heard the sound of approaching footsteps and a vigorous stamping, when the door opened and in walked my friend. Spying me as I arose to greet him, he said: "Wall, now, here he be; how hare ye? sit yer down. Mary, Jennie, this be Mr. ———, from N——." That man's grasp of welcome was as hearty as the tones of his voice. Tall and muscular, and honest as the day, he stood one of nature's noblemen. The daughters in due form shook my hand in good pump-handle style, and I at once felt the glow of spirits and the sense of comfort that spring from a hearty welcome.

In merry chat the hours flew by, and the time came for retiring. My good friend informed me that he had just "abuilded this house," but they had not had time to put the "pertitions in yit. Yer mustent mind, however, you sleep in Mary's bed, the fur one; Mary and Jennie can sleep in the next, and the old woman and I'll sleep in the one t'other side the room." You may be sure as a bashful man I was not in a hurry to retire, but all were so polite and easy I felt all the force of the old proverb, "Do in Rome as the Romans do." I took a good survey of the room, and marked the exact locality of my bed, when the old boy pursed up his lips and sent forth a hurricane of wind that blew out the light. "Now," he says, "good night to ye." I remained by the fire with my back to the beds until I was assured by the sounds that Mary and Jenny were safely ensconced in their couch, when, with most cautious tread, I made my way in the darkness to my own retiring place. I reached it without any mishap, and in less time than would seem possible, was safe beneath the blankets. Silence soon reigned supreme; through the cracks in the logs I could see the white moonlight on the snow without. Soon I heard a dull, strange sound like a frog's bass. It was the brave man of the woods snoring. His wife soon joined in musical rivalry; then a thin piping sound arose not far from me, and then another; all rising and falling in the clear frosty air, and as "music hath charms etc.," I was soon lulled to slumber, and probably sent forth sonorous sounds from my own aristocratic bugle.

I had determined to be up with old Sol and have a tramp through the woods in search of the "patridgez." But, alas! when I did awake he was casting his beams through the curtainless windows. I quickly thought of the surroundings of the previous night, and cautiously took a survey of the room. Imagine my consternation when I saw that my friend and his family were all up and dressed. He was seated at the fire with his back to me, smoking away at his pipe. The good wife, with a large spoon, was stirring the contents of an iron pot; the two maidens were spreading the table. Cæsar Augustus! Here was a fix. Not knowing what to do, I gave a barely audible sneeze, but with no effect on the company; then another louder, then another more emphatic. No go. Then I entered upon a violent fit of coughing, though, by the way, my lungs were as sound as a bell. This at last attracted the old man's attention, when he turned and said, "Yer got a purty bad cold, mister, beant yer?" I gestured wildly to him. He took the hint and gave me a sly wink and a smile, and said, "Mary, go and get a pail of fresh water from the spring, the gentleman's thirsty. Jinny, go and see if yes ken find him a fresh egg." When the girls disappeared he whispered in the old lady's ear, and she beat a retreat. Now was the time for action. Out of bed in a jiffy and into my unmentionables. But, alas! they were drawn on hind before, and the sound of approaching footsteps warned me there was no time for a reversal of the garment; so, hitching them up behind as well as I could, and donning my vest and the coat, which had comfortably long tails, I joined the party at the table. As soon as possible after breakfast I went to the barn to look at the white calf, the spotted pig and the yellow hen, and up in the hay those pants swung around to the wind. Returning to the house I joined my honest friend, who had a queer twinkle in his eye.

We then made for the beaver meadow. He went in among the thickets of cranberry and other bushes that skirted its edge, while I kept out on the sloping ground among the beech, birch and oak trees. Here and there we passed a dense clump of hemlock. Having no dog, my friend undertook to search the dense thickets, while I kept in the open woods. Soon I heard him shout, "Look out!" then the rush of wings, and to my left, just above a clump of low trees, went a cock grouse at a rattling pace. However, I was on alert; the gun went instinctively to the shoulder, the clear, frosty air rang with the sharp report, the blue smoke curled among the trees, and a cloud of feathers floated in the air. Soon soft and warm it lay in the game bag; and so shot after shot rang through the woods, some missing the swift birds, but the most of them sent the feathers floating, and soon filled out the game bag.

Passing through a clump of beeches I heard a grouse take flight from the treetops; looking up I saw another poised erect upon the top of a beech, and as it was moving for flight I fired and down it came and lay almost buried in the fine snow. It was placed in the bag. About half an hour after, as we were trudging along side by side, I felt a movement in the bag, and away went this grouse out of the bag, gathering speed as it flew through the trees, but my gun went to the shoulder, and before it got out of range I brought it down. Hurrah! That was the best shot made that day. The man of the woods stood open-mouthed with wonder and said, "Wall now, that were a shot." Eight grouse fell to the gun that day.

Those were grand old times. I bade farewell that evening to my kind friend and his family. He walked with me to the station. As I left the house the old lady waved the soup ladle, the bashful "darters" flattened their noses against the window panes, the white calf bellowed and waved its tail, the spotted pig grunted, and the yellow hen ran off and laid an egg, so anxious were they all to do something to make the farewell affecting. OLD RAMROD.

CANADA.

MORE SMOKE MEMORIES.

OLD SQUIRE N. was a character. He had held the office of Justice of the Peace, when governors were not very particular as to whom they gave the office if well recommended. He used to read the Declaration of Independence and other Fourth of July documents, together with effusions, on the great and glorious day in his native town.

In his later and less prosperous days he was easily coaxed by the boys to go through with the same performance for a few drinks when the day of all days came around. He was harmless and well liked by all. It was well known to the local gunners that he was partial to loons, so all the loons shot in his neighborhood were reserved for him, and on the return of the gunners, if one of these birds was in their bag, he soon had it.

One time, two parties of four each had been for shore birds on the bay shore, and happening to meet on their way home, it was found that one of the party had a loon among the results of the day's sport. The fowl was being carried home expressly for the Squire. He had said at the village post-office a few nights before that it was all nonsense about a loon being so hard to kill as some of the young men had stated then and there, so it was proposed that the loon should be put up and each of the eight gunners give it both barrels. No sooner said than done, and a worse looking wild fowl never was seen, although good distance was given on the shots.

In due time the loon was presented and shortly heard from, as one of the boys asked the old gentleman how he liked that fat loon, his reply was "Pretty good, pretty good, but badly shotted. You didn't give him a chance to dive, did you? Sunk him, I reckon, 'fore he gathered."

The old gentleman could catch more pickerel and larger ones with a piece of salt pork, than any of us could with all the Buell, spoons, or any of the "new-fangled notions," as he called them; so we wise ones watched when the old gentleman went out, and happened on him with a small bottle of something good after he had secured a prize. He could not resist a good drink, and never gave us away as not being the real capturer of the fresh-water leviathan. Peace to his ashes: he is gone, and we now have to capture our own big fellows or go without. REIGNOLDS.

MOOSE IN MANITOBA.

Editor Forest and Stream:

I can tell your inquiring correspondent, "W. D. W.," where he can find moose. Six miles from the railway station at Carberry, Manitoba, is a tract of woods covering twelve townships, extending from the Canadian Pacific Railway track south across the Assinaboine River, a distance of twenty-five or thirty miles, to the Tiger Hills on the Louris River, which shelters more of the deer family probably than any other portion of the Northwest of equal extent. Outside of the wooded district is a great extent of waste land, sand hills, lakes and ponds, and oak parks, extending east and west along both sides of the Assinaboine from Burnside station to Chater, about sixty miles.

This region, not being suited to farming, has been left as wild as when the Hudson's Bay Company alone ruled these fertile prairies, and is only invaded by white men at rare intervals, when some ambitious sportsman from the East starts out for big game. In the whole distance I have named there are not more than a dozen settlers visible from the railway, who have picked out some favored spot to make their home. One, a sturdy pioneer named Oswald, near Austin station, tells me has seen thirteen elk in his stable yard when he got up in the morning after the first snow last fall, and the sight of single animals or two or three at a time is not at all unusual. My team went to the woods

every working day last winter from the 1st of November, and the driver said he seldom got to where he cut his load of wood without having seen the tracks of from one to five large deer, moose or elk crossing the road, and frequently saw them moving leisurely along. I have the Indian trade at this point, and last winter the hunters in one camp, four Indians, sold me at one time the hindquarters of eight moose. I bought none from them after Jan. 1, but they told me in the spring that they had killed twenty-nine during the winter, moose and elk.

I can promise "W. D. W." that there is plenty of his favorite game here, but about the chances of success I can't say certainly. They will be small unless he is a skillful hunter, for a green hand has no business with moose. I am very fond of sport, and have spent the last five years of my wandering existence between the Red River and the Rocky range, but have never killed a moose yet, and can amuse myself quite well with jumping deer, geese, ducks and chickens, of which there is no end. Nothing would please me better than to welcome "W. D. W." up here, but our laws will not permit him killing any of the deer family before October. Carberry is 105 miles west of Winnipeg. There are good hotels and livery stables, and a horse and buckboard can be driven to the haunts of the game, making the trip an easy one to take. NORTHWEST.

CARBERRY, Manitoba.

PROPOSED MICHIGAN PRESERVE.

WE have received from Mr. Frank N. Beebe, of Columbus, O., the following extract from a letter addressed to him by a resident of Michigan: "Could a company be gotten up to buy from ten to thirty thousand acres of forest land lying on the shore of Lake Huron for a hunting and fishing park? The land could be now bought cheap, and the location I have in mind is as good hunting ground as there is in Michigan, and I think I would be safe in saying that the deer on 10,000 acres of this tract would not count less than 600 at present, and I am sure that as many as 200 have been killed there during last season, for they were hunted all summer, and even up to the present time. The deer have been steadily increasing here for the past ten years to my own knowledge, but now that Cheboygan is growing and hunters from other places are flocking in here in greater numbers, there is danger of the deer being exterminated. Now, I have an idea that a company could be gotten up to buy anywhere from 10,000 to 30,000 acres of this land, and fence it in with a high wire fence on three sides, with Lake Huron on the fourth. A great portion of this land is good soil and contains a large amount of timber (young pine), and would, I think, prove a paying investment if it could be bought up at $3.00 per acre or less. There are two or three trout streams and several small lakes or marshes, where great numbers of ducks could be killed in the spring and fall. This tract would begin at a line joining my place, and running east on the lake shore." Mr. Beebe says: "I know Mr. Elliott to be a practical and enterprising man. He has positively demonstrated this in his successfully pushing through to completion an enterprise in the nature of a stock stream and hatchery for brook trout, which he is now giving his attention to. Mr. Elliott is thoroughly reliable, and any undertaking he may assume will be carried through to completion to the best of his ability."

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I suggest the loading of shells with nothing else but wads and let some of those who have so much faith in wadding try how their guns will shoot with that style of loading. Every one that owns a gun is not supposed to own a wad factory also. I do not think a gun is much force that will not shoot decently with two good wads on powder and one on shot, if the man behind the gun is up to the mark. We are having fine rains and the prairie is in fine condition, and the prospects are good for a fine crop of birds in the fall.

GEORGE ARMSTRONG.

CARTRIDGE LOADING.—The Chamberlin Cartridge Company was recently organized in Cleveland, O., with a capital stock of $250,000. The device was invented by F. L. Chamberlain, of the Variety Iron Works. The preliminary work has already been done by having patents issued in the United States, Canada, England, France and Germany, in which thirty-five different patent claims have been allowed. The patent is a machine for loading shells to be used in breechloading shotguns. The machine has a capacity of 1,500 shells per hour, and will, as soon as the works are started, be put to work turning out if necessary 225,000 shells per day. By this invention the shells will be filled in a much more uniform way than any heretofore used. Through a very ingenious device in the patent the pressure on the wads is adjustable up to 100 pounds. The company that has been organized for the manufacture of the shells under this patent intend to start a factory, making use of the latest apparatus and appliance necessary to the successful and rapid manufacture of this important article. The company expects to start with fifteen machines, and intends to be able to turn out twenty millions of shells this coming year. The men who have hold of this scheme and who constitute the company and directors are all prominent manufacturers. —*Cleveland Herald.*

WILDFOWL IN PENNSYLVANIA AND NEW JERSEY.—The passage of the act relating to webfooted fowl by our Pennsylvania State Legislature, which forbids the killing of ducks excepting on every other day of the week, and the sailing on them with any sort of craft, gives great satisfaction to Harrisburg sportsmen, as duck shooting on the Susquehannah River in the section of the State near our capital had become a thing of the past owing to the continued harrassing of the birds. Now, I am told they will come up the river from the lower ducking grounds when it becomes "too hot" for them and will frequent the old resorts. If the law could be extended so as to effect the Delaware River it would be a benefit, but we cannot expect this to be done until the State of New Jersey passes a similar act and both State shores be protected. A law limiting duck shooting to every other day in the week in the Delaware on the Pennsylvania side of the stream while New Jersey allowed every-day shooting on her shore would not work, and would result in endless dispute and allow many loopholes for escape to the violator.—HOMO.

TAKE PARTICULAR NOTICE of this extract from a market report in the New York *Evening Post* of late date: "The efforts of our chief dealers are to be used shortly to gain permission to refrigerate game in its season and sell it at all seasons. As it is, all refrigerated game goes direct to Europe, where it is to be had the year round."

A CARD FROM MAJOR VERITY.—Adironda, June 28.—*Editor Forest and Stream:* I notice that one of your correspondents, in writing of the performance of shotguns, says, "but few persons know what they are writing about" (further on giving the proof that he is not one of the few), and that "*General* Verity is as quotable for facts as any of them." And why should not General Verity (I presume he means me) be "as quotable for facts" as any one who makes a plain statement of actual experience I would like to know. If he intends to imply that any and all of my statements will not bear the most rigid scrutiny, he is as little acquainted with my character as he is with my proper title. In the corps to which I have the honor to belong, and which, I trust, has never been dishonored by word or deed of mine, there is no such rank as general. If there is any rank above that of major, it is hardly probable that after so many years' service I should now be obliged to sign myself, very truly yours, *Major* JOSEPH VERITY, United States Horse Marines.

IOWA GAME.—Morning Sun, Iowa, June 24.—Farmers living to the west and south of us report plenty of young prairie chickens, and I have no doubt their report is correct. The weather has been all that an old prairie hen could wish, and by this time there are many bevies that are large enough to stand quite a heavy rain. Our rains have been so far slight showers, just enough to make glad the heart of the farmer, consequently crops never looked better in this section than now. Small grain is in abundance and, of course, there will be plenty of stubble. Then the corn is just immense; so look out for snap-shooting. Quail can be heard whistling at all times and in all directions during the day; in fact, I never saw the game outlook better. The fishing has not been as good as heretofore so they say; but "they say" is such a liar that I won't believe until I try it myself, so look out for some fishing notes before long.—MARK.

NEW JERSEY WOODCOCK.—If the dry weather which we have lately had should have continued until the opening of the woodcock season, many birds would have been killed on the first day of the shooting, as they could have been located in the few wet places that would have remained for feeding grounds; but the deluge which visited us on the 26th thoroughly saturated the ground, and will have the tendency of dispersing the birds, a fact your correspondent is glad of, for they will be more difficult to find and more will be left for autumn shooting, when they should only be bagged.—HOMO.

GROUSE IN SULLIVAN COUNTY.—Monticello, N. Y., June 27.—*Editor Forest and Stream:* I meant to have written in my former note that we have woodcock shooting here in August and ruffed grouse in September. Our law is strictly enforced here.—C. F. KENT.

FLORIDA QUAIL.—Denning's Post Office, Hamilton County, Florida, June 14.—The quail supply promises to be very good next season in this vicinity.—D. M. S.

Camp Fire Flickerings.

"That reminds me."

123.

PERHAPS you never heard of old man Lewis. If you ever go to Lewis Center, in the southern part of the great State of Ohio, quail shooting, as I did a few years ago, you may run on to him. I wish I could photograph him, with his old, black, two-inch stemmed pipe, which he would puff energetically and parenthetically to enhance the interest of his narratives; his hair, which had never been combed since the day he was born; and his shirt, which apparently had never been washed since a long time before that.

"Talking about turkeys," said he one day, "we used to have lots of them. Jonas Leach lives about a mile from here. We used to hunt them together. Jonas was a pretty fair rifle shot—used a small-bore—about 180 to the pound. In October, just eight years ago, there was a light fall of snow. Jonas and I started out about 10 o'clock in the morning, I was on horseback; we struck a track over east. Jonas cut across about two miles to the runway, for you must know turkeys have their runways just as deer have. I followed slowly upon the track. When I got pretty near where Jonas was stationed, I heard the sharp, whip-like crack of his rifle, and hurrying up found him composedly driving down another bullet, while about fourteen rods from him the turkey was executing a very complicated series of ground and lofty tumblings. I went over to the bird, and after careful examination, much to my surprise could not find where he was hit. Jonas came up. Says he, 'Open his eyelids.' I did open them, and found the bullet had gone in one eye and out of the other, not touching the lids at all. Jonas said he came along broadside and running like a quarter horse." ALIQUIS.

124.

Some fourteen miles from this place are two notable mounds about a half mile apart. In an early day, some forty or fifty years ago, Uncle —— settled upon the summit of one. Uncle —— is a staid and venerable patriarch, highly respected, but not given to telling stories, and particularly averse to sensational yarns. Not long since quite a crowd was gathered in a certain store, and the young bloods were telling of their great exploits and how they could "lametuem" at one hundred yards with the modern B. L. and No. 10 shot, when Uncle —— cleared his throat—which caused all eyes to be turned upon him, for it was well known that any incident in his long and varied experience must certainly interest the present generation—and began: "About forty years ago, when I lived on the top of the knob, I got up one frosty morning and went out on the porch to wash, when I happened to look over to the opposite knob, and there stood a very large buck on the very top of the knob, his broadside to the sun, and at least a half a mile from where I stood. I concluded to try him anyway, so I went into the house and got down my old Kentucky flintlock, which had seen a good deal of service, but which had always proved reliable, and taking a dead rest from the railing of the porch, I drew a bead on the top of his shoulder and fired." Uncle ——, resting his chin upon the top of his cane, stopped short, and seemed to be in a deep study, and from the gravity of his countenance it was not unreasonable to suppose that some sad reminiscence of the long ago was flitting before him, when the reverie was disturbed by the modern B. L. champion calling out, "Well, Uncle ——, did you kill him?" The reply was short and sharp: "No, sir." OCCIDENT.

SEDALIA, Mo.

Sea and River Fishing.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—VIII.

THE other boys came to camp a half hour or so after us, with a string of fish tied to each boat that made Dick and I feel like the tail end of a streak of bad luck, but we consoled ourselves with anticipations of better sport next day, nor did we fail to hold up our end at the table when Frank served up three or four of the choicest of the day's catch, crisp and brown and piping hot for supper.

Jim and Knots had a fish story to tell us, about something that happened as they came down the lake that evening after they had quit fishing, illustrating the boldness of the maskalonge when pressed by hunger, and that went far to confirm neigbor Merrill's assertion that "there's some big ones in this lake," a story which we would have given a wide margin to, had we known them other than as old and tried friends of unquestioned veracity. "Sid," a lad of seventeen, the oldest of Merrill's boys, was rowing for them, and as they passed the mouth of Rocky Creek he cried out excitedly, "Lord what a fish!" and turning as quickly as they could, they saw the broad tail of a great maskalonge as he disappeared from sight near the stern of the boat with a swirl that made the water foam. He had actually made a dash at their fish which were towing alongside the boat near the stern, but had missed them and his supper at the same time. Jim said, in relating the story, that "it was the sublimest exhibition of colossal cheek that had ever come under his editorial eye," and it certainly was a bad showing for the fish when the fact is borne in mind that Jim runs a weekly newspaper largely given to politics.

Sid was the only one in the boat that got a good view of the fish, as Jim and the Scribe were facing the bow, and only turned in time to see his caudal as he gave it a mighty flirt and dashed out of sight. I asked Sid how long the fish was, and he replied with simple candor, "He was about as long as I am; I tell you he was an awful big fish;" and we could well believe it, for Sid was near five and a half feet in height.

Old Ben sat off to himself smoking and addressing a quaint remark now and then to the mosquitoes, apparently absorbed in his own reflections, but after a while he hitched his stool nearer the fire and said in his deliberate way, "Tell ye, boys, if there's many o' them kind o' fish in the lake, I 'low Ben better do his fishin' from the shore, where a feller kin hev a chance to dodge"—two or three puffs at his pipe, which had gone out—"but I hev my doubts about that bein' a fish. I seen a musrat this mornin' swimmin' 'long nigh the mouth o' that crick; wonder now"—reflecting—"if it wasn't that musrat that was after them fish?" Here he swapped legs and winked violently at Dick.

"Guess I know a musrat from a muskalunge," said Sid quickly, and the laugh that went round effectually squelched Ben and his doubts about the maskalunge, and left Sid master of the field.

Ben made a pretense of being floored by scraping a match on his breeches, lighting the brier-root and taking refuge behind a cloud of smoke, through which we occasionally caught a word of a desultory conversation he was holding with the skeeters, but a suppressed chuckle now and then indicated that the shot he had fired at Jim and the Scribe was giving him vastly more satisfaction than his controversy with the insects. But the fire was getting low, and the experience of the day having all been gone over, the conversation flagged, pipes went out, the circle broke up and the Kingfishers went to roost, a tired but happy family. I will not attempt to tell about the delicious sleep I enjoyed that night on the fragrant bed of balsam boughs that Frank had made in our little tent during the day, but will just leave it to be guessed at by any unfortunate brother who has missed the luxury of stretching his tired frame on a bed of "balsam feathers" after fishing all day without a nibble.

Next morning, after an early breakfast, we decided to fish the lower end of the lake around the mouth of Little Black and Sturgeon bay; Dick and the Deacon preferring, however, to try at the rocks again for bass, and also to fish the water carefully where the big maskalonge had been seen the evening before.

Dan and I left camp some time after the others had gone, and had barely cleared the streak of grass in front of camp when the old Pelican looked up, and said quietly, as a dozen yards of line ran slowly from the reel, "Hold on, Hickory! There he goes. Pickerel or masky, from the symptoms."

A long, sweeping "wipe" fastened the fish, and two strokes of the oars sent the boat out into the lake, away from the grass, where neither could get an unfair advantage over the other in the coming fight. The fish made a dash for the weeds, but old Dan being up to about all the tricks of the pike family from a careful study of their habits, soon had him headed out into the lake, and then the fun began, for it is fun to handle a powerful pickerel, boiling full of fight, which this fellow proved to be. Shortening the line as he came on, Dan was prepared for the usual plunge under the boat; but a sudden and unlooked-for dive for the bottom by the fish took three feet of the top of the arched rod under water and nearly tilted the old Pelican into the lake, a calamity I averted by jerking the stern of the boat sharply to starboard, which restored his perpendicular and gave him time to whip the rod around clear of the boat and save his line from parting.

"Did you ever see such an obstinate devil as that?" said the veteran, as he braced himself and tested the full temper of his rod in a desperate struggle to turn the fish, which had again started with a headstrong rush for the grass. For a half minute the issue was doubtful, but grit, grunts, and a thoroughly trusty rod, prevailed, and he once more swung out into the lake still full of fight, while I kept the boat in just the right position to make the rod do most of the work, for it must be remembered that old Dan has only his left hand and arm with which to fight his battles. Another dash under the boat as he came around, and another last effort to reach the grass played the fish out, and he was brought alongside, when I jerked a gaff into him and yanked him into "the middle o' next week," without giving him time to move a fin in remonstrance. He was a handsomely marked pickerel of seven or eight pounds, and one of the gamest fighters Dan had ever forced to yield to his skill, and he was highly pleased over his victory. First blood for old Dan. But my turn came soon after, and I had begun to think it high time.

From here nearly down to the point a couple of miles below, we took half a dozen more pickerel, but the bass were not pleased with our bait, and we took none. We had lost

the streak of grass running parallel to the shore, and while hunting for it found another narrow grass and weed-grown reef a quarter of a mile or more from shore, that led nearly straight out across the lake; and along this for three or four hundred feet we had some rare sport with the pickerel, when it, too, came to an end in the deep water. We pulled back along the north side to where we had first struck it and then fished along the south side again back to the deep water, and during the time I don't believe five minutes passed in which we were not handling a pickerel, several times both busy at the same time. At the end of the reef we had enough of it, and as this was the day we expected the Assistant P. M., we concluded to pull across the lake to the "sand bank" and intercept him on the road we had passed along a few days before, and save him the long drive around the head of the lake. First, however, we selected a landmark on each side of the lake, by which we could readily find pickerel reef—as we named it—again, should we want to pay it another visit, and Old Dan would be sure to do this, for he is "powerful fond o' pickerel fishin'."

When a hundred feet or so from the last weeds growing up from the end of the reef, our blood was started into quicker flow by a sight that I am certain neither of us will ever forget as long as we remain "on the face o' this livin' earth." We were watching our lines trailing astern when suddenly we saw an enormous maskalonge leap three feet into the air directly athwart our course and fall back into the water with a great splash ten or twelve feet from where he left it, and disappear with a sweep of his tail that made the spray fly in a small shower. He was not more than sixty feet from the stern of the boat, and we had a fair and full broadside view of him while he was in the air. I am now almost afraid to write down our estimate of the size of that monster maskalonge lest the brethren braud Dan and I as a pair of lying old loons that have a fish story to tell, yet we are both willing to make solemn oath before any magistrate in the land that this fish was six feet or more in length. He looked as large around at the ventrals as a common wooden bucket, and I am as sure as I can be without actual measurement that his tail was a foot and a half broad from lobe to lobe, while his long, powerful jaws, slightly apart and armed, as they must have been, with rows of murderous teeth, looked like they could easily crush a man's arm.

Merrill had said to us, "Boys, there's muskylunge in this lake six foot long, sure's yer born, for I've seen 'em!" and we had simply marked it down to him as one of his whoppers, but now, here, with our own eyes Dan and I had seen one out of water at close distance that was even larger, and we could not dispute the evidence of our eyesight. I would not have believed maskalonge attained to such great size had not Dr. Sterling (I write this with nothing to refer to and will stand corrected if my memory is at fault) put one on record, killed some years ago somewhere near the head of Lake Huron, that weighed eighty pounds, but I believe old Dan and I would have been little more astonished than we were at sight at this one, had we seen another the same day that would have measured twelve feet. The fish that tried to rob Knots and Jim off the mouth of Rocky Creek was no longer to be poked at them as a "mus'rat," and we mentally took back a good many things we had been thinking about neighbor Merrill, we could even believe the very biggest bear story he could frame. When we told him next day what we had seen, he said, "I told ye so; mebbe you'll b'lieve some o' the old man's lies yet before you go home."

When the great fish struck the water after his leap old Dan glanced over his shoulder at me, and exclaimed, with more excitement than I had known him to display for years, "Great guns, Hickory! did you ever see such a fish as that?" or words to that effect. I don't remember just now the exact reply I made, but it strikes me at this late date it was something more forcible than elegant, for I was like Major Lacey's "coon" during the war when the whiskey gave out on a hard march—"all to'e up in my mine"; but instantly dropping the oars into the water, a vigorous back stroke sent the little boat five yards astern, and reeling up quickly I made a long cast and dropped the frog several yards ahead of where old mossy was last seen, with a faint hope that he would take a notion that a speckled frog was just what his teeth were aching for, instead of the pickerel he had probably made a dash at when he left the water. The cast availed nothing, and turning the boat quietly we fished for half an hour over twenty acres of water in a dozen directions from where we saw him, but frogs and spoon victuals would not tempt his appetite, he was too "facetious," as Dick would have said, and we were forced to abandon our designs on him and take our way across the lake with heavy hearts.

Had we stopped to give the matter a serious thought, we might have had sense enough to know that the tackle we were using that day would have been just about as effective in stopping that fish as a mosquito net would a stampede of Texas steers; but our blood was up, and we never thought once about the frailty of our lines and rods until we had cooled off, and not until we had settled it in our minds that he would weigh not under eighty or ninety pounds did we realize what immense strength this fish must have been possessed of, and how utterly futile our efforts to capture him would have proved with the means at hand. We determined, however, to contrive a rig on the morrow from material in my "calamity box" that would bring to grief this mighty warrior or any other fish that would attempt to fool with it, for once hooked, the victim would have to lose his jaw, be turned inside out or jerk the bow stem out of the boat, and failing in any of these possibilities, be towed ashore and scientifically knocked on the head with a club, made and provided for that purpose.

We pulled across to the sand bank, a spot bare of trees which the lumbermen had at some former time used as a place to get logs into the lake, where I left Dan to chuckle over the scheme we had devised to capture the great maskalonge, and pick huckleberries along the strip of low land between the beach and the foot of the hill, while I took my way up the steep, sandy log road leading out onto the plains to the main road, some twenty rods back, where Miller would have to pass along. At the forks of the road I left my "totem" in the shape of a couple of good-sized dead pickerel brought with me from the boat, and hung to the fork of a small bush which I cut, trimmed and drove into the sand two or three feet from the roadside.

These would be sure to scare the horses when they came along and attract the driver's attention if he were not too full of huckleberry juice. To make it all clear, I tacked a leaf from my note book to a blackened stump a few feet further along, on which I penciled a notice to follow the right hand road to the lake, where we would be waiting at the beach or in sight.

Back in the boat again, we fished and waited around within half a mile up and down shore till 3 o'clock in the afternoon, without seeing or hearing anything of Brother M., when, becoming impatient to know what the boys were doing, we pulled across down to the mouth of little Black, with our minds made up that should he come to the sand bank that day it would take the tallest kind of smoke signals to induce us to go back after him.

On the way down, after crossing the lake, we passed the little side-wheel steamer City of Cheboygan lying at anchor near the shore, a short distance above the mouth of the river, one of the line that formerly carried passengers by the inland route—Crooked, Burt and Mullett lakes—between Conway Springs, at the head of Crooked Lake, and Cheboygan, but now kept here on Black Lake in the more humble service of towing logs to the outlet for their start down Big Black River to Cheboygan.

To get this boat up the river and into the lake was a task that no one but a Michigan lumberman perhaps would have undertaken, as there are some bad rapids about three miles from the foot of the lake that no steamer or rowboat can surmount with any ordinary means of propulsion; but the difficulty was overcome, we were told, when the water was up in the spring by "warping" her over the rapids and into the easier current above.

But these Michigan lumbermen are a hearty class of men; quick to think and fertile of resource in emergencies that require prompt action and a cool head in solving on the spot a knotty (pine) problem, and no undertaking is too great for them when it comes to a matter of getting logs to a market. Their education is not considered finished until they have learned how to "float a four-foot log on a foot o' water," and, indeed, water appears to do almost anything for them required of it except to run up stream.

We found the boys surfeited with pickerel fishing and about ready to start back to camp, but Old Dan, as before mentioned, being powerful fond o' pickerel fishin', we concluded to hang around Sturgeon Bay till near sundown, and while fishing mainly for long snouts would not forget to "feel fur a bass" between times, as we had not taken one that day.

I may say, too, that this matter of being fond of fishing is not to be all loaded on to Old Dan, for I don't remember the time, in all the pleasant years we have been angling together, when one was anxious to quit before the other, in sun or rain, or wind or snow. We tied the boat to a small raft of squared timbers, firmly pinned and bolted together, anchored fifty or sixty yards off the mouth of the river, and got out on it to rest a while and fish. This raft was a puzzle to us, and is yet, as we failed to ask any one its particular use, but we figured it out to be some kind of contrivance connected with the booming of logs, as near one end was a rude capstan, and to the shore end were chained two lines of boom logs running out to shore and up the river several yards, one on either side. Into this boom the logs are confined as they come down the river, and the capstan and coil of inch-and-a-half rope near it were used, we had a notion, to warp them into compact shape for towing to the head of Big Black River.

If we are wrong, the lumbermen may laugh at us, and we will take a back seat until we have better learned their ways. One writer in FOREST AND STREAM has called it a "head works," but Old Ben christened it "the stem-windin' raft," and by this name we knew it.

We spent a half hour on the raft without taking a fish, and getting back into the boat we pulled around into the little bay to the head and back, taking on the way a few long-snouts that hardly paid for the time wasted on them. We soon tired of this sport, and as the bass were not in a biting humor, we said we had enough, and started for camp, which we reached a little before dark, tired, hungry and happy, but a trifle disappointed over our poor luck with the bass.

No smoke signal at the sand bank and no brother Muller that day.

I don't remember now the number of pickerel brought to camp that day by all of us, but they certainly would have filled a flour barrel. No bass were taken, however, except three or four by Dick and the Deacon up at the Rocks, and these were kept for our own table, while the long-snouts were turned over to neighbor Merrill, who had said to us, "Boys, don't throw away a single pickerel; bring 'em to camp for me an' I'll clean 'em an' salt 'em down."

We kept no count of the number brought in and given to him during our stay, but Ben said, "Ef old Merrill lives long enough to eat all o' them pickerel an' stops to sort out the bones, he'll be creepin' up to old Methuseler that you read about in the Scripters, an' he won't hev no more hair on his head'n a base ball."

KINGFISHER.

[TO BE CONTINUED.]

A DAY AT MINNETONKA.

MAT and I have just returned from our long-expected trip to our most beautiful lake, and we return loaded with fish and pleasant recollections. On arriving at Excelsior we were met by Bill Corbett, the best of the Minnetonka boatmen, and our genial host, De Groot. "Well, gentlemen, said Bill, "it's 5 o'clock sharp to-morrow morning, for we must make a good day of it." Five o'clock found us on our way to the bass grounds in Bill's comfortable boat. After an hour's pull the fun commenced. We wanted a few croppies for lunch, so we stopped on a croppie bed the first thing; this resulted in a dozen fine croppies and one bass of over four pounds' weight. After a short row we reached our favorite bass grounds and prepared for business.

Considering the weather, which was not favorable, we had very good luck, and were more than satisfied. At noon, we had twenty-five bass. Bill cooked some croppies for lunch, and we enjoyed them exceedingly. After lunch we were up and at it again, and when we started for home we had thirty-five bass, a dozen pickerel and twenty croppies and red-eye, or rock bass; the entire catch weighing over ninety pounds. We used 12-ounce rods, with both frogs and minnows for bait. The most successful way to fish here is to cast with frogs. Bill rows the boat slowly just far enough from the rushes so we can cast into the "pockets," as he calls them. When one strikes a three or four pound bass there is plenty of business for him to attend to. We were fortunate in not losing many, and our string of bass were all very good size. We had one pickerel that weighed seven and one-half pounds, and several others of fair size.

The Minnetonka bass are very satisfactory fish to catch. They are very stubborn fighters and are above the average in size. We brought home eleven that weighed thirty pounds. It was a very pretty string of fish, and the fun we had catching them is beyond description. The pickerel and other fish we left with Corbett.

If any of the readers of FOREST AND STREAM should be in this part of the country and wish a good day's fishing I would advise them to try Minnetonka. It is conveniently reached from either Minneapolis or St. Paul, and the hotel accommodations are first-class. It is necessary to get a guide to insure good sport, and Corbett is the man to get. He is a sober, honest fellow, and knows the lake from A to Z. His boat and general outfit are the best on the lake, and as an oarsman he is without a peer in this section of the country; his early training in rowing the ferry at Staten Island shows itself in every stroke. He is also an artist with the frying pan, and cooks fish to a turn. His address is Excelsior, Minn., and visitors will always find him ready and obliging. At present the fishing is at its best, and large strings of bass and pickerel are caught daily. One prominent Minneapolis insurance man caught 150 pounds of pickerel in one day last week. We shall try it again soon, and if all things are favorable we hope to set a high mark for the rest of the boys. If luck is with us you shall know of it. JUDGE.

MINNEAPOLIS, Minn., June 14.

TROUTING WITH A WORM.

TO one who is prevented by business cares and unkind fate from enjoying the sports of forest and stream in the wilds and byways where civilization has not yet encroached, the weekly perusal in your columns of the exploits and delights of those more fortunate is ever a source of pleasure. While reading many a wonderful tale of luck with rod and reel, where vigorous trout or gamy bass were secured with scarcely an effort, it occurs to me that while repining at fate for the denial of such luxury, there may still be a redeeming feature, and that even the scarcity of the sport may give an added zest, and while to those of your readers who are accustomed to roam at will, wherever their fancy may direct them in search of sport, this article may be uninteresting; there may be those who, like the writer, must fain be content with humbler sport in whatever locality fortune has placed them. Among these then I may find sympathizing readers.

From boyhood's days, when my mornings and noonings while at school, during the season, were spent by the side of some favorite stream, have I been an ardent devotee of the rod and—I was about to say reel, but now I remember the reel was not considered then a necessary adjunct to the sport, nor have I ever with rod or reel experienced more pleasure than in those boyhood days when with birch or alder "pole" I drew from beneath some sunken log or overhanging bank an unusually fine trout. With what pride did I exhibit my catch to a circle of admiring school fellows who usually accompanied me to see the sport and carry the fish (usually strung on a willow "string"), and with what eager zest did I ply the rod under the banks and down the ripples of that willow-bordered stream, and seldom was I unrewarded.

Many a happy hour since that day have I spent with rod and reel, and although not always with success numerically speaking, yet a day spent adown a mountain stream or through the grassy meadows, following the intricacies of the willow-lined banks, I count always a successful day; for it is a quiet day, where one is sure to escape the worry and wear and tear of business life, and Father Time with his relentless scythe is cheated into many an hour of extra waiting. For the past few years circumstances have placed me within easy access to the streams of Berkshire and Hampden counties, Mass. Berkshire is called the Switzerland of America in point of scenery, and you will find among its glorious mountains many a secluded stream that would delight the eye of any angler. Hampden county is not behind, and I can recall many a delightful trip to its enticing streams.

It was in the early part of June, one glorious morning, I found myself at the headwaters of a stream I had intended to visit several preceding seasons, but had been prevented for various reasons. I was alone, with miles of the glorious stream before me; one glance down its rocky course, its deep, dark pools and silent eddies was enough to put me in an ecstasy of delight, and before I cast a line in its enticing waters I had drank one deep draught of unalloyed perfect happiness. For those whose cultured tastes will allow them to use nothing but the fly in capturing their trout, this narrative will have no further interest, for candor compels me to say my bait consisted of worms, nothing but worms for bait. Although the fly is perhaps the neater way of capturing fish, yet I have been "trouting" with your expert fly-fisherman, who boasted of sixteen trout weighing sixteen pounds caught in Adirondack waters one morning before breakfast, and at the end of the day's sport have given him my handsome "mess" of trout to fill up his empty creel, so that his reputation at home might not suffer. Somehow I then got the notion that perhaps there might be required some small degree of skill to entice little brook trout even with a worm.

The day was auspicious; just warm enough, with moist-looking clouds that now and then obscured the sun and now and then a little spatter of rain.

With cautious movement I cast my hook where experience taught me trout should lurk; into many a dark pool beneath some sunken log, or in the shallow ripple, but in vain. Although the stream was a picture that was ever a source of delight, still the trout were not there or would not bite.

Still, not to be disheartened, on I went, ever casting with painstaking into most favorable localities, but ever without success. Once, while poising upon a boulder in midstream, I was nearly frightened out of my senses by an old partridge, the mother of a brood, which, with head depressed and wings extended, darted suddenly at me from the bank with a hissing noise, and leaping into the stream beat across the surface with her wings.

Then I went on down stream where the water lay quiet in long, silent pools with alder banks, and still without success. There must be trout in the stream and they must be made to bite; but how?

There was perhaps a mile of still water and then the stream once more babbled away in its rocky bed. Fed by one or two small tributaries it had increased considerably in volume. Now stop! Is it a snag? No, a bite, the very first! Now he has it; with a quick turn of the wrist I secure him and lift him gently out—a little beauty. There was no whirr of the reel, no dexterity of handling and still, as I looked upon his plump symmetrical form with its spots of color, it was with no small degree of satisfaction. The first trout; and pulling a bunch of cowslips to line the bottom of the creel, I place him tenderly on them.

Now I go on with renewed zest. I feel that the luck has changed and my slightly waning courage is again revived. Lengthening my line, I made a cast across the stream to an enticing-looking ripple under an overhanging bank. No

sooner cast than seized, and in a trice I land him, a plump "quarter pounder."

With care I continue, omitting no ripple or pool, and increasing the weight of my creel materially. Now I approach a long, shelving rock, down which the water glides silently and swiftly, pausing and swirling occasionally in little rifts and hollows, then on some sixty feet to a long, deep pool below. Will trout take the bait in such swiftly running water? Although but a few inches deep, it nearly takes me off my feet as I wade out for a more favorable cast, which proves immediately successful, and jumping its length out of the water, down darts a trout to the pool below. Without changing my locality I reel him in. Then I caught them all the way down the incline, and at the foot added four more to my already pretty solid basket.

Half a mile further down, by its "rush and its roar," I know I am approaching a fall of unusual height, and on reaching it I find myself on a cliff above the falls that drop perpendicularly twenty feet. My basket has grown heavy, and by the size of the pool I see it is good for a half hour's work. So off comes the basket, and just then I am reminded of a lunch box in my pocket and I resolve to refresh and recruit before commencing operations below. But first I must take a peep at the beauties snugly tucked away in the basket, and they are beauties, looking so fresh among the green cowslips and brook mint upon which they rest so sweetly. I have been more than busy the last half hour, taking one from a ripple and another from under the bank wherever a hiding place was found. I turn them out on the broad, flat rock, and placing them side by side, the largest at the head, and count them. Forty as handsome trout as fisherman ever beheld; there were no "pounders," neither were there any fingerlings; all fair fish of from three ounces to six or eight ounces.

Taking great care with my bait, I drop it down into the pool, but the water is so rapid that it sails away on the surface. Again I try, a little out of the current, but with no success, and I am beginning to think it the biggest kind of a fraud, and with some indifference I swing the bait up into the white foam. It drifts behind the fall and remains stationary. Is it backwater or a trout? A gentle feeler convinces me that it is the latter, and that he is no mean fish. I rise from my sitting posture and cautiously try his weight, when, smarting from the prick, he rushes out and I catch a glimpse of his glistening side in the white foam. A beauty, and if I don't save him I will swear he is better than a pound. In all probability he is the largest fish I will hook to-day and he must be mine, and with all the skill I possess I play him from the rock to the pebbly beach below and land him, the crowning triumph of the day, and fully justifying my expectations as to size and weight.

Oh, the witching of that fair stream! How it enticed me on and on; never monotonous, ever changing, some new beauty constantly arising—

> "Advancing and prancing and glancing and dancing,
> Recoiling, turmoiling, and toiling and boiling,
> And so never ending, but always descending."

If those who delight in capturing with the fly the trout in Maine or Adirondack lakes are inclined to look down upon the commoner sport of catching trout with bait in mountain streams, let them one season try some of the streams in either Berkshire or Hampden counties, and, if they are lovers of nature as well as anglers, they can but admit that even this, too, has its charms. TUNXIS II.

ANSONIA, Conn.

BOW RIVER TROUT.

HERE I am this early A. M. seated on the stump of what was once a huge cottonwood, just a quarter of a mile from the business center of the infant city of Calgary, on the Bow River, not merely to watch

> "The rippling, joyous waters as they playfully flow,
> And upon the pebbly beach their passing kiss bestow,"

but to throw the tempting gray fly to the speckled inhabitants of those clear, deep, blue waters. Calgary, the future capital of the proposed new province of Alberta, is a one-year-old infant, yet it has a population of 800, and it is destined to grow in a short time to the dimensions of a city. It is beautifully situated in a circular valley, a basin the rims of which almost surround it, leaving an open space along the trend of the river by which the Canadian Pacific Railway enters and pushes its way beyond to the great Canadian Alps. It is a lovely morning, and the Devil's Head (a peculiarly dark-looking, dome shaped mountain) can be seen to great advantage. The eternal snow-clad peaks show above the rim of the basin, their tops and sides looking like huge sugar cones, cubes and pyramids, or like great circus tents, far beyond anything that Barnum has ever attempted.

I am casting my line into one of the best and largest trout streams in North America. The Bow is a large stream, but it is unnavigable on account of the swift current and rapids to be met along its course. Where I am fishing it is less than one hundred yards across, but the waters are deep and so clear that the bottom is visible at a great depth. The Bow is mountain fed, and it abounds with mountain and brook trout. They are both numerous. The former grow to a very large size, but the average weight of those caught in this vicinity is from two to two and a half pounds. They originate in the numerous lakes which find a bed in the many ridges which comprise the rocky chain.

The brook trout here is in all respects similar to that toothsome fish found in eastern waters. It averages about a pound, and it is as wild as the rugged scenery which meets the gaze of the angler as he casts his eyes toward the surrounding horizon. I have fished all over the eastern provinces in the trout lakes and streams, but the sport there is tame and discouraging compared with this. I have already landed thirty-one, of which several are mountain, averaging from one pound to three and a half. They take the fly more readily than the bait, as there is a kind of river fly which at this season is their natural prey. It is a dark gray, and the nearest approach to it I have is the common stone fly. The bustle and activity of a new town, however, are scaring the fish, so much so, indeed, that it will soon be necessary to fish two or three miles away from the town, far from the noise of hammer and cart. How the Eastern angler, who swelters all day in the heat, covered with mud and bored with flies, would like to throw a line into this stream if for only half an hour! He need not fear that the sport would surfeit. It is not a case of "fish murder" at all here, for, although the fish are plentiful, it takes work to hook and land each fish, because they are the shyest of the shy, unused, of course, to be disturbed; however, there is plenty of sport. I have unearthed two or three real Waltons in Calgary. One of them, Mr. Wm. Bannerman, the postmaster, was formerly a member of Parliament at Ottawa for the County South Renfrew. He wears his casting line around his hat during business hours, and he is a most enthusiastic trouter. The other day he went up the river three miles and came home with eighty-six fish, or one hundred and twenty pounds of trout! An enterprising German has opened a sportsman's supply depot on Stephen avenue, supplying a want that sportsmen will appreciate, though it is to be regretted that he is not a practical hand. Were such a one to come hither and open out he would certainly secure a most remunerative trade.

There is not sufficient hotel accommodation yet at Calgary. Moulton's hotel, which has assumed the imperial title of "Royal," is one of those portable shells which was manufactured in Ottawa and shipped here and then put together. Tourists coming hither for information and sport should provide themselves with tents and the necessary camp equipage. They will enjoy the life much better besides avoiding imposition. Were it possible to send FOREST AND STREAM a sample or two of Bow River trout they would be forwarded in haste, but at present there is no way. During the summer I may have an opportunity of sending a preserved specimen.

All the little streams which empty into the Bow are laden with the speckled tribe. The Elbow River, a smaller stream, which joins the Bow at this point, is a good trout stream, especially as you ascend it. My catch to-day has been forty-three, sixty-eight pounds. Think of it, and all this in less than three hours, and with the store fly, no vulgar bait, but the genuine casting line. I have seen sportsmen East who have traveled all day and never got even a bite. It is no greater undertaking to travel eighteen hundred or two thousand miles and strike a rentable trout mine than to wander all day without even a nibble. There is no poaching. The angler may come and go as he will, and even if he should get surfeited with trout he is not likely to become weary of the sport, for there is nothing artificial in it. It is the real thing itself. Bow.

CALGARY, Alberta, N. W. T., Canada, April, 1884.

THE ROD AND REEL ASSOCIATION.

A MEETING of the Committee of Arrangements was held at the Metropolitan Hotel on June 24, Hon. H. P. McGown in the chair. Mr. Van Brunt moved that the tournament be held on Harlem Mere, the same as last year. Carried. The secretary read the following letter:

CYNTHIANA, Ky., June 11, 1884.

Hon. Henry P. McGown, Chairman Committee of Arrangements of Tournament of 1884 of the N. R. and R. A.:

DEAR SIR—I respectfully submit the following for the consideration of the committee of which you are the honored chairman, and myself a member.

I sincerely trust that at the Tournament of the National Rod and Reel Association, to be held in New York on Oct. 7 and 8, 1884, there will be given an opportunity for the black bass bait-fisher to compete in a special class for "casting the minnow for black bass." This mode of angling has now become so universal, and the number of its practitioners so great that it cannot in justice be longer ignored.

Before the first tournament of the Association I urged the inclusion of such a contest in the programme, but was met with the argument that there were so few anglers in the Eastern States who practiced that mode of angling that such a class would not fill, and that striped bass anglers outnumbered black bass anglers more than a hundred to one.

Previous to the second tournament I again advised the admission of such a contest, but it was then stated that the conditions of such a class were virtually fulfilled by the contest for "light striped bass casting," as the same weight of sinker, one and a half ounces, was used.

Now, I have reason to think that the number of black bass minnow casters, even in the Eastern States, is not so small in comparison with striped bass casters, as has been stated, while in the country at large the reverse of the statement is more nearly correct. I am of the opinion, therefore, that a special contest for their benefit would fill as readily as the stripped bass classes, for it may be remembered that in both tournaments the number of such contestants was not remarkable. Certainly, a black bass class could do no worse.

Moreover, if the Association is designed to be "national" in its scope and influence, it seems to me that the programme of contests should be so arranged as not to favor, particularly, the anglers of any one section. All legitimate modes of rod-casting should be given a place in the programme, so that all anglers, of whatever section of the country, might have a chance to compete in the various classes and contests.

I must respectfully dissent from the statement that the contest for "light striped bass casting," with a sinker of one and a half ounces, virtually covers the ground of black bass minnow casting. In the first place, there is a wide difference in the tools and tackle of the two modes of angling. In the second place, the methods themselves are essentially different. Thus, casting for striped bass is practiced by using both hands, and an overhand cast, while in black bass casting but one hand, and an underhand cast, is used. In the striped bass contest for light casting a sinker of one and a half ounces is allowed, while in a black bass class the sinker should not exceed a half ounce in weight; personally, I would prefer one of a quarter of an ounce.

Should the committee having the matter in charge decide to try the experiment of presenting a contest for black bass minnow casting at the next tournament, I will be pleased to give my views on the rules and regulations to govern such a contest; and, also, will use my best endeavors to procure some of the prizes for the same, and strive to be present in person at said tournament. Yours, very respectfully,

J. A. HENSHALL.

The chairman stated that he favored the idea of Dr. Henshall, and had so replied to him. The Doctor had again written the following:

CYNTHIANA, Ky., June 20, 1884.

Mr. Henry P. McGown, Chairman, etc., N. Y.:

DEAR SIR—Your favor of the 17th inst. to hand. I am pleased to know that you think well of my suggestion, and will advocate a black bass bait-casting contest at next tournament. I wrote you that I thought I could procure some of the prizes for same. To-day I received a letter from Thos. H. Chubb, who says he will donate a "Henshall rod" and a "Henshall reel," and from Mr. B. C. Milam, who will donate a Frankfort black bass reel, latest pattern: Others will, I am sure, respond at my request.

Yours very truly,

J. A. HENSHALL.

Mr. Endicott thought the plan of Dr. Henshall was judicious. Two years ago the Doctor thought that a one-ounce sinker would represent the minnow, and that was the weight used in light striped bass casting, and, therefore, there would be a sameness between the two styles. Now that Dr. Henshall has changed his views as to the weight of the minnow, or its representative, he favored a black bass class, and moved that at the proper time a committee be appointed to draw rules for this class. Carried.

Mr. Van Cleef asked what was the actual weight of the minnow used for casting for black bass. Mr. Mather replied that in his experience such minnows would vary from thirty to fifty to the pound.

The Chairman then appointed the following sub-committees:

Grounds—M. B. Brown, J. L. Vallotton, J. Geddes, T. Magoun.

Reception—Hon. R. B. Roosevelt, Isaac Townsend, L. W. Winchester, L. Wright, Rev. H. L. Ziegenfuss.

Trout Casting—J. Benkard, C. Van Brunt, J. S. Van Cleef, H. Weston, C. H. Mallory, W. B. Lord.

Heavy Bass Casting—J. L. Vallotton, S. M. Blatchford, H. P. McGown, F. Endicott.

Light Bass Casting—E. G. Blackford, Dr. J. C. Kenworthy, Prof. A. M. Mayer, F. Endicott.

Salmon Casting—J. C. McAndrew, C. Van Brunt, C. B. Evarts, D. W. Cross.

Black Bass Casting—Dr. J. A. Henshall, Dr. E. Bradley, W. C. Harris, Dr. J. C. Kenworthy.

Prizes—F. Endicott, F. Mather, H. P. McGown.

Programme—E. G. Blackford, F. Mather, M. B. Brown.

It was decided to adopt Rules 1 to 10 of last year's programme and leave the others to the special committees. The meeting then adjourned to meet on Aug. 4, when it is expected that the sub committees will report.

PHILADELPHIA NOTES.

SOFT shell crabs have never been more plentiful than at present. Quantities of them are being sent to our market from the near New Jersey bays, and are attracting a more than usual number of weakfish into these waters. This, as well as an absence of bluefish thus far, has made angling for weakfish excellent.

White catfish have begun to run from the Delaware River up into the tributaries of this stream. Just now is about the ending of their spawning season and their flesh is not in as good order for the table as it will be next month. At Betterton white perch have begun to bite, but the fish are running small. It is not until the middle of August or first of September that the large perch at this famous fishing ground are taken.

Some large black bass have been caught in the Susquehanna River this month, a short distance above the bridge which crosses the stream from Perryville to Havre de Grace. I believe Charley Vogel, of Philadelphia, was the first to discover that the black bass congregated in any great numbers at this section of the Susquehanna. He at once began fishing for them and being very successful in taking large fish, has followed it up every year since. But few black bass have been caught in the Schuylkill near this city this season. Sawmont Dam, about the nearest ground where any success could be had, bids fair hereafter to be the center of sculling interest, as the river at this point offers a grand course for racing and was selected as a better site for the late Collegiate controversy, than the old one on the Schuylkill at Rockland and Laurel Hill. So it may be expected that the patient bass fishermen after this will move up the river further if he does not wish to be disturbed.

Perkiomen Creek, where it empties into the Schuylkill, will now be more frequently visited than formerly by bass fishermen, and I believe it to be the most likely ground near Philadelphia that can be reached and returned from in one day and find a day's fishing.

The Schuylkill is very muddy since the rain of the 26th, the accumulated dust of over a fortnight has been washed into the stream, rendering all attempts at bass fishing, for some time to come, useless. HOMO.

JUNE 28.

GONE TO THE BASS ELYSIUM.

AN "elysium of perennial bass" is good. The time was when to the editorial fancy the seeker for that land of the blessed had for his incentive houris, promised, in prophecy and song, dwellers in cloud land, where the dancers were never weary and the harp was never silent. Later, the dream of the sanctum sought its realization and looked for the locus of the myth in the vicinity of Hoboken. But now a revelation has come to the man of the pen; he has found a new elysium, its reward is "perennial bass," and straightway, with all the liberality of the craft, he proceeds to give it away; it is in Canada, "somewhere in the woods up there." Truthful James says

> —— "that it is not a proper plan
> For any editorial gent to whale his brother man,
> And if a fellow don't agree with his peculiar whim,
> To lay for that same feller for to put a head on him."

Now that the thing is out, we drop our traps for a moment and closing our ears to the wail of *M. "perennial" dolomieu*, crying to us from far off Frontenac to come and take them in out of the wet, turn to say good-bye to FOREST AND STREAM. You "hope we will have good luck," thanks! Yes, "Truthful James," and "Wawayanda" and the "Reformer"—the latter so called by reason of his bearing the name of Luther—"are going." No, "the choice of hunting rifles" and "the performance of shotguns" don't interest us and probably won't, unless the persistence of the Reformer in using worms for bait may induce us to take some stock in the latter. "Shall you send us that?"—No, thanks, the Reformer raises an objection, something about "duty" or "custom," which he don't just get hold of, although Truthful James observes that "custom cannot stale its infinite variety;" perhaps we can get hold of it easier in Canada—the objection we mean—when the Reformer has had the time to explain.

Oh yes, certainly we shall "keep an eye out for 'babbling spring brooks' and 'clear cool spring water,'" for we are informed that in these Canada surpasses Michigan, at least that portion of the State which lies along the fiery path of the Kingfishers. There, Truthful James says:

> "The wells are empty and choked with sand,
> And the springs have perished from the land."

It is this wanton destruction by sportsmen that has so prejudiced the rural resident against us as a class.

No such things ever happened on the Bigosh; that beautiful stream rolls its burden, as of old, undiminished to the lake, and yet a tired angler camped and gazed for weeks on

its waters with never a temptation to impair in the least its facilities for navigation.

But we must be off. Cross hands with Truthful James and us, lay the same with your blessing on the head of the Reformer, and be assured that whatever flotsam may drift under our canvas or beach itself on the borders of our camp-fire, whether the same be catch, strike or bite; that whatever of inspiration may come from the pines, the balsams or the hemlocks, these the lone campers will send you with their greeting—*Auf Wiedersehen.*

WAWAYANDA.

BASS IN LAKE MADISON.

ON Monday last, E. L. Healy of this place caught at Lake Madison a black bass that weighed seven and one-half pounds. On the same day, Mrs. Geo. A. Clark, of Mankato, took one "in out of the wet" that "kicked the beam" at exactly seven pounds. This is no "fisherman's guess" as to the weight of the fish, but the true weight as indicated by a pocket scale carried by one of our party. I think I am justified in calling them a couple of fine fish.

Lake Madison is located in Blue Earth county, Minn., and is about ten miles from the city of Mankato. It is reached by way of the Chicago & Northwestern Railroad to Eagle Lake station, and from thence overland four miles. It is one of the most attractive sheets of water in the Northwest, having about thirty miles of shore line, with high banks heavily timbered down to the water's edge, and a number of high points projecting into the lake. On one of these is situated the Point Pleasant House, kept by Capt. John Foster, an old Mississippi steamboat captain, well-known to a large portion of the traveling public of the Northwest, who spares no pains to make it pleasant for visitors at the lake.

As a fishing ground for bass it has few equals in Minnesota. Thirty bass, weighing one hundred and sixteen pounds, were the best afternoon's catch of two of our party, during our recent visit. If your readers in the Northwest want a few days' splendid sport in a delightful locality, let them make a trip to Lake Madison. C. B. T.

MARSHALL, Minn., June 25, 1884.

PROTECTION OF COAST FISHERIES.

THE following is a summary of the amended bill, entitled "A Bill for the Protection of Fisheries on the Atlantic Coast," reported by Hon. E. G. Lapham, of New York, in the Senate of the United States:

Be it enacted by the Senate and House of Representatives of the United States in Congress assembled:

Section 1. That it shall not be lawful for any person or persons, by day or night, to put, place, haul, draw, or in any manner use any purse net, pound, fyke, weir or other appliance for the capture of menhaden or mackerel upon the high seas within three miles of the Atlantic coast, or in any arm of the sea, river, etc., prior to the 1st of June, south of a line drawn easterly from the southern cape of Chesapeake Bay, and prior to the 1st of July north of said line.

Sec. 2 prohibits the capture of any fish prior to those dates, and in the places described, for the manufacture of oil or fertilizing material.

Sec. 3 makes persons convicted liable to a penalty of not less than ten nor more than one thousand dollars, which shall go to the U. S. Commissioner of Fish and Fisheries.

Sec. 4. Any boat, nets, or apparatus used, hired or loaned, to violate this act, shall be forfeited, confiscated, and sold.

Sec. 5 provides that such boats, nets, etc., shall be liable for the penalty imposed by Section 3.

Sec. 6. All nets in menhaden or mackerel fisheries shall have meshes not less than one and a half inches, bar measure, under penalty of not less than ten nor more than one hundred dollars for each offense.

THEY FISHED FOR THE POT.—*Editor Forest and Stream:* I had the novel experience last week of fishing a pool that had never been fished, bringing home a basket of four dozen as the result of a little over an hour's work with the rod. The largest trout weighed a pound and a quarter and the smallest six ounces. I was at the Lake House in Point de Bute, New Brunswick, and a friend offering me a seat in his boat we proceeded down the Portage Lake to Beach Point, when by dint of dragging and pushing the boat for nearly a mile through a channel almost grown up with alders and "hard-hacks," we reached Duck Lake run, at the point sought. Our tackle consisted of a couple of mackerel hooks suspended from alder poles by coarse linen lines, with sheet lead for sinkers and angle worms as thick as one's little finger for bait. Being a guest, I refrained from criticising the outfit, and I was glad afterward, for my companion knew his business, and we had no more than got the boat steadied after dropping anchor, before he gave a seventeen-ounce trout what he called the "parliamentary yank," and landed him in the boat unaided by gaff or landing net, with the mackerel hook imbedded in a hold strong enough to lift a shad. The trout were very unsophisticated and unused to worm diet, and each time the hook was lowered it seemed to be a race among them to see who would get on first, with the odds in favor of the largest. I am free to admit it was not very scientific work, but then I never took much stock in fishing as a fine art, and the weight of the "pot" was a great satisfaction. The supply seemed to be unlimited.—B.

LARGE LAKE TROUT.—The Montreal *Witness* says: "Lately Capt. W. H. McLeod, who is running one of the fishing boats belonging to Mr. D. McLeod, an extensive fish dealer in Southampton, caught an immense salmon trout, weighing 80 pounds, measuring from the point of its nose to the end of its tail 5 feet 2 inches, and around the thickest part of its body 34 inches. The head was 10 inches in length, and the width of the tail, from point to point, was 12 inches. This is the largest fish of that species ever caught in that section. The monster was packed in ice and consigned to Mr. Furey, of Woodstock, where it is now held for exhibition.

LARGE TROUT.—New London, Conn., June 21.—Strolling through the town, where I am a stranger, I noticed in the store of W. S. Chappell two platters, each containing a large trout. On entering, I learned that they were three pounders, and were caught by Mr. F. H. Chappell, who also had a larger one of eight and three-quarter pounds on another platter, which he was showing to some friends. The fish was twenty-seven inches long, and was caught by Mr. Chappell off Metallic Point, lower Richardson Lake, Me., with a fly. The fish was very shapely for one so large.—POKE-O-MOONSHINE.

BASS IN LAKE ONTARIO.—Oswego, N. Y., June 27.—Now that the season is fairly open—for in this country we don't count May 20, but wait until the ice breaks up—I may be permitted to tell you of our bass catches in Lake Ontario within ten miles of the mouth of the famed Oswego. For at least three weeks, at Lake View, Pleasant Point, Mexico Point, Texas and Ford's Shoals, points both east and west from the city along the lake shore, the bass fishing has been perfect; and by perfect I mean this, that two fishermen with a boat, from 3 P. M. until dark, could catch from ten to thirty small-mouth black bass, none of them less than a pound in weight and some of them tipping the beam at from two and a half to three pounds, with an occasional big-mouth thrown in that might go even four pounds. Catches have ranged from eight fish weighing thirteen pounds, to thirty-seven fish weighing over eighty pounds, in an afternoon. This, too, when ten or twelve parties were fishing, each with a large basketful at night, and there are more left. We do our fishing in the lake at this season with trolling, minnow and fly. Later in the season fly alone. Night before last a bass that weighed four pounds was caught in the river within twenty rods of the heart of the city.—LEX.

A TRIP POSTPONED.—Our well-known correspondent, "Piseco" (Capt. L. A. Beardslee, of the Navy), had a trout fishing trip to Maine planned for June. Messrs. Cheney, Wells, and others had given him directions just where to go, and if we are not mistaken were going with him. Routes were studied up, tackle prepared, all was ready, and "Piseco" impatiently waited for his expected leave of absence. A document finally came from the Secretary of the Navy, but instead of a leave of absence it was an assignment to the command of the U. S. S. Powhatan, and instead of taking in some of those big Maine trout, "Piseco" is now on his way to the European squadron.

STATE FOREST PRESERVATION.—Albany, N. Y., June 28.—Comptroller Chapin has appointed, to investigate and report upon the system of forest preservation, Prof. Charles S. Sargent, of Harvard University; William A. Poucher, of Oswego; D. Willis James, of New York, and Edward M. Shepard, of Brooklyn. The appointees are to serve without compensation, as their expenses are likely to consume nearly all of the appropriation.

MARYLAND.—Brady's, Md., June 23.—The open season for bass on the Upper Potomac began June 1, but the catch is very light, owing, I believe, to the negligence and delay of the State Fish Commissioners in erecting ladders on Dams Nos. 5, 6 and 7. Very few fish over one pound are taken above No. 7, at Cumberland. Woodcock are scarce, but there is a splendid prospect for quail this fall.—4-11-44.

PITTSFIELD, Mass., June 30.—The Rod and Gun Club held a meeting Saturday evening and appointed committees to see about their encampment at Onota Lake. They expect to be in camp some weeks. They will have notices printed and sent about the county notifying the people that they must not fish for trout after Sept. 1 this year, which is a month earlier than in previous years.

NOVEL BILL OF FARE.—The Lake View House, Elk Rapids, Mich., prints on its bill of fare a record of the fish caught in the vicinity. The bill for June 22 sums up the season's catch to date as 778 trout and 166 bass. They were not all taken by hook and line; some were netted.

Fishculture.

BLACK BASS IN MAINE.

[A paper read before the American Fishcultural Association.]

BY GEO. SHEPARD PAGE.

IT is often difficult to determine the exact date, or obtain reliable information as to the original introduction of a new species of food fish into a river or lake, and particularly to ascertain the facts relative to the stocking of the water of a State for the first time. This is important, not only that the agents in the work shall be placed on record, but chiefly that we may know definitely the time required to disseminate fish over a large territory in such numbers that the people can rely upon them for food and sport. Experience with the black bass in Maine is one of the most pertinent and effective illustrations of the value of such labor.

In August, 1869, accompanied by four friends, I left New York by Hudson River afternoon steamer for Newburgh. Arriving there about 7 P. M., my transportation box was conveyed to the small private pond of Mr. Walter Brown. At daylight the next morning we literally surrounded the pond and began casting the fly. In an hour, thirty-five small-mouthed bass were placed in the box, and at 7 A. M. the steamer Mary Powell started with us for the metropolis. Arriving there at 11 A. M., the box containing forty gallons of water and thirty-five bass from one-quarter pound to a pound weight, was taken to the dock of the Fall River line, and a stream of Croton water turned on until 5 P. M. Arrangements were made with the night watchman to work the air pump at intervals. Arriving in Boston an express wagon conveyed the box to the Eastern Railroad, and during the journey at intervals of fifteen minutes I aerated the water by the use of the air pump. At 3 P. M. the train reached Monmouth in Maine, about fifty miles northeast of Portland. Very near the railroad station is Cochnewagn Pond. I selected twelve bass and quickly transferred them to the pond. The train moved on and a few minutes later arrived at Winthrop. A wagon was hired and the box taken to East Winthrop, four miles distant, and twenty-one bass were liberated at the head water of the famous Cobosseecontee Pond, the largest of a chain of lakes thirty miles in length. Placing the remaining pair of bass in a three-gallon pail, I started by team for Phillips, Franklin county, forty miles away. On the route one of them died. The remarkable vitality of the bass is exhibited in a strong light in view of the mode of capture, long and difficult transportation and mid-summer temperature.

The following October Mr. Charles G. Atkins, then Commissioner of Fisheries of Maine, procuring my transportation box, took thirty-nine bass from Mr. Brown's pond, which he placed in Duck Pond, near Portland, Me. So far as I know these seventy-four were the first and only black bass deposited in Maine waters. Fourteen years have elapsed, mark the gratifying results: The report of Hon. Henry O. Stanley, Commissioner of Fisheries for Maine for 1881, contains the following: "The black bass, owing to its very game qualities, continues to be a favorite fish with anglers, and applications for introduction are received beyond the power of the Commissioners to gratify. It should never be introduced into any waters where there are trout, or from whence it can gain access to trout streams. For ponds, whose stock of trout has been exhausted by poachers, who murder the fish in their spawning beds, and where only yellow perch, bream, and pickerel are left, it is invaluable. Trip Pond, in Minot, Gardiner's Pond, in Wiscasset; Gun Point Ice Company Pond, in Harpswell; Hosmer Pond, in Rockport, Keazer's Heald, and Cushman ponds in Lovell, and Little Pushaw, in Corinth, have all been stocked with bass this past year."

Messrs. E. M. Stillwell and Hon. H. O. Stanley, in the report for 1883, report as follows: "The black bass is still growing in popular favor. We have had more orders this year for stocking ponds than in our power to fill. The great success met with at Pushaw Lake; the number and size of the fish taken, some turning the scales at four and one-half pounds, tend to popularize fish protection and fish planting; the increase in the product of fish, the result of the suppression of netting, all tended to produce a great and beneficial change in the public mind, giving firm and even enthusiastic support where hitherto we have been met by active opposition. Newport and Glenborn can now boast of two of the most beautiful and productive lakes in the State, destined in the future to become popular places of summer resort for devotees of boating and angling, and where pretty cottage residences may be built for family homes at but trifling cost, and where easy access to telegraph and railroad would render their occupants scarcely conscious of absence from city comforts. Cobosseecontee, Snow and Belgrade lakes are places of marked beauty and healthfulness, easy of access and where facilities for boating and angling are unsurpassed. Homes for hundreds whose lives are dependent upon country air and exercise can be made in cottage and tent, while the expense of the more fashionable places of resort bars them from all but those of large means. We often wonder that our city residents do not appreciate at how small a cost a pretty summer cottage can be built upon the shore of any of these beautiful lakes, abounding in fish, with health and exercise, and freedom from all the cares of city life."

In a letter dated Dixfield, Me., April 27, 1884, Mr. Stanley writes: "Yours of the 24th received. With regard to black bass, I know we have them here in great abundance, the number of ponds we have stocked (all pickerel ponds) I think will reach to the hundreds. Wherever you put half a dozen, they are sure to take and will be heard from in two or three years. I have taken bass of two and one-half pounds in a pond that had only been stocked two years, and with young fry, so they could not be over two and one-half years old. There has been a great demand for them in our State, and in many pond there is good bass fishing where there was none whatever before. I think they are a fish that cannot be thinned out by fishing with hook and line. I have met with the best success with the fly from dusk till 10 P. M. at night, fishing close in shore in very shoal water, have caught large fish when it was so dark I could not tell, casting from a boat, whether my fly struck on shore or in the water, and only knew I struck a fish by feeling the tug or hearing the splash. The Winthrop Ponds, Cobosseecontee, one of the ponds you stocked, Lake Maranocook and in all that chain of lakes, is good. I have taken in one afternoon in Cobosseecontee, sixty pounds of from two to three and a half pounds each. There is also fine fishing in Belgrade ponds, Pushaw Pond, Bangor, and in scores of others. I mention these as they are easy of access by rail, and good accommodation can be had at hotels and farm houses, and at low rates. Also pleasant places to camp. The inhabitants are always glad to welcome sportsmen and visitors, and accommodate them with boats and information at low rates. I think the black bass are a great benefit to Maine."

LOBSTER PROTECTION.

AT last a strong step has been taken in the right direction toward enforcing what is known as the ten-inch lobster law here. The statutes of Massachusetts provide that "Whoever sells or offers for sale, or has in his possession with intent to sell, either directly or indirectly, a lobster less than ten and a half inches in length, measuring from one extreme of the body extended to the other, exclusive of claws or feelers, shall forfeit five dollars for every such lobster, and in all prosecutions under this section the possession of any lobster not of the required length shall be *prima facie* evidence to convict." Notwithstanding the fact that the law would appear to be strong enough, yet it has been constantly broken, and it has been extremely difficult to secure the conviction of guilty parties. The lobsters under size have generally been left out of sight, however, and used to supply other retail markets.

But the lobster trade itself has at last become alarmed at the general destruction of this valuable crustacean. Commissioner E. M. Stillwell, of Maine, when here a year ago, tried to induce some concert of action with his State toward protection of the lobster, but did not succeed in any marked degree. Messrs. John Fottler, Walter M. Brackett, F. R. Shattuck, and several other members of the Fish and Game Protective Association here have taken great interest in the subject and tried to see that the law was enforced, but their efforts have been sustained by no State force until now.

An informal meeting of the association was called on Wednesday evening, when several men from the lobster trade were present and pledged both money and influence to aid in enforcing the lobster law. Commissioner of Internal Fisheries E. A. Brackett, has also obtained promise from State authorities of all the aid he may require in the way of detectives and officers to enforce the law. It is now believed by the friends of lobster protection that matters are in a fair way to make those who have been in the habit of supply other markets with lobsters under size sick of the business. They hope that the day has gone by when a barrel of under-sized lobsters can easily be hustled out of sight before an officer can be obtained. Much of the work will probably be done by detectives.

SPECIAL.

BOSTON, June 20.

SALMON FOR THE ANDROSCOGGINS.

THE Fish Commissioners of New Hampshire have awarded 10,000 salmon fry to Umbagog Lake, the lowest of the Androscoggin chain, and a part of which is in Maine and a part in the first-mentioned State. Last Monday, Fish Commissioner E. B. Hodge left Plymouth in the morning with the 10,000 young fry in cans. At Groveton Junction he missed the Grand Trunk train, necessitating a delay of three hours, in consequence of which he did not reach North Stratford till 10:40 o'clock. Here he was met by Capt. Charles A. J. Farrar, of steamboat fame on the Androscoggin lakes. The Captain had a team ready, and after procuring a supply of ice to regulate the temperature of the water in the cans, they started with the precious freight of 10,000 living fish for the long drive of nearly twenty miles to Errol Dam, at the foot of the Umbagog.

Errol was reached without accident at about 5 o'clock A. M., and it was found that the fish had stood the journey remarkably well. Only a few were dead, which were at once removed from the cans. By little steamer the living fry were taken up to Sunday Cove at the head of the lake, and thence three miles by buckboard up the Rapid River, which flows five miles from the Middle Dam, Richardson Lake, to Umbagog. Into a little stream, which flows into the river near the camps of the Oxford Club, a part of the fish were put, and the balance into the river itself. Within ten minutes after the fish were liberated from the cans they might be seen feeding and moving about as quietly as though they had not been hatched and planted for the future delectation of the angler. The planting of these fish is regarded as successful, since out of the whole 10,000 not more than 500 died from transportation.

To Prof. Hodge much credit is due. He has taken great pains with his charge, and in his efforts for successful transportation he was seconded by Capt. Farrar. Both gentlemen are pleased at being able to plant nearly 10,000 young salmon in the headwaters of this, once one of the most famous trout

lakes of the Androscoggin chain. But the wise foolishness which hung about fishculture twenty-five or thirty years ago put pickerel into this lake. Their shark-like propensities for destroying other fish long ago completely used up the small trout, leaving only the "old settlers," too big to be eaten. But, as is usually the case with pickerel, they long ago began to prey upon the young of their own species, and are believed to be fast disappearing from the lake.

Under such circumstances it has been deemed expedient to try landlocked salmon in those waters. It is believed by the Maine and New Hampshire Commissioners, and others who have made the subject a study, that the salmon small fry remain in the streams where they are planted till they are large enough to take care of themselves as against pickerel and other enemies found in the lake below. When old enough, they descend to the lake, as do the sea salmon to the sea, always returning at the breeding season to deposit their eggs out of danger in the very waters where the present fish themselves grew up. If such be the true theory, and all the discoveries of the past dozen years point that way, and fish planting is kept up, we, good readers of the FOREST AND STREAM, may yet find noble sport with the landlockers in the Umbagog.

SPECIAL.

BOSTON.

HATCHING SHAD IN SPRING WATER.—It has always been thought by fishculturists that river water is necessary to the development of shad eggs, but experiment at Cold Spring Harbor has proved that this is not only not the case, but that spring water is best. Mr. Mather, the Superintendent of the hatchery there, asked the United States Fish Commissioners for a few hundred eggs to test in spring water. Eighty thousand shad eggs from the Potomac River were forwarded to him and they were placed in the McDonald hatching jars, and hatched with not only a slight percentage of loss but without the development of fungus on the dead eggs. The fry, some 78,000, were placed in the Nissequogue River, at Smithtown, Long Island. The advantage that may be derived from this experiment is, that in future the distribution of shad eggs will probably be from the central hatchery at Washington to all points where there are hatcheries, instead of sending the fish after hatching and paying charges on the water that they require, an item of importance when it is considered that an entire car with 2,000,000 shad fry is often sent to States as distant as California and Texas.—*Long Islander.*

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

W. D. W.—See our game columns for moose hunting grounds.

C. W. C., Woodside, N. Y.—The New York law permits the collection of song birds for scientific purposes.

A READER.—Do shad take the fly, and if so at what season of year and where are they caught? Ans. Shad are taken with the fly at Holyoke, Mass., from July 1 to August.

NOVICE, New York.—1. What hook and size is best for worm fishing for brook trout in streams where the fish seldom attain one pound weight? 2. When split shot has been applied to the gut and it is not necessary to have it on any more, how can the same be removed best without injury to the gut? Ans. 1. Try a Sproat hook, No. 1 or 2, the latter is the smaller. 2. Open the shot gently with a pocket knife. If the gut is injured, cut it and wet the ends and tie it.

C. C. W., Warren County, N. Y.—I wish to ask you some questions concerning the black bass in Brant Lake, this county. I say you cannot catch bass while they are spawning. The bass have beds within ten feet of my shore. Can I not protect, for some distance, the waters around my land? Hounds from below and other places, come here and troll with live bait, over the beds, and bass will always take the minnow. Can I only prosecute for trespass, if I can protect waters about my own land, or will I have the only remedy of informing on these fishermen (God save the mark!) to the game constable? Some people here say the law is up June 1; I say not. The bass are now, at this writing, spawning all around my shore. I am sure one old rascal hooked a bass within twenty feet of my shore from the beds. Last year I was away at this time of the year, and so was not able to locate the beds, and only last week have I been able to do so this year, there having been so many storms of wind and rain this season. Ans. The law of New York allows black bass fishing from June 1 to Jan. 1, except in the following waters: Lake Mahopac or Dutchess county, July 1: Lake George, July 20; Schroon Lake or river, Paradox Lake, in the counties of Essex or Warren, July 1. You can forbid persons to enter your premises, and bring action for trespass, unless it could be proven that Brant Lake is part of the Schroon River, into which it empties.

New Publications.

A BOOKE OF FISHING WITH HOOKE AND LINE.—This rare old work, by Leonard Mascall, 1590, has been reprinted, with a preface, by Thomas Satchell, 19 Tavistock street, London. It is a very curious work, and contains much of interest to anglers as well as fishculturists. We find so many quaint things in it that we propose to make a few extracts from the book in a future number. It is well printed, and the illustrations are *fac-similes* of the original.

WHAT THEY SAY OF "WOODCRAFT."

A DELIGHTFUL little work has just been issued by the Forest and Stream Publishing Company, of this city. It is entitled "Woodcraft," and is written by one who assumes the pseudonym "Nessmuk." In just less than 150 pages the author inducts us into many of the secrets of a "craft" which is certainly as wonderful in its way as many that are practiced among the city's brick and stone. He reveals to us all that can be done with knapsack, hatchet, knives, tin ware, rods, fishing tackle and ditty-bag. He emphasizes the difference between roughing it and smoothing it, and tells how to make both camps and camp-fires. He explains the tactics of fishing, either with or without flies, and devotes two full chapters to the very important subject of cooking. The book is written seriously and with a purpose, yet there is nothing heavy in the manner in which the themes are handled. It is the peculiarity of an author who is full of his subject that he remains full after having exhausted himself without exhausting the reader. This is eminently true of "Nessmuk."—*New York Evening Telegram.*

$290,000 was paid last year for claims under the life policies of the Travelers, of Hartford, Conn., and $1,154,000 to life and accident claimants together.—*Adv.*

Oct. 21, 22, 23 and 24.—Non-sporting Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Charles Lincoln, Superintendent.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1319.** Volume I., bound in cloth, sent postpaid, $1.50.

POINTERS AT THE NEW YORK SHOW.

Editor Forest and Stream:

Now that the numerous members of the W.K.C. have so gracefully retired from the controversy, I will be brief in my reply to them. Let me first ask you to correct two slight errors in my last letter. You credit me with saying Sensation won second prize at a little Saturday afternoon show held at Oswestry, England. The dog won third prize on that occasion and therefore took the prize money—half a crown (sixty cents). The letter from an English breeder relating to Bang Bang should read as follows: "Bang Bang did win first prize, but the class was a wretchedly bad one. The opinion here is that the American who paid £50 for him got his fingers well bitten. The dog has another fault besides those named by you." Mr. Cornell states that "every insinuation" and "direct accusation" conveyed in my "intemperate" letter are false. In the first place, there were no insinuations in that letter, and in the second, every statement contained therein is as true as steel, and I am prepared to prove such to be the case. My letter contained nothing but hard facts—the truth, mere denial of which is no argument, and only proves the inability of Mr. Cornell and his club to reply. There is still a chance for Mr. Cornell to redeem himself. I hold proof that the W.K.C. desired to purchase Beaufort for $500. Mr. Nixon refused to let him go at the money, and I suppose it is only human nature that Mr. Cornell and his club should feel disappointed and grieved when they saw the dog in the hands of a pointer breeder within a few miles from their own kennels. If the attempt has been to use Beaufort up, let Mr. Cornell admit it like a man. The dog still lives, and he never stood so high in the opinion of breeders as he stands to-day. It is not sufficient reason to bury in oblivion the grandest dog of his day, simply because his owner is not popular with a few inexperienced grumblers, and has the misfortune to be one of Her Britannic Majesty's humble subjects. Our aim should be to improve the beautiful pointer, and not to sacrifice his good looks on account of petty jealousy or envy.

I have little to say to Messrs. Ingersoll and Grant, both members of the W.K.C. One says something about my character and temper, but has omitted to allude to my appetite or the cut of my clothes. The other alludes to turkeys, pigeons and circuses. Really, Mr. Editor, I thought the discussion was of the merits and demerits of certain dogs, and if so I do not propose to discuss either poultry or anything else. Too many fouls have already been introduced into the controversy.

Mr. Elliott Smith overrates the performances of Bang Bang. The dog was first in England in a very poor class, and second at Cleveland. I pass over the prize won at New York. Mr. Smith must advance some substantial argument to show the advisability of breeding to a little dog of Bang Bang's type, that gets black and white puppies; so far, he has failed to do it. This gentleman wishes it understood that when he and Mr. Cornell offered $350 for Beaufort, they had not made a thorough examination of the dog. Two gentlemen, therefore, who consider themselves judges, offered $350 for a dog without examining him. That is funny. A little later they desired to pay $500 (without any further examination), which seems ridiculous. Who examined Bang Bang before he was purchased, I beg respectfully to ask? Come, Mr. Smith, be frank. You and Mr. Cornell took a great fancy for Beaufort, and pronounced him the best pointer you had ever seen. You did not care to buy a dog on your own judgment, and so you called in the assistance of a gentleman well known in connection with pointers, a man of undisputed integrity. He told you to buy Beaufort, because in his opinion he was the grandest dog ever seen—would be a credit to you, and raise the standard of your kennel. Is this not the truth and nothing but the truth? Mr. Nixon stopped the sale of the dog and refused to sell at any price. This is why you made no further advance, and it is only since I became the lucky owner of the dog that you discovered that "his hindlegs are crooked." These are undeniable facts, and the public should know them. Further allusion to the matter is unnecessary.

Mr. Aldrich (who admits he is employed by the W.K.C.) considers Beaufort a "good-looking big dog," but not quite what he wants. I cannot stop to argue with Mr. Aldrich, for one of his best friends tells me he knows nothing about the points of a dog. One thing I will say, that is, Mr. Tallman, I believe, has pronounced Beaufort the best dog ever seen. Mr. Martin, manager for Mr. Goodsell, told me the same thing some time ago, and Mr. Mitchell wrote a gentleman in New York City, to call on me, as I could show him the grandest pointer that ever stood on four legs. These gentlemen are not interested, and it is quite probable any one of them is as good a judge as Mr. T. Aldrich.

It is a little late in the day for Mr. Tracy to come forward as a judge of dogs, and his advent was by no means a brilliant one, nevertheless I will give him a short reply, but I wish it distinctly understood that I do not intend to discuss dogs with this gentleman, not at least until he has shown that he has owned and bred good ones. Mr. Tracy says that I seem to assume that the judges of public events have hitherto been on the average a lot of dolts. What has this got to do with my criticism of the "Pointers at New York." I assume nothing of the kind, but on the contrary I have a great personal regard for some judges, one of whom is Major Taylor. I freely admit that I have seen dolts in the judging ring, and it is about time they found the modesty, or regard for the feelings of others to stand out. Mr. Tracy next states that I have denounced Croxteth, Sensation, and the setter Thunder, and continues, "all these have been publicly shown to be very superior field dogs." By your courtesy, Mr. Editor, I will reply, but are we not getting a little wide of the question under discussion? Croxteth I pass over, my opinion of him is well known, but he is a much better dog than Meteor. I do not say, neither did I ever say that Sensation was not a fairly good field dog. I do say he was never a show dog, and I repeat that no judge would pay $75 for him when he was for sale at that price. I did not consider him a good-looking dog the first time I saw him and I do not consider him a good-looking dog now. I claim to have a conscience. I deny that Thunder was ever a "superior field dog," or indeed a field dog at all. His record (divided stakes at Pennsylvania Field Trials with four or five others—no birds) is the only proof of his superior public field form. No dog formed as Thunder is, ever was, or ever will be, a field dog. I had the pleasure of meeting the breeder of Thunder not long ago, and in justice to myself and for Mr. Tracy's edification, I wish to say right here that he not only indorsed what I wrote in the public papers twelve months ago, but added that "Thunder is an idiot in the field." Rest assured, Mr. Tracy, that when I write anything in a public paper about dogs, I am prepared, sooner or later, to verify my statements. Even our new judge could not see that Thunder's legs are crooked, and so he painted them straight. I quite agree with Mr. Tracy that the qualities of some of these dogs have been "privately tested" by so many persons as to have become "notorious." ("Experience and fact say they must be well formed for their work, else they could not have performed it.") I once owned a black and tan terrier bitch that would find birds and point them, a fact which never made her able to win a prize in a class for pointers. A black setter distinguished himself at some recent field trial. That is no reason why he should win on the bench. I have seen a Dalmatian do good work in the field, which does not say that any "qualified judge" would give him a prize in a pointer class. No, no, Mr. Tracy, what we want are good-looking good dogs; such as Hamlet, Rap, Wagg, Bang, Bow Bells, my own dog Don II. and many others. Such dogs are not bred every day. Neither are they the results of breeding at random from inferior sires crossed on the most unsuitable dams.

If Mr. Tracy judged the dogs at New York, as he says he did, regardless of bench show standards, every exhibitor who showed under him (I did not and never will) can legally claim his entrance money, for one of the rules stated that the dogs were to be judged by the standard laid down by Stonehenge in "Dogs of the British Islands." I am glad it is now admitted the dogs were not judged after any recognized standard. Who ever thought that they were?

Mr. Tracy alludes to an avalanche of personalities. The only personal remarks so far have come from the W. K. C. through Messrs. Cornell and Ingersoll; Mr. Tracy contents himself with insinuations. I hate personal allusions in a discussion of this kind, but I do like facts—hard as granite—and those who cannot face the music had better not enter into a discussion of the relative merits of dogs with your humble servant.

CHAS. H. MASON.

TOMPKINSVILLE, S. I., June 28, 1884.

Editor Forest and Stream:

I was very much surprised to find a protest in your issue of June 19, signed by forty, said to be exhibitors, a number of which I fail to find in the catalogue, and also that of T. B. Dorsey, as he declared in your issue of June 5 that he had never seen Meteor and would not pretend to say whether Mr. Sterling was wrong or not. It looks rather hard when men like this, who claim they were not there, lend their name to protest the judgment.

T. M. ALDRICH.

A FOX HUNT ON THE ROANOKE.

I HAD on the 17th of March just passed one of the most laborious yet electrifying day's sport in the field that huntsman ever had. The morning was well suited for a fox chase, and after an early breakfast I moved up the Roanoke, but keeping some two miles north of that stream, on the ridge between it and the Maherrin River, to a point designated as a meet by Basset Rawlings, Major Mason and William Valentine, of Virginia. We all were in proper time, meeting exactly at the appointed hour. I had all my young Byron bitches, and only four old trained ones. Betty was not carried out, she having enough to do at home in caring for her four puppies. By the by, they are double Byron and a very fine sample of the stock, and were sold long in advance of their whelping to gentlemen at the North. Rawlings had his pack (mostly Byron), old, true and well trained, with two black and tan puppies added. The usual salutation of men and hounds then took place, for on the meeting of two packs the ceremony of recognition invariably follows before they move off to hunt. Every huntsman knows this, and usually awaits its termination before he attempts to encourage them onward. So did we on this occasion.

When the horn was sounded for a forward move, off dashed Rawlings's Stonewall, a fine black tan, and as full of hunt and music as hound ever was, followed in close proximity by his Juno, Bill, Dixie and Screamer, the full litter sister of Tom Wilkins, and by the by the pride of his pack. My Byron puppies were fully alive to the occasion, and in beautiful style would earnestly come forward, smelling every stump in the line of our route. Screamer soon struck a trail and Rawlings's pack flew to her summons, evincing an eagerness which a true hound invariably excites. Rawlings's hounds heed and hark better than most hounds. In a very short while the cry was swollen to great dimensions, for my pack too had participated in the rush to Screamer. The trail went due west for two miles or more, and over fields and through thick briered branches. Beyond these, in a small pine thicket, a place not at all inviting as a retreat for security, the fox dashed off, followed by a thundering sound of earnest pursuers. The run was due west and well contested for an hour, when a flock of sheep interrupted it. The break continued for twenty minutes. It was in a pasture clear of shrubs and briers, and the proper place to witness the sagacity of the packs. This we enjoyed to its full extent, we remaining still all the while, with hearts thumping with unpleasant violence and eyes dancing in every way, directed by the rapid dashing around of the hounds. The circling was by the entire pack at first, sweeping around in a small circle, which was gradually and systematically enlarged.

Some three of these circles were made and no false summons given. One of my Byron pups was first to quit the column. She was fortunate in her move, and gave a loud and excited cry for aid. That is Sally; she is perfectly reliable. Hark! I hallowed; but that was not necessary. Screamer, Stonewall and Ringwood (all Rawlings's) were with her in a second—the pack tumbling in from every point. The run was resumed, but its character had changed. From a ranting and driving run it had tamed down to a running drag. The fox availed himself of the opportunity to widen the space between himself and his pursuers. He understood his business and passed over the most difficult places for scent—sometimes in roads, then open field just plowed, then among stock—never once stopping to ascertain if he was pursued. These tactics soon placed it out of our power to follow his track; but he tarried to give the dogs full opportunity to mark his direction if nothing more.

When every effort to work it out had failed, and there seemed to be no chance to mend matters, it then became necessary for the huntsmen to interfere. A circle was determined upon, each huntsman making one with his own pack, one within the other. I took the outside or widest circle. This move was a success. We stumbled up the fox and interrupted his slumber. In his confusion he dashed right back toward the packs, and they frantically took back track and could not be recalled or sighted for some time; while one of my Byron puppies (Brevity) and Rawlings's Hudson (full brother of Tom Wilkins) had run him out of hearing. Ah! how exasperating! But such mishaps have their pleasure. When we corrected the error of the pack, we went in the direction of the last notes of Hudson and Brevity. The pack followed the track over which they had run with hesitating earnestness, but finally came up to them at fault in an open wheat field. Here we waited the work of the pack, and after a while scent was regained, and with pretty regular stride old reynard was pursued again. But the old fellow knew the odds against him, and worked hard and cunningly to overcome them. But the run increased in vim and the space every

moment grew less and less between him and the pack. But the run was not yet over. The game and speed of the fox was equal to his strategy, and all were wonderful. "Hands off, boys; no interference," I exclaimed as the excited huntsmen would dash by me. The order was obeyed, and the race was a fair one. Two hours this state of things lasted and might have continued longer but for the fox's unfortunate turn in the mouths, as it were, of Stonewall and four Byron puppies (who, by the by, run and trail in a group) Bluebell, Bawdy, Fairman and Famous.

This ended a most spirited and gamelike hunt, in which the Byron puppies (including Rawlings's two black and tans) exhibited marked endurance. We rested a few minutes to eat a pocket snack that each had provided for the occasion. It was now far advanced in the evening and we were some distance from our homes. Our way there was as we came, and by our morning's route.

The fun had not yet terminated, though all of us had had the forepart of the day as much as a reasonable ambition could covet. Just as we arrived at the place of our morning's meet Stonewall struck a traveling fox. He, with several of Rawlings's pack, took the back track. We held a conference and determined to have a second run. We stood still until Stonewall and company had corrected their error and had returned to try the right end. We then joined in with the whole pack in a most enjoyable warm trail, resulting, after an hour's continuance, in a run which, for dash and vigor, was never excelled. The fox ran back to our morning's grounds and spent his time in repeated rounds over the same ground. He, like the other, was game to the end, and a much gamer fellow. He stood a press from the very beginning and never once gave signs of distress. Nor did the hounds.

The March wind had lulled, the evening dew had begun to fall. All this in favor of scent. The younger huntsmen did not follow Rawlings and myself in the exhilarating trail, but waited for us to rouse the game. After this was done they came in like charging cavalry and hung on to the end. My day was spent before the race closed, and to the credit of the hounds let it be recorded that no flagging, no change was exhibited from beginning to its end. T. G. T.

GASTON, N. C.

THE PROPER SIZE OF BEAGLES.

Editor Forest and Stream:

Being a great admirer of the beagle, and having bred them for a number of years for my own use, once having as many as twenty-four and at no time since I became interested in them less than five, I was much interested in recent communications from "Flat" and "Rusticus" concerning their proper size, and would like to give the measurements of my largest, smallest and an average size dog of my pack, the result of many experiments and trials, and which, for this northern country, I consider the right size.

My largest is 16 inches at the shoulder, girth of chest 24 inches, girth of loin 19¼ inches, from tip of nose to set on of tail 32 inches, length of tail 11¼ inches, girth of forearm 6 inches, tip to tip of ear 17¾ inches. My smallest is 14½ inches at shoulder, girth of chest 20½ inches, girth of loin 17½ inches, nose to set on of tail 29½ inches, tail 10 inches, girth of forearm 5½ inches, tip to tip of ears 16½ inches; and my average-sized dog is 15½ inches at shoulder, girth of chest 21¼ inches, loin 18½ inches, nose to set on of tail 28½ inches, length of tail 10 inches, girth of forearm 5½ inches, tip to tip of ears 17 inches.

The dog of 11 or 12 inches favored by "Rusticus" may be all right for some sections, but here in the North, where we have long cold winters, the snow is too deep for them to run well. I think we are all agreed that in a beagle we must have keen scent, good voice and lots of hang-on. I want more. I want a dog that at all times is ready and can run, and that means strength and height. Mine, I think, hunted on an average three days a week from October to March, and were never laid up a day. I use them after rabbits, foxes and deer, of which a number were killed in front of them last fall, all on runways, and they didn't drive out of the country those that were not killed either. I have bred them, not for bench shows, but for my own enjoyment and use, and from experience and numerous trials I claim that for a useful hound for the North 15½ inches is none too small. SIZE.

PORT HENRY, N. Y.

ENGLISH KENNEL NOTES.

I WAS afraid the York committee would feel the loss of royal patronage. The doggy part of their show was a success and I sincerely hope the meagre attendance won't spoil the look of their balance sheet. Local shows are beginning to recognize the fact that to make success a certainty they must hitch the dog show on to some other local gathering, a flower show or agricultural meeting. The rustic magnates, their "aunts and their cousins," might not think it worth while to drive into the town to see the dogs only, but they are sure to visit the show after doing the flowers or cattle. No type of society is more guided by "what is the proper thing to do" than that composed of English provincials.

There are many things to be thought of when getting up a country show. The most important position to be filled is honorary secretary. Everything depends upon this official. It is advisable to secure some doggy gentleman of the neighborhood who has plenty of time on his hands and knows everybody. Of course he is honorary secretary, and his labors should afterward be rewarded with a present in proportion to results. He must be a mild-mannered man, for "rustical severity banishes all urbanity;" he should contrive to have his own way with the committee in seeming to yield. His first duty is to call upon the lord of the manor, who is usually a nobleman, his name as patron is of value and he is also good for a subscription. When the minor notabilities of the neighborhood see his name on the list they will also contribute donations toward the prize fund according to their means or social pretensions. The doctor and lawyer, and also the parson can be counted upon for this purpose. The inn-keepers of the town will give a prize for the best bulldog, the brewers for the best mastiff, etc. Some honorary secretaries are clever enough to get in this way most of their prize money, and will avert failure by instituting among the committee a guarantee fund. The committee must be practical men and ready to their share of the work.

Catalogues of big shows should be distributed among them and each man should take so many letters of the alphabet, say A to F, G to M, in the list of exhibitors' names and write to them for entries. This is a great catch, and as the receiver of this special letter feels pleased with the attention, it generally succeeds. The printing of schedules and catalogues should be given to the local stationer, who in return, will be expected to do the stationery cheap and also give an advertisement. The large biscuit firms and disinfectant companies will also take page advertisements; publishers and authors of works on dogs can also be counted upon in this direction. During the show the committee should employ themselves as ring and bench stewards. A banquet should be held on the evening of the first day of the show, to which the judges should be invited, and the tickets should be cheap to allow all exhibitors to attend. A few speeches can be made, everybody's health drunk, and the whole company is made happy. The successful fancier will naturally show again and the disappointed exhibitor forgets his wrongs and hopes for better luck next time. Prompt payment of the prize money is all that is needed to complete the popularity of the show.

At York they had a little difficulty with some classes that did not fill, and where a certain number of entries were not received those who had sent had their money returned. This was unfortunate and showed some lack of judgment, because the effect was naturally irritating.

One of the celebrities of the dog world has gone over to the majority—Bill George, of Canine Castle, Kensal Town. He was personally better known to our sporting parents than to the present generation. No man's name was more familiar in English-speaking doggy circles all over the world than Bill George's. His kennel was one of the show places to take foreign sportsmen to. Many an instructive afternoon have I passed in the veteran's company as I sat in his yard pulling at a partagas and listening to the old boy's reminiscences of mastiff and bulldog lore. Pedigrees he knew by the yard, and strains by generations. He grew intolerant in that good old-fashioned manner of modern dogs and men, and was naturally kind to the "fanciers of dogs in my time, sir." He had executed orders in dog flesh to all parts of the globe, and his trade brought him into connection with the highest and the lowest in the land.

Now he is gone, I dare say many will recollect anecdotes and sayings about him. One I heard is very funny. A letter directed to "Bill George, London," was, during the Postmaster-Generalship of Lord Manners, returned to its sender for insufficient direction, and stamped outside "Not known." The writer of the letter soon after went to London and called on George and related the incident. George heard him with an affected surprise and indignation, and looking round at some other visitors he had there, remarked: "Well, all I can say is, if Manners don't know Bill George, then Bill George don't know Manners." He was not half satisfied with the laugh that greeted his innocent *bon mot*.

Some of our papers are commencing an unwise attack upon M. Pasteur for the dogs' lives the learned professor has had to sacrifice in his great search for the antidote to hydrophobia. Could anything be more unreasonable? The infliction of pain upon dumb animals, however necessary, is deplorable; but is it to be condemned right out and prevented when the sought-for results are of such immeasurable importance to humanity and dogs themselves? It always has been and always will be the fate of the few to suffer for the many.

The continuation of the Lochinvar correspondence has brought a fresh combatant into the field in the person of Mr. G. Krehl, well known as an exhibitor of Irish terriers. This gentleman complains that Mr. Murchison has accused him in strong terms of abusing the manager of the show. Mr. Krehl is well known among the inner social circle of doggydom, and will no doubt amply refute the charges brought against him. He has written a very quiet letter asking for evidence. Danger is discernible in this quiet reserve, for the writer is an old hand at controversy. What must astonish most people, though, is that a man whose "public form" is so much "exposed" as Mr. Murchison's, should be allowed to write the violent letters that have appeared on the subject. His coarse attacks upon well-known gentlemen would disgust, if they did not also amuse a little, those who get sick of seeing "nothing in the papers." The battle is proceeding in the *Stock-Keeper*, having been stopped in the *Field*.

From Murchison to Carter is an easy digression, and I am sorry to see an undignified attack on the latter in the current number of the *Kennel Gazette*, which is the official organ of the Kennel Club. The friends of this body must see with regret their powerful position used to kick a man when he is down. I once met Mr. Carter during one of our northern shows, and it was the opinion of several of us that he had been made the victim of powerful foes. I have heard that he has sold his paper, the *Kennel Review*, given up dogs and gone abroad.

I observe that you, also, have your doggy quarrels in America, but a much better tone pervades your correspondence than we can boast of over here.

I read with amusement a letter on dachshunde in your paper of May 29, signed "Aufwiedersehen" (whatever does it mean; if we were to adopt such *noms de plume* our editors would tear their hair). Your correspondent has added another puzzle to my already confused notions of a dachshund. I have one myself—a sweet little, queer, old lady—she is a glossy black and tan, not very long in the back, powerful forelegs very much bent. I was going to show her, but before risking the entry fee I consulted an authority on the breed. "Not worth the tax," was his disheartening criticism. "Why, she's the German terrier type; look at her broad skull between the ears and short muzzle." "Well?" I querried. "Well!" he replied, "it isn't well; the hound type is the thing, long thin face, weasel body; but mind you, my lad, I daresay she'll go to ground for you, kill rats, fight cats and all that sort of thing, but she won't do for showing." At the mention of rats Dinah raised her ears and looked at his calves. Terrier or hound seems a vexed question, as I understand German authorities go for the former. But what is the "Hanoverian type" and what is a "spielhund" spoken of by your correspondent with the name of many consonants? LILLIBULERO.

JUNE 17, 1884.

THE KENNEL HOSPITAL.

WOUNDS.

THERE are various kinds of wounds. Incised or clean-cut wounds are the simplest and most easily treated, because the parts are not bruised, and no tissue is removed or destroyed. Such wounds may gape considerably, especially when they are made across the fibers of a muscle, but they admit of being drawn together, and then we obtain exact co-aptation of the sides of the wound. Clean cuts are usually accompanied by a good deal of bleeding.

Punctured wounds are those made by pointed instruments, are usually deep, and show but a small opening on the skin. They are dangerous, because they may penetrate deeply, and injure important organs. They require careful examination, because their extent is not visible, and some agent may be left in them, such as a splinter of wood, which is certain to gravely interfere with the healing. Even when no foreign substance is left in them, blood from the injured tissues is apt to collect and form a clot, which causes inflammation.

Lacerated wounds are those caused by tearing. They seldom present much bleeding, because the blood vessels being stretched and twisted contract at their extremities. They do not heal so well as incised wounds, owing to the damage done to the tissues by bruising and stretching. Not unfrequently, too, some portion of skin or other tissue may be altogether removed, and thus prevent our being able to bring the edges of the wound exactly together.

Contused wounds result from blows with blunt instruments. When the skin is not broken they are simply bruises, varying in severity according to the amount of damage inflicted upon the tissues beneath. This may be slight or of such a degree as to destroy the structures entirely. When the skin is broken a contused wound resembles a lacerated one, and its gravity depends upon the amount of damage done to the vitality of the injured parts. The proper treatment for wounds will be best understood if we first very shortly consider the mode of healing found to take place under different circumstances.

Practically all wounds heal by one of two methods—by adhesion or by granulation. Healing by adhesion takes place in wounds which, when bleeding has ceased are brought closely and evenly together and retained in position. No matter is formed in such a process, as inflammation does not reach the stage at which suppuration is set up. The only exudation that occurs is a thin layer of lymph on the cut surfaces, and this becoming organized re-connects or, so to speak, glues together the divided tissues. This method of healing cannot take place if any foreign substance intervene between the surfaces of a wound, nor even if a clot of blood be allowed to collect. It is prevented by splinters of wood, hair, or dirt being left in a wound. It is equally impossible if the tissues are destroyed by bruising or by the application of caustics, and it is rendered ineffective by the too common practice of applying tinctures and ointments to a cut surface. When healing by adhesion does not take place a wound gapes, matter is formed as the result of inflammation, and in a short time the surface is seen covered with reddish fleshy growths, commonly termed "proud flesh," or by the surgeon granulations. These growths continue until the whole wound is filled up, and then contract gradually, causing the edges of the original wound to approach each other. By the contraction comparatively large gaping wounds are healed with a wonderfully small scar. The scar or cicatrix marks the place where true skin is replaced by fibrous tissue, skin itself not being reproduced.

Just as the surfaces of a fresh wound may unite by adhesion so may two surfaces covered by granulations adhere together if retained in apposition. In some positions this is to be guarded against, as, for instance, when granulated sores exist between the thighs. In some large wounds this union of granulations may be taken advantage of and the healing of a wound much facilitated by bringing in contact the two surfaces. Healing by granulation is always a long process, accompanied by discharge of matter and a good deal of pain. It should be our object, then, always to attempt healing by adhesion, unless the nature of the wound renders that method clearly impossible.

Bearing in mind what we have just said, the treatment of wounds becomes a very simple matter. Nature will effect the repair if only we put the parts in the most favorable position. The method of repair will depend upon the condition of the parts, and our assistance to be of any value must be directed to facilitate the method adopted by nature. Incised or clean cut wounds are most likely to be troublesome on account of bleeding. Our first endeavor, then, is to stop this. When a large blood vessel is cut its extremity must be tied—an operation few amateurs could manage. Pressure directly upon the bleeding part is the next best remedy, and can be applied by means of a pledget of tow or wool held in position by a bandage. Wounds of the legs in which large vessels are divided may often have the bleeding stopped by a ligature tied tightly around the limb above the wound. This acts by checking the passage of blood from the heart, and is therefore only applicable to wounds of arteries. When veins are cut pressure on the cut spot or below is requisite. To know what kind of vessel is cut we must remember that arterial blood is bright red, and escapes in jets, while venous blood is dark red, and flows in a steady stream. The ordinary bleeding from a wound does not come from large blood vessels, and may be stopped by cold and pressure combined. The cold is applied by a constant flow of water from a sponge, and the pressure may be applied either by a bandage or by the fingers. It may be necessary to firmly bind up a wound to stop the bleeding, but if healing by adhesion is wished, it must be opened out again when bleeding has ceased and any clots of blood removed. When an incised wound has ceased bleeding, and before the cut surfaces are dry, a little clear colored fluid exudes; this is the time to bring the wound together and firmly retain it in position. Of course before doing this all foreign matter is carefully removed. Pieces of glass are not so easily seen in the depths of a wound, but are easily felt if an examination is made with a metal probe. Wounds of dogs' feet are often made by glass, and should be carefully examined before being closed. To hold the lips of a wound together, either stitches may be employed or pins. Stitches, surgically called sutures, may consist of catgut, wire, silk, or thread. The two latter absorb fluid and may cause suppuration. Wire does not adapt itself easily unless very thin, and then is apt to cut before healing is complete. I prefer pins, which are easily used and very effective. The two lips of the wound are transfixed by the pin, and round the pin is twisted a piece of thread. By this means the wound is firmly closed, and there is not much direct pressure on the pin. Steel pins are sold for the purpose by surgical instrument makers, but they are objectionable as being liable to rust and not easily cut or broken. The ordinary draper's pins are best; they are tinned and never rust, and their points after insertion are easily removed with a pair of pliers. The old dread of pins "cankering" a wound is a fallacy which might possibly have had some basis when pins were made of untinned brass wire. The pins in a moderate-sized wound should be about half an inch apart, and should be inserted about a quarter of an inch from the edge of the wound, so as to have a firm hold. When the thread has been twisted round them, push the head of the pin close up to the thread, and cut off the points. About the fifth day every other pin may be withdrawn, and the remainder when healing is complete. Wounds may be closed and held together by means of strips of adhesive plaster. To render them effective the hair must be shaved or clipped very closely from the edges of the wound, so that they may stick to the skin. To obtain healing by adhesion, a wound after being closed must be kept dry and cool. Nothing spoils the process so certainly as heat and moisture. To prevent a dog from tearing out the sutures, it is sometimes necessary to apply a dry bandage over the wound, but it is better to tie up the animal's head, or muzzle him, leaving the wound uncovered and cool.

Lacerated wounds require more judgment to treat properly than clean incised ones. They often result from dogs being partially run over, from bites while fighting with other dogs, and by tears from projecting nails. In such cases sand and dirt may be imbedded in the wound, portions of tissue may be crushed and completely disorganized, or portions may be so torn as to be left hanging in shreds. Careful washing and cleaning is the first thing to do, and as such wounds seldom bleed much, warm instead of cold water may be used to facilitate the removal of dirt. All portions of positively crushed tissue must be removed, and shreds of flesh hanging by such small connections as to suggest their being hopelessly cut off from the circulation may also be cut off. It is a good rule never to cut off any shreds of skin from a fresh wound. They offer a hold for sutures, and thus assist in bringing the parts together and helping to retain them in position; they protect the parts beneath, and can be easily removed when in time it is found impossible to save them. A badly lacerated wound will seldom heal by adhesion, yet we treat it at first as though it would by carefully adapting all the parts and firmly closing it. By so doing some parts will generally adhere, and if in three days it be found that no union has occurred, or sooner if pus be formed, we remove some or all of the sutures. In wounds so formed as to cause a flap of skin or other tissues to hang down, and which may probably not heal without suppuration, we must remember that by closing them a sort of pocket is formed in which fluids may collect, prevent healing, and do much harm. In all wounds that do not heal by adhesion, we want free escape of fluids secreted. Naturally fluids find their way to the lowest part of a wound, and that is the position we must try to effect their escape from. In closing wounds, then, in which adhesion is not expected, we should leave the lowest part without any sutures.

Sometimes a wound is not detected till long after it has been caused, when the lips of the wound are swollen, and the surfaces dried. In such cases it is often impossible to bring the edges of the wound in apposition, and it must be treated solely with a view to healing by granulation. So also must all wounds where there is great loss of skin and all superficial sores in which suppuration has commenced. Heat and moisture favor the growth of granulations, and in these cases these may be employed in the form of warm fomentations to a moderate extent. Heat and moisture, however, favor suppuration, and that we do not want. After the first day warm water is not required, except to clean a wound. We can stimulate the growth of granulations by other means at the same time that we limit suppuration and prevent deleterious changes. For this purpose we use carbolic acid and oil, compound tincture of myrrh, etc.

When a wound is filled up by granulations, and they begin to rise above the surface, they must be kept down by astringents, or even by caustics, and by pressure applied by means of a bandage. Solid sulphate of copper or bluestone may be rubbed on the surface of too exuberant granulations. Nitrate of silver or lunar caustic is also useful.

Punctured wounds must be probed so that no foreign body is left in them. The probing must, however, be judiciously done lest damage be inflicted by the probe on some important structures. In the neighborhood of joints only the most careful use of a probe is permissible. The direction of a punctured wound bears very directly on the course of treatment to be adopted, one on the upper part of the body being likely to heal less kindly than one on the lower part—this simply because the latter has a dependent orifice from which any fluid can drain. The wound inflicted by large canine teeth is often a punctured one, and therefore these wounds are liable to be complicated by the introduction of poisonous matter, about which we shall have more to say.

Contused are to be treated in the same manner as lacerated wounds, special attention being given to the amount of bruising inflicted on the tissues. If this be out of proportion to the wound we treat as a bruise, and leave the divided tissues as a secondary manner. If, however, the wound be of more importance than the bruise we follow the principles already discussed, using, perhaps, a little more heat and moisture at first to allay pain and promote absorption of swelling than if less contusion existed.

FRACTURES.

In dogs the most frequently broken bones are those of the legs, but we occasionlly meet with fractures of the spine, jaw, and ribs. Whenever a fracture occurs, the general principles of treatment to be applied are the same, the practical details differing chiefly according to the manner and degree in which other tissues are involved. A bone may be simply broken across or it may be splintered into a number of fragments, whence we distinguish simple and comminuted fractures. When a wound exists over the seat of fracture and penetrates to the bone, we have what is called a compound fracture.

In all animals bone is one of the tissues most easily reproduced, and in dogs the repair of injured bones is especially active. Even when a bone is left to nature, union is usually effected, although at the expense of some deformity. What we have to do in rendering surgical assistance is to prevent this deformity by replacing the injured parts in their proper positions, and retaining them there until nature has effected the repair.

The repair of bone follows a regular course just as the repair of other tissues. It is interfered with by the inflammatory process, and facilitated by the perfect adjustment of the damaged parts. The union of a broken bone is effected by the production of new bone between and around the broken ends, but this is the last stage of the process. What first happens after a fracture is swelling at the part, due to the exudation of lymph. This exudation becomes gradually consolidated. Ossific matter is deposited within it, and while it is slowly converted into bone, it becomes smaller by absorption. The conversion of the soft swelling into bone causes a bony enlargement at the seat of fracture, and as this is not desirable, it should be remembered that the earlier a fracture is reduced and all movement of the broken ends of the bone prevented the less will be the amount of surrounding swelling. The soft swelling surrounding a fracture is called the temporary callus; the bony enlargement which replaces it is termed the permanent callus. Other swelling as the result of fracture we too often have, but it is not connected with the process of repair. It is a complication and an evil resulting from the damage done to the soft tissues by the injury which causes the fracture, or it may be by the broken ends of the bones cutting and tearing the parts, causing the escape of blood into and among the tissues.

The symptoms of fracture are lameness, swelling from effusion of blood, distortion of the limb or change of shape of the neighboring parts, twitching of the muscles, due to their being irritated by the sharp ends of the bone, unnatural mobility when the parts are moved into different directions, and crepitus, or a grating sensation when the fractured surfaces come in contact with each other.

The treatment of fracture, especially of the limbs of dogs, requires provision to be made for the impossibility of keeping the animal quiet. In all cases, then, in which a fracture is attended to immediately after the injury, and before much swelling has occurred, we advise the use of an immoveable apparatus. Where, however, great swelling has taken place, a temporary arrangement must be applied which can be easily removed in a few days when the swelling has subsided. In cases, for instance, of fractures of the fore-arm due to great violence, considerable swelling occurs very rapidly. A permanent bandage applied to the swollen limb becomes in a few days useless, as, when the swelling subsides, it no longer fits the part, and, from its nature, is most difficult to remove without causing great pain, and probably interference with the fractured ends of the bone. It is still more injurious if applied to a limb in which swelling is still going on, as, being unyielding, it causes great pressure and pain. It is necessary, then, to consider the state of a fractured part before anything is done, and to decide whether a temporary or a permanent bandage is likely to be most suitable.

In the case of a simple fracture with much swelling we first approximate, as nearly as possible, the ends of the bone. When the ends of the bone override each other, the limb must be gently, but firmly, extended, so as to overcome the effects of muscular contraction. The use of chloroform facilitates this, and keeps the dog quiet while an apparatus to retain the position of the limb is being applied. Bandages and splints are our chief requisites, but they vary considerably in form and application. Their limited application to the mere site of injury is worse than useless, as they then not only cause pain by pressure on the part, but do not prevent movement of the ends of the bone. No fractured bone can be kept in position and movement prevented unless it be surrounded by an apparatus extending beyond the joints at each end of it. In other words, you must fix the joint above and below the seat of fracture if you wish to effectually prevent motion. In bandaging a limb it must be remembered that the pressure should be firm and even, always extending to the toes. By leaving the foot unbandaged the circulation below the bandage is interfered with, and swelling is certain. This is always accompanied by pain, and in some cases followed by mortification.

When bones are fractured in such a position as to render it impossible to apply a bandage which will fix the joint above, no bandage should be used, as it and the accompanying splints are only so much extra weight on the injured limb. Fractures of the thigh and shoulder come under this remark, and can only be assisted by attempts to limit motion. This is effected by tying the dog up short, and putting him in a cage or other confined space; and by applying to the affected part strips of adhesive plaster so arranged as to limit motion as much as possible. Adhesive plaster is quite useless unless the hair be first removed from the skin.

Splints for broken limbs may be made of cardboard, wood, leather, tin, or gutta-percha. They should be long enough to reach from the toes to the joint above the fracture. Two are required, and may be placed either on each side of the limb, or at the front and back of it. Bandages should be about 4 feet long, and from 1½ inches to 2 inches wide. The material should be soft and strong. Cheap new calico does not adapt itself nicely to the limb, and nothing is better than a portion of an old linen sheet.

After a fracture is reduced, and while the limb is kept extended, a soft, dry bandage is applied to its whole extent; portions of cotton wool being placed in the cavity behind the toes, over the prominences of joints, and also over the most prominent end of the broken bone. Thus we get a fairly level surface, allowing firm pressure by the bandage. Over this are laid the splints, which are then retained in position by another bandage. The ends of the bandages should be sewn, and to prevent the dog tearing it off, some adhesive matter should be applied to the extremities and free edges. Glue will do, or what I have found very handy, Prout's elastic glue—a substance sold by oilmen and leather dealers. Such an apparatus is easily removed, and is therefore most valuable when only required for a short time, as when much swelling exists. When we have a fracture with no accompanying wound and not much swelling, a less easily moved arrangement is desirable. This may be formed by using gutta-percha softened in hot water and applied over the first bandage, moulding it with the fingers to the form of the limb and closing it firmly at its edges by a few touches with a hot knife. The most perfect form of immoveable apparatus is the starched bandage. This is simply an ordinary bandage, unrolled, saturated in starch prepared as for laundry purposes, rolled up again, and applied over the first bandage already referred to. Until it becomes dry the position of the limb must be retained by two narrow splints placed over it and tied together by two or three pieces of tape. These are removed when the starch has "set," and the dog may be allowed to run about at once without fear of displacing the bones.—*Wm. Hunting in Land and Water.*

CURRENT DOG STORIES.

XXXII.

The dog which so gloriously distinguished himself by giving warning of the fire at the Hoffman has again been heard from; but this time in a matter not so heroic as the first attempt. Evidently the praises won by his intelligent act mentioned have so turned his head that the habits of the canine mob and common herd are distasteful to him. As a Columbus avenue car was turning into Tremont street in its up-town trip the other day, it made the usual halt, and a medium-sized dog stepped aboard. Escaping the notice of the conductor, he jumped upon the cushion and gravely seated himself with the other passengers. After the car started the conductor noticed his fare, and stepping to the gentleman who sat next to the dog, informed him that the dog could not ride. The reply was given that the dog was a stranger to him, and the conductor proceeded to eject his four-footed passenger. The dog put on the amiable look that follows the command to "move up on the left there" so naturally, and resisted the attempt to dislodge him so doggedly, that a lady who recognized the animal as he came into the car recited his history to some of the passengers, and at their earnest request he was allowed his seat, while further developments were watched. His dogship rode in stately dignity, only needing a pair of glasses and a journal to enable him to fraternize with his fellow-passengers, until the car stopped at Berkeley street, when all eyes were turned upon him; but no signs of alighting. The lady commenced to think it was a case of mistaken identity, but as the car started the dog coolly stepped to the floor, and, waiting till the platform was opposite the main entrance of the Hoffman, which is perhaps two hundred feet from where the car stopped, wagged his tail to the conductor, with a "tra la, old man, don't stop on my account," sprang off and ran up the steps. Inquiry of the elevator boy at the Hoffman reveals the fact that for some time the dog has refused to walk up stairs, but has waited for the elevator or has signalled for it by whining or crying. Theories are left to logicians and metaphysicians. The facts can be substantiated by a number of witnesses.—*Boston Journal.*

XXXIII.

There was great rejoicing in a South street household this morning over the restoration of a pet dog. Three weeks ago this day Dot was missed, and even a three-line advertisement in the best advertising medium in the county—the *Advertiser*—failed to disclose his whereabouts. The owner was plunged in grief at the unaccountable disappearance of the pet, and was nearly prepared to suspect the neighbors of foul play. It also worried the almost life-long employe of the family, and last night his sleep was troubled by dreams in which he constantly saw the missing dog in an old unused well, partially filled up with dirt and ashes, beneath the side piazza. He was so deeply impressed with the dream that he was unable to sleep after midnight, and at 6 o'clock this morning the family was startled by the sound of loud hammering on the side piazza. The man was removing the flooring, and sure enough, when the well was exposed to view, there was the missing dog, alive and well, and overjoyed at the prospect of liberation. Although confined three weeks in this narrow prison, without food or water and air not of the purest, Dot seemed as lively as ever, with no appearance of emaciation.—*Auburn (N. Y.) Advertiser.*

XXXIV.

A Newfoundland dog, jumping from its owner's garden in England over a wall three feet high, fell upon the neck and back of a laborer who, in a bent position, was digging a hole in an adjoining garden, and injured him severely. The owner of the dog gave a couple of sovereigns to the injured man, who, not satisfied with this *solatium*, brought an action for damages in the County Court, but was non-suited. He appealed to the Court of Queen's Bench. Lord Coleridge called his claim "preposterous," but gave it a grave consideration, and affirmed the decision of the County Court Judge.

JOHNNY'S ESSAY ON DOGS.—The Dogs is a great Sourse of national wealth but the Buffalows is nearly extincted. The Dog is a domestic animal like the Wolf and Fox but most dogs wont stand it if you tramp on their tale—he is knockternal in his habits but he dont squeel like the Mule & pig. We have three dogs and Uncle Ben says all 3 aint worth a damp plug of tobacco to hiss. If you dont give dogs enough to eat he becomes so avaricious he will attact Human people and on account of his great Fidelity to Man he is called the King of Beasts. The dogs are a ruminating animal and if he had borns he would chaw his quid. You can know he is dreaming when he wants to Bark and cant git his mouth open, but if something makes our dogs awake at night Uncle Ben says they make sich a Racket like if all the Hail was broke loose. Dogs is a sourse of great Pleasure as the Faithful Companion of the lonely traveller and when our Watch sees a peddler or somebody going apast our house he lays low till he gets past then he sneaks up behind and bites his legs—Every dog has his day—Bill Thompson says that's the Law and you cant git over it and he says the Dog Days was made so every dog could have their days all at once, our Teacher she says the dog belongs to the Wolf Family but Uncle Ben laughed, he said he knowed better than that with his one eye shut, for he said he bets a wolf would be a doggoned niee Family Man. This Faithful Animal Guards the house at night while all the house is Rapped in Peace full Slumber and Bill Thompson he says if a dog has wool in his teeth the next morning its a sign he teared sheep that night. And a dog aint no Beast of Pray, but our Teacher she says that don't mean that he's worse than other people for she says it don't mean that kind of Pray—but the New Found Land dog is the gayriest of the whole Lot who can swim more than a week before he Ascends to the surface to Breathe, he is therefore called the Ship of the Desert. And a Inglish bulldog is awful onery to look at—Uncle Ben says if a Inglish bulldog looks like that he would like to see a Dutch one. Bill Thompson he says they are called Inglish Bulldogs because he says in Ingland the people use them for bait when they want to ketch bulls and that kind of ketching fish is called Bull baiting, and Bill Thompson, he says if a full bloody Inglish Bulldog ketches a Holt of a Steer's nose he is so sagacious that he wont let go even if you cut off one of your Hine legs. Dogs is like other creatures and can't talk, but Bill Thompson he says in Old Times before the war Dogs could talk Latin but now nobody can talk any more Dog Latin except the professors in the Collidges. The dog is Up on the hole the Caninest animals that ever was and when Prof. Daisyhead made a address in our school he said if he had knowed as much about Scientif Animal as us Boys he would a had a show to be President too but he said in them Dark Ages where he was born boys had no show to be President but Jo Simmings said he would sooner run a Engine than be President because Garfield killed him, but Bill Thompson says Jo hasn't got Back Bones enough. Our teacher she learnt to talk french at Miss Krautschwanger's Boarded School and she says if you want to make a dog stand on his Hine legs in french and make a Bough, you just say O Reservoir Mon Chair.—*The Judge.*

MISTAKE IN PEDIGREE.—Hudson, N. Y., June 28.—*Editor Forest and Stream:* Regarding Mr. Dilley's assertion that the pedigree of my pointer bitch Fancy was not correct, would say that I purchased her from Mr. Callender (Rory O'More Kennels) last February, and I inclose to you the pedigree for inspection and publication that Mr. C. gave me at time of purchase, and which he said was correct; he also stated that she was about three years old. No one is more interested in the matter than I am, and if said pedigree is proven to be incorrect I should be most happy to get all the information possible on the subject.—H. C. MILLER. [We have received from Mr. Miller what purports to be the pedigree of Fancy, the bitch in question. There are errors enough in the pedigree to condemn it as spurious, aside from the fact that Mr. Dilley states that she cannot be as represented, as there was only one bitch of the litter sold, Cara C., who is registered in the first number of the *American Kennel Register.*]

FOX HUNTING.—The following which we clip from the Toronto *Mail*, of June 23, is respectfully submitted to our cousins across the water who so freely criticise the Yankee method of sport with *Vulpes:* "The first meet of the Toronto Fox Hunt Club, took place on the lake shore of the island, on Saturday afternoon, quite a number of city sports participating. Two foxes were taken out, and each, when released, got five minutes start of the dogs. Cooper and Donnelly's bull-terrier Oscar, caught both foxes after a hard run. All breeds of dogs were entered. Greyhounds, Bedlingtons, pointers, collies, setters, terriers, etc. A large number of people, including many ladies, were present to witness the sport. It is the intention of the club to have another meet at an early day.

BEAGLE LOST.—Mr. A. McDonald, of Rockland, Me., has lost his beagle dog. He stands about 15 in. at shoulder, and has more black than white, with dark tan markings on head. It was thought that he was taken away on a schooner. Any one learning of his whereabouts will confer a favor by notifying his owner.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Hush Money, Hard Times, Highland Boy, Hard Cash, Harefoot, Hawthorn Bell, Hawkeye and Harmony. By Mr. H. W. Huntington, Brooklyn, N. Y., for one black, one blue, one fawn and two black and white dogs, and three black and white greyhound bitches, whelped June 11, 1884, by his Doubleshot (A.K.R. 73) out of his Cho (Badger—Fan).

Burr. By Mr. C. Frank Gram, Washington, D. C., for beagle dog, whelped Feb. 21, 1884, by Joy out of Nelly.

Snip. By Mr. Fred. McDewell, Boston, Mass., for black cocker spaniel dog, whelped April 29, 1884, by Obo II. (A.K.R. 432) out of Smut II. (A.K.R. 858).

Editor Forest and Stream: Surrey Sam, for whom name was claimed in your last issue, is a dog, not a bitch, as printed. Please make correction, and oblige SURREY KENNELS.

NAMES CHANGED.

☞ *See instructions at head of this column.*

Rosa F. to Dashing Blue Belle. English setter bitch, 1 year old (Dashing Monarch—Leah II.), owned by Mr. John G. Heckscher, New York.

BRED.

☞ *See instructions at head of this column.*

Vic—Glencho. Mr. C. H. Dayton's (Peekskill, N. Y.) red Irish setter bitch Vic (Elcho—Lady Helen) to Mr. W. H. Pierce's champion Glencho, May 5.

Daphne II.—Cæsar. The Essex Kennel's (Andover, Mass.) St. Bernard bitch Daphne II. (A.K.R. 489) to the Forest City Kennel's Cæsar (A.K.R. 22), May 25.

Judy—Young Toby. Mr. W. Jordan's (Portland, Me.) pug bitch Judy (A.K.R. 406) to the Chequasset Kennel's Young Toby (A.K.R. 473), June 20.

WHELPS.

☞ *See instructions at head of this column.*

Sibil. The Forest City Kennel's (Portland, Me.) St. Bernard bitch Sibil (A.K.R. 757), June 21, thirteen (seven dogs), by their imported Cæsar (A.K.R. 22).

Juno, The Forest City Kennel's (Portland, Me.) pug bitch Juno (A.K.R. 406), May 18, five (two dogs), by Young Toby (A.K.R. 473).

Rita Croxteth. Mr. Geo. S. Tucker's (Peterborough, N. H.) pointer bitch Rita Croxteth (A.K.R. 108), June 10, ten, by champion Meteor; two since dead.

Dashing Belle. Mr. E. W. Jester's (St. George's, Del.) English setter bitch Dashing Belle (A.K.R. 814), June 26, four (three dogs), by his Zanzibar (A.K.R. 1182).

SALES.

☞ *See instructions at head of this column.*

Breda Girl. Irish water spaniel bitch, whelped Sept. 30, 1883 (Wallace—Duck), by Mr. Wm. Graham, Newtownbreda, Belfast, Ireland, to Milwaukee Kennel Club, Milwaukee, Wis.

Noblesse. Smooth-coated St. Bernard dog (A.K.R. 803), by the Chequasset Kennel, Lancaster, Mass., to Mr. J. Burk Wolfe, New York.

Hugo. Orange tawny, with white markings, rough-coated St. Bernard dog, whelped March 6, 1884 (Cæsar, A.K.R. 22—Nun, A.K.R. 24), by the Chequasset Kennel, Lancaster, Mass., to Mr. C. P. Head, Prescott, Ariz.

Count Herod. Liver and white cocker spaniel bitch, whelped March 6, 1884 (Teddy Barr—Vic), by Mr. Archibald Gordon, Middletown, N. Y., to Mr. W. B. Allen, Indianapolis, Ind.

Blossom. Liver and white cocker spaniel bitch, whelped March 6, 1884 (Teddy Barr—Vic), by Mr. Archibald Gordon, Middletown, N. Y., to Mr. W. B. Allen, Indianapolis, Ind.

Humboldt. Orange tawny and white rough-coated St. Bernard dog, whelped March 18, 1884 (Cæsar, A.K.R. 22—Nun, A.K.R. 24), by the Chequasset Kennel, Lancaster, Mass., to Mr. H. W. Weidman, Cleveland, O.

Grimsel. St. Bernard dog (formerly Nestor) (A.K.R. 802), by the Chequasset Kennel, Lancaster, Mass., to Mrs. E. S. Crowninshield, Boston, Mass.

Isar. Orange brindle and white smooth-coated St. Bernard dog, whelped March 19, 1884 (Cæsar, A.K.R. 22—Brunhild, A.K.R. 23), by the Chequasset Kennel, Lancaster, Mass., to Mr. R. H. White, Boston, Mass.

Snip. Black cocker spaniel dog, whelped April 29, 1884 (Obo II.—Smut), by Mr. H. C. Bronsdon, Boston, Mass., to Mr. Fred. McDewell, same place.

Obo II.—Smut whelp. Black cocker spaniel bitch, whelped April 29, 1884, by Mr. H. C. Bronsdon, Boston, Mass., to Mr. Robert Walker, Franklin, N. Y.

Eckhardt. St. Bernard dog (A.K.R 413), by the Mill Brook Kennel, New York, to Mr. N. S. Hay, Boston, Mass.

DEATHS.

☞ *See instructions at head of this column.*

Anne Boleyn. Red Irish setter bitch (A.K.R. 611), owned by Mr. Theo. L. Riddle, Custer City, Pa., June 22.

Rifle and Trap Shooting.

RANGE AND GALLERY.

BOSTON, June 28.—There was a good attendance at Walnut Hill to-day, and considerable shooting done in the different matches. The fact that the present matches, which have been running since Fast day, are to close on July 4, served to bring out a good company of shooters who found good shooting conditions. In addition to the regular matches a team shoot was had by telegraph with the Manchester Rifle Club. In this match the Massachusetts "steer" team was beaten by eight points. Mr. Francis made an elegant score of 48 on a paper target, which would have counted 85 decimal, and Mr. Fellows closed with a 45, the best possible. Mr. Perkins proved his quality as a shooter by holding off for a 47 in both the practice and Creedmoor matches. On Wednesday next the shotgun men will try conclusions. The best scores made were as follows:

Creedmoor Practice Match.

J Francis	5555555544—48	W H Morton	4544444445—42
F W Perkins	4544555555—47	D B Farwell	4444544441—41
C E Berry	5455454545—46	J E Darmody (mil.)	5454344435—41
C B Edwards	4555454544—45	D E James (mil.)	3444545534—41
A Keach	5544445444—43	C Challet	3443433544—37

Creedmoor Prize Match.

J B Fellows	4555555555—49	W Fisher	4445545551—44

SAN FRANCISCO, June 20.—Four members of the Fifth Infantry shot a match at Shell Mound to-day, and endeavored to beat Lieut. Kuhnie's record of 457 out of a possible 500 points. They each fired 100 shots at the 200yd. target. Lieut. Kellogg's score was:

First	5444544554—45	Sixth	4444544554—43
Second	4455s4544—45	Seventh	5445545445—45
Third	4554454454—44	Eighth	5495544535—46
Fourth	5545455454—46	Ninth	5555545554—48
Fifth	4544555554—46	Tenth	4544555545—46—454

The scores of his competitors were as follows: Kellogg 454, Moore 424, Hovey 443, Waltham 438.

A regular match between four staff officers and four members of Company A, all of the Fifth Infantry, will take place at Shell Mound next Sunday, and the names of the marksmen are a sufficient guaranty of an exciting contest. The officers are: Lieut. Kellogg, Lieut. Kuhnie, Sergt. Williams and Sergt. Hovey, and their opponents are: Sergt. McDonald, Priv. Waltham, Priv. Burrell and Priv. Pierce. Col. Ranlett offer a handsome medal to any one in this match who beats the record of 457. Next Sunday there will be other interesting matches by members of the Fifth. Waltham No. 17 challenges Moore No. 4, Williams No. 11 challenges Carroll No. 9, and Pierce No. 8 challenges Kellogg No. 1.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

PROPOSED TOURNAMENT.

To the Gun Clubs:

It is our opinion that gun club contests, if properly presented to the public, can be made sufficiently interesting to eventually place this sport on a broad national footing, similar to base ball. Therefore, with this end in view, it is our intention to organize clay-pigeon tournaments in the principal cities, provided you give us your co-operation. The general plan we desire to pursue is outlined in the following; if the offer is accepted, we guarantee to spend at least $250 in organizing and advertising same, etc., etc.; if this proves a success we will follow same very shortly with a tournament at Boston, Philadelphia, Washington, Pittsburgh, Bradford, Buffalo, Cleveland, St. Louis, Cincinnati, Nashville, etc.:

A two days' programme will be held at New York city, Aug. 1 and 2, 1884, provided at least 10 teams of 3 from organized clubs will enter for the principal contests by July 9, by remitting $10, part of entrance fee, to the undersigned. The principal contest will be: Entrance fee, $25; teams of 3 from any duly organized gun club, 10 single clay-pigeons, 18yds. rise; 5 doubles, 15yds. rise; Ligowsky rules (June, 1881) to govern; the singles to be shot the first day, doubles the second day (to be followed daily by sweepstakes). The purse will be divided as follows: To the winning team the whole of the entrance fee if only 10 teams are entered; if more than 10, then to the winning team $250, and the residue to be divided into 50, 30 and 20 per cent. (if the entries be 30 or less), as second, third and fourth prizes; if over 20 entries, the residue to be divided into four prizes, viz., 40, 30, 20 and 10 per cent. If less than 30 clubs are represented, then any club may enter as many teams of 3 as it sees fit; clubs and members of teams must be of at least 30 days' standing as such. Gate money (if any) to go to management. If the gate money exceeds the expenses, we guarantee to donate said excess as special prizes at the next tournament given under our auspices. Initial entrance money will be returned unless 10 teams enter before July 9; if they do so enter, the undersigned will at once secure grounds, advertise the shoot, etc. An early reply will oblige,

J. E. BLOOM,
For the Ligowsky C. P. Co., 59 Murray street, New York City.

THE MERIDIAN GUN CLUB.

AT the tournament of the Meridian (Miss.) Gun Club, shooters were present from North Carolina, Georgia, Alabama, Louisiana and Tennessee. As will be seen by the subjoined scores, the average shooting was good. Weather fine. Affair passed off happily. Another tournament is proposed for the fall.

First Day.—First Match—5 pigeons, 20yds.: F. W. Dunham 2, W. T. Vass 5, A. E. Dunham, 2, L. P. Chaudet 4, F. A. Cousin 5, Wm. Mayronne 4, M. Daly 1, W. W. Scales 4, N. Scales 3, S. S. Scales 1, J. F. Jordan 4, J. R. DeFuents 3, J. C. George 3, F. S. Ward 4, B. Nichols 1, Jno. M. Ladd, Jr. 5, G. W. Bookout 4, H. L. Foot 3, B. Crisler 3, G. W. Tunstall 4, E. Field 3, S. M. Irion 3, N. S. Carr 3, W. H. Dobson 3, B. H. Gallup 1, B. F. Cameron 3, W. W. Stroup 3, J. T. Sargent 4, J. J. Kane 4, W. T. Dabney 4. Ties for first: Ladd missed his fourth bird. Money divided between Vass and Cousin. Ten ties for second, won by Tunstall. Eleven ties for third, won by Stroup.

Second Match—10 clay-pigeons, 18yds.: F. W. Dunham 7, B. H. Gallup 5, E. Field 6, J. F. Jordan 7, W. Mayronne 6, W. T. Dabney 6, J. M. T. Hamilton 6, W. T. Vass 10, B. Nicholas 5, W. Taylor 2, G. W. Tunstall 5, W. W. Scales 3, M. Drey 5, N. Carr 4, J. M. Ladd, Jr., 9, W. W. Stroup 5, F. A. Cousin 8, B. L. Foote 8, G. W. Brookout 5, L. P. Chaudet 8, B. Crisler 1, Sargent 5, Cameron 6, S. M. Irion 0, A. E. Dunham 7. W. T. Vass wins first and J. M. Ladd second. Ties for third won by Chaudet breaking 3, Cousin 2 and Foote 0.

Third Match—5 pigeons, 20yds.: Fields 1, Rich 4, A. E. Dunham 1, Tunstall 5, F. W. Dunham 2, T. P. Brown 2, Sargent 3, Mayronne 1, S. S. Scales 4, N. Scales 4, Foote 2, Bookout 4, Vass 5, Taylor 4, De Fuents 4, Chaudet 5, Ladd 2, Cousin 4, Jordan 5, Drey 2, Cameron 3 Dabney 5, Stroup 3, Kane 3, Ward 4, Dobson 2, Gallup 4, W. W. Scales 5, N. Carr 5, Hamilton 2. Seven ties for first won by Chaudet on third bird, the others all missing. Nine ties for second divided between Rich and Ward, they being tie after killing 9 birds on the tie shoot and proposing to divide. Four ties for third divided between Stroup and Cameron.

Second Day.—First Match—3 double pigeons, 21yds.: Cousin 2, Rich 4, De Fuents 4, Mayronne 4, Chaudet 4, A. E. Dunham 1, Gallup 1, Tunstall 1, Field 3, Stroup 6, Bookout 4, Scott 1, Ward 5, Sargent 4, Jordan 6, Vass 5, Foote 5, F. W. Dunham 3, Ladd 4, Dabney 3, George 2. Stroup and Jordan divide first money. Tie for second: Ward and Vass tie on the third pair, Foote missed second pair, Ward and Vass divide. Ties for third won by Rich on seventh pair. Score: Rich 14, De Fuents 13. Ties in double match were shot off by shooting at pairs.

Second Match—15 clay-pigeons, 18yds.: Cameron 5, F. W. Dunham 3, Vass 6, Foote 7, Mayonne 7, Bookout 8, Jordan 7, Gallup 2, Chaudet 9, Cousin 7, Hamilton 6, Dabney 7, Tunstall 7, A. E. Dunham 2, Nicholas 2, Ladd 2, Rich 1, Stroup 7, White 3, Ward 6, Brown 0, Dobson 9, Sargent 7, Kane 5, Scott 4, Drey 5, George 4. Ties on first Chaudet, ties for second Bookout on seventh ball, ties for third Cousin.

Fourth Match—5 pigeons, 26yds.: F. W. Dunham 1, Jordan 4, Bookout 4, Vass 2, Sargent 3, Irion 3, Chaudet 3, De Fuents 3, Scott 3, Tunstall 5, Stroup 3, A. E. Dunham 4, Cousin 3, Rich 3, Mayronne 3, Foote 3, Kane 4, Dobson 2, Dabney 3, Ward 4, Cameron 4, Gates 4, Coburn 2, Ladd 3. Tunstall wins first. Ties for second Cameron on third bird, others all missing. Twelve ties for third, won by Chaudet.

Third Day.—First Match—5 pigeons, 26yds.: F. W. Dunham 0, Vass 4, Foote 4, Jordan 3, Bookout 5, Gallup 3, Chaudet 5, Cousin 4, Dabney 4, Tunstall 3, A. E. Dunham 1, Stroup 4, Ward 5, DeFuents 3, Sargent 4, Cameron 3, Gates 4, W. Shackleford 4, White 3, A. McCarty 2, Irion 2, Kane 2. Ties for first won by Chaudet; for second, divided between Foote and Cousin after tieing on fifth bird, others all having missed; six ties for third, won by Tunstall.

Second Match—Pigeons, miss and out, 28yds.: Birds gave out after the third round. Money was divided between all who had killed three each. Chaudet, Scott, Cousin, Cameron, Dunham, F. W. Bookout, Mayronne, Jordan, Stroup and Ladd.

Third Match—5 clay-pigeons, 21yds. and 5 glass balls 18yds.: Cameron won first, breaking 5 clay-pigeons and 5 glass balls. Four ties for second, won by Foote. Four ties for third, won by Vass.

Fourth Match—10 glass balls, 21yds. rise.: First divided between Dabney and Foote, Jordan won second, beating Vass and Bookout on tie, and Dobson won third.

CONNECTICUT.—Match at Wallingford, June 25, for clay-pigeon individual State medal.

Folsom and Longden tied and shot at 5 pigeons five times before Longden won. The next State shoot will be in Meriden, July 9, on the grounds of the Parker Gun Club, when two sets of traps will be used.—J. F. I.

BOSTON GUN CLUB.—Shoot at Wellington, June 25.—The final shoot for the gold badge by teams of three men at the grounds of the Boston Gun Club took place yesterday, and was won by the team from the Massachusetts Rifle Association. Following is the result of the other events:

First event, 5 birds, 5 traps:

M W Eager	10111—4	G B Clark	11101—4
W S Perry	11011—4	H L Prescott	01111—4
G A Sampson	11101—4	D Kirkwood	11111—5
C H DeRochmont	10010—2	G G Tidsbury	11010—3
B F Johnson	01111—4	A F Cooper	11010—3
O J Jenkins	11011—4		

Kirkwood first, Perry second, Cooper third, DeRochmont fourth.

Second event, 3 pair doubles:

Sampson	11 11 11—6	DeRochmont	10 01 01—3
Perry	11 11 01—5	Jenkins	10 00 11—3
Kirkwood	11 11 01—5	Cooper	10 11 00—3
Eager	11 01 01—4	Clark	11 10 10—4
Prescott	11 10 11—5	Johnson	10 11 00—3

Sampson first, Kirkwood second, Clark and Eager third.

Third event, 7 single birds:

Perry	1011101—5	Cooper	1111010—5
Jenkins	1111111—7	Tidsbury	0111111—6
Kirkwood	1101011—5	Prescott	1110110—5
Sampson	1110111—6		

Jenkins first, Sampson and Tidsbury second, Perry third.

Fourth event, 3 pair double birds:

Perry	11 10 11—5	H H Francis	11 01 01—4
Eager	11 10 11—5	E W Law	11 11 11—6
Prescott	11 11 10—5	A L Brackett	10 10 01—3
Sampson	10 11 11—5	J S Sawyer	10 11 10—4
Johnson	10 10 11—4	T Curtis	11 11 00—4
Kirkwood	10 11 00—3		

Law first, Perry second, Francis and Johnson third, Brackett and Kirkwood fourth.

Fifth event, 5 single birds, 5 traps:

Jenkins	10010—2	Sawyer	01010—2
DeRochmont	11001—3	Johnson	11101—4
Sampson	10101—3	G F Cutting	10100—2
Eager	01111—4	G W Tinker	10101—3
Clark	11111—5	Cooper	11010—3
Law	11000—2	Tidsbury	10111—4
Perry	01111—4	Francis	00101—2
Brackett	01100—2	Prescott	10010—2

Clark first, Tidsbury second, Tinker third, Francis fourth.

Sixth event, 7 single birds, 5 traps:

Perry	1110111—6	DeRochmont	1001111—5
Jenkins	1011110—5	Law	1101111—6
Prescott	1110101—5	Cooper	0111111—6
Johnson	0011111—5	Francis	1011111—6
Eager	1111001—5	Sawyer	1011111—6
Sampson	1011110—5	Cutting	1011110—5
Tinker	1111101—6	Tidsbury	1111111—7
Clark	1111000—4		

Tidsbury first, Cooper second, DeRochmont and Sampson third, Clark fourth.

Seventh event, 7 birds:

Francis	1110111—6	Jenkins	1011111—6
Sampson	1001101—4	Clark	0111110—5
Perry	1111111—7	Johnson	1110110—5
Eager	1110111—6	Tinker	0101011—4
Law	1100011—4	Tidsbury	1101110—5

Perry first, Eager second, Tidsbury third, Tinker fourth.

Eighth event, 7 birds:

Eager	1111111—7	Law	1011110—5
Jenkins	1110111—6	Kirkwood	0011111—5
Perry	0011110—4	Tinker	1111100—5
Cooper	1000111—4	Francis	1110111—6
Sampson	0011110—4	Tidsbury	1111111—7

Monies divided.

Ninth event, 5 single birds, 5 traps:

Francis	01101—3	Perry	11111—5
Tinker	10110—3	DeRochmont	10101—3
Sampson	10111—4	Jenkins	11011—4
Johnson	11010—3	Prescott	00110—2
Clark	10111—4	Cooper	11100—3
Tidsbury	11011—4	Law	01110—3
Sawyer	11101—4	J Williams	01111—4
Cutting	10100—2	Kirkwood	01011—3
Eager	11111—5		

Eager and Perry first, Sampson and Clark second, Tinker, Law and Cooper third, Cutting and Prescott fourth.

Tenth event, 3 pair doubles:

Francis	10 10 11—4	Tinker	11 11 11—6
Cooper	01 10 11—4	Johnson	01 11 11—5
Jenkins	11 10 10—5	Sampson	11 01 00—3
Eager	11 11 11—6	Law	10 10 01—3
Perry	11 10 01—4	Prescott	10 10 11—4

Eager first, Johnson and Jenkins second, Perry third, Sampson fourth.

Eleventh event, 5 straightaways:

Stanton	01010—2	Francis	11011—4
Nichols	11010—3	Williams	10110—3
DeRochmont	10101—3	Jenkins	01011—3
Tidsbury	01010—2	Eager	10001—2
Sampson	11010—3	Law	11101—4

Francis and Law first, Nichols and DeRochmont second, Tidsbury and Eager third.

Team match for gold badge.—Conditions—Open to any organized club in the New England States. Teams of three men, score to consist of 5 single birds from 5 traps, 3 pair double birds and 10 single birds from single trap, per man:

Boston Gun Club.			
Johnson	11001	11 00 00	0111111111—14
Kirkwood	01010	10 10 11	0101110011—12

Tinker	11011	01 10 11	1100111111—16—43

On July 9, a grand tournament will be held of the above club, when a gold medal will be given free. Conditions—2-men team, 7 singles from one trap, 7 singles from 5 traps and 3 pair doubles, open to all New England. This will be upon the same date that the New England Trap Shooters' Association will meet at Young's Hotel, Boston.

THE FINAL SCORE.—The members of the disbanded Long Branch Gun Club met at the old grounds, Deal Beach, N. J., to shoot for the possession of the Riverton Gun Club cup, won by the club at the Philadelphia meet in 1883. Conditions: Open only to members of the late Long Branch Gun Club; 10 birds each, 5 traps, handicap rise; Long Branch Gun Club rules. Closed with 16 entries:

W D Campbell, 27yds	1111111111—10
J S Hoey, 29yds	1110111111— 9
Gilbert Speir, 30yds	1111110111— 9
C N Skirm, 28yds	1111110111— 9

Dr Zelner, 30yds	0101Ow

It is reported here that the purchase of the effects of the club, a large club building and almost a mile of high board fence which inclosed the grounds, by Miles L. Johnson was in the interest of several gentlemen members of the old club, who design to form another shooting club immediately.

TORONTO, Ont., June 21.—A clay-pigeon match took place at Woodbine Park yesterday and this afternoon, when a number of valuable prizes were shot for. The first prize was a breechloading shotgun, and was won by Mr. J. R. Humphreys. The shoot was at 15 birds, 18yds. rise, from two screened traps. Mr. George Smith was referee. The following was the score of the winners:

J R Humphreys	101111111111111—14	W McDowal	1011111111111011—13
J Townson	1110111111111111—14	R Harris	1011111111100111—12
J L Rawbone	1101111111111110—13	W Roberts	0110110111111110—11
F Martin	1111110111101111—13	H Humphreys	0101111110011111—11

First Tie—J. E. Humphreys 5, J. Townson 4. Second Tie—W. McDowall 4, J. L. Rawbone 2, F. Martin 2. Third Tie—Rawbone 3, Martin 2.

SAN FRANCISCO, June 15.—To-day has been a very favorable one to the bird and target men. A number of the lovers of pigeon shooting met at Birds Point and shot at twenty-five birds each; the prizes being $50 for the first, $40 for the second, $30 for the third and $10 for the fourth. The entrance fee was $10. The shooting was good, Mr. Brown missing only one bird and the gentleman shooting under the name of Jackson only two. Mr. Lambert killed twenty-one, and four out of the remaining five killed twenty each. On the shooting off for fourth prize, Mr. Pearson won with nine kills without a miss. Appended is the score. Next Sunday there will be another shoot at Birds Point, but it is not decided yet whether it will be at fifteen or twenty-five birds. The entrance will be $10.

Fisher	0011111011011111011111111—20
Lambert	1111011111111011101111110—21
Pearson	1111111111011011011011110—20

After this, six gentlemen entered for a sweepstake of $2.50 each at six birds, Mr. Slade taking first money, with a clean score, and Messrs. Fisher and Coffin tying for second, with five each.

The Lincoln Gun Club held its monthly shoot at Colon. The following is the score:

First Class.		Second Class.	
Bruns	1111110111111000—11	Cohen	1011101110110111—11
Heine	1101111010101111—11	Schendel	1001101110110111— 9
Edlar	0111111110001111—11	W Norton	0011101110110011— 9
F Venker	1101011010100111— 9	Karney	1111101011111111—13
Potter	1111100101011010—10	H Norton	0000101111111110— 9
Richter	1101010111111011—11	Frisch	1010111111011110—11
Parks	1100101111111011—11	Seyden	1110011111011111—12
H Venker	1101111101010100—10	Ford	0111111010011010—10
Drinkhouse	1011101110001111—10	Jones	1111100100000010— 7
Johnson	1010011111111001—10	Weymer	0010000000011011— 4
Smith	1001110010111010— 9	Christel	1011010110000111— 9
Baker	1111101010100000— 8		

Messrs. Bruns, Heine, Edlar, Richter and Parks tied on eleven birds each, and shot off at 3 pair double birds. Messrs. Bruns, Heine and Edlar again tying, with 5 birds each, and again shot off at 3 pair more double birds, Mr. Edlar taking the medal in the first class and Mr. Karney in the second.

MALDEN GUN CLUB.—The club had a field day at Wellington on the 28th ult., the leading events being the close of the shoot for the class medals. The winners were: Fielding first, Nichols second, Scott third. The other events of the day were as follows:

First event, five birds—Sanborn and Shumway divided first, Snow second, Brown and Field divided third.

Second event, five balls—Snow, Brown and Hopkins divided first, Ellsworth second, Adams third.

Third event, three pair doubles—Hopkins first, Field and Brown divided second, Pratt third, Scott fourth.

Fourth event, five birds—Hopkins first, Snow and Scott divided second, Brown and Pratt divided third, Field fourth.

Fifth event, three pair doubles—Field and Pratt divided first, Snow and Hunter divided second, Scott third.

Sixth event, three pair doubles—Dickey first, Field and Snow divided second, Hunter third.

Seventh event, five birds—Snow first, Dickey second.

Eighth event, five birds straightaway—Hopkins and Field divided first, Short second, Shattuck third.

Ninth event, miss and out—Dickey first, Snow second.

Tenth event, miss and out—Dickey and Pratt divided first, Scott second.

Eleventh event, five birds—Wiswell and Brown divided first, Dickey and Field divided second, Hunter third, Scott fourth.

Twelfth event, miss and out—Snow and Scott divided first, Merrill second.

Thirteenth event, miss and out—Dickey first, Snow second.

Fourteenth event, miss and out—Dickey first, Scott second.

Fifteenth event, miss and out—Dickey first, Pratt second.

Sixteenth event, ten birds—Nichols first, Brown second, Adams third.

Seventeenth event, same—With same winners.

Eighteenth event, five birds—Dickey first, Pratt, Sanborn, Snow and Brown divided second, Hopkins third, Short fourth.

Nineteenth event, five balls—Snow and Dickey divided first, Ellsworth and Field divided second, Shattuck and Adams divided third.

Twentieth event, five balls—Shattuck and Ellsworth divided first, Short and Brown divided second, Field, Edwards and Pratt divided third.

Twenty-first event, five birds, straightaway—Hopkins and Dickey divided first, Short second, Shattuck and Merrill divided third.

The annual shoot of the club will be held Friday, July 4, at 8:30 A. M. There will be a shoot for two medals, one of gold, the other leather, for the best and worst shots. The medals are to be shot for at every regular shoot during the year, and are to become the property of the member winning them the greatest number of times. In addition there will be four events, at which the club will offer special prizes.

CLAY-PIGEON TOURNAMENT.—The Second International Clay-Pigeon Tournament, under the auspices of the Ligowsky Company, will be held at New Orleans, La., during Mardi Gras week, in February 1885.

PORTLAND, Me., June 27.—The sixth contest for the Ligowsky medal, held to-day, terminated in favor of the Willard Club by 4 birds, the score standing 80½ against 76½. These two scores are the highest that have been made in any match since the tournament held here in April last. The singles are thrown at 18yds, rise and doubles at 15yds., all from 5 traps 3yds apart, and direction of each trap changed as it is refilled. A challenge has been received from the Bethel Club and accepted.

Willard Club—Portland.

	Singles.	Doubles.

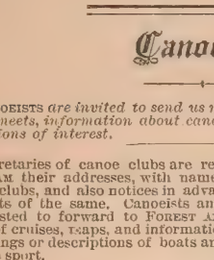
T. B. DAVIS, Referee.

Canoeing.



CANOEISTS are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

July 4, 5, 6.—Rondout C. C., Camp at Esopus Island.
July 9 to 15.—Chicago C. C., Annual Cruise.
July 14.—Allegheny C. C., Cruise at Conneaut Lake.
July 19.—Chicago C. C., First Annual Regatta.
July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 15.—A. C. A. Meet, Grindstone Island.

OSHKOSH C. C.

COMMODORE, A. M. Kaas; Vice-Commodore, F. H. Gary: Secretary, W. J. McKoy; Executive Committee, W. Sessions, Otto Schloerb. Organized March 22, 1884. Signal, pointed burgee, blue field with white letters.

RACES AT LOWELL.

THE annual regatta of the Vesper Boat Club, held on the Merrimack River at Lowell, Thursday evening, June 26, included two canoe races, which developed quite as much enthusiasm as the rowing contests. The first was for single canoes, with double-bladed paddle. Course, one-half mile, with turn. Four canoes entered and paddled a pretty race, all keeping well together and finishing as follows: Howard Gray, Stella Maris, first; Paul Butler, open cedar, second; Frank H. Pullen, Birdie Kane, third; Joseph Leatham, Stella Maris, fourth. Time, 5m, 52s.

The second race was for open tandem canoes, using single blades. The club ought to have turned out at least ten canoes in this class, but most of their owners foolishly declined to enter for fear of defeat, and only two crews contested, the leaders having it all their own way and paddling a splendid stroke. Course, one-half mile, with turn. Result as follows: E. S. Sherman and C. P. Nichols, Adirondack, first; J. C. Davis and Howard Gray, Peterborough, second. Time, 5m, 10s. There were no sailing races. After the regatta there was a pleasant reception in the boat house, which was tastefully illuminated. Dancing from 8 till 11.

THE MEET AT GRINDSTONE ISLAND.

IN FOUR weeks more the fifth annual meet of the American Canoe Association will be held at Grindstone Island, in the St. Lawrence River, and it will, without doubt, exceed in size any previous one. The spot is the most beautiful as well as the most central yet selected, near to Canada, a day's ride from New York and the East, and readily accessible by way of the lakes from the West. Those who have attended previous meets are certain to be present this year, if possible, as well as many who have lately joined, but besides these there are a large number to whom the meet offers every opportunity for a cheap and pleasant vacation.

Although firmly established in the Middle and Eastern States, the Canoe Association, as yet, numbers few members in the West, while its aims and objects are but little known to outsiders not interested in canoeing. The former class, considering the distance too great to attend the meet, have heretofore held aloof, declining all invitations to join the Association, and have gone on alone without any union among themselves. Of course, it is impossible, even in these days of fast travel, for them to come to an Eastern meet every year, or for Eastern men to go far West, but they need not keep out of the Association for that reason. We have in the present Canoe Association a well-organized machine for the collection and exchange of such knowledge as is indispensable to all cruisers, whether by canoe or other craft, which machine is willing and able to extend its labors to any locality willing to render help in turn, and if the Western canoeists will but join, the services of the secretary are as much at their disposal as with members nearer to him.

As concerns the meet, a plan has already been decided on of dividing the Association into several sub-divisions of convenient size, each owing allegiance to the general government, but having its own funds, local self-government and officers, and annual meet, the offices going to each division in rotation, while each meet will, in turn, be the main Association meet, at which the officers will be present, and all business transacted.

By this plan all will be equally represented, each locality having a meet of its own, attended by some members from other divisions as well, thus securing an interchange of ideas and a further binding together of the different divisions. Each division would have to contribute its proportion toward such general expenses as the publication of the annual book, beyond which they would manage their own finances and be independent of the other divisions.

This plan can be put into operation at any time, but the proper occasion to introduce it will, of course, be at the business meeting at the camp. All that is needed is for Western canoeists to take the matter up, let them be as fully represented as possible at Grindstone Island, where the entire matter can be discussed and settled. Every club, large or small, no matter where located, should endeavor for its own sake, to have one delegate at the meet, who will go there to represent the club, and who will be prepared, on his return, to report to the club what he has seen; canoes, rigs, fittings, all those numerous details brought out by so large a number camping together, and this is most important to the younger clubs in the smaller cities, who have little opportunity of knowing what is being done by canoeists generally.

Besides active canoeists there is another class to whom the meet is open, but who as yet have availed themselves but slightly of the privilege—those who, though not canoeists, are fond of camping and wish to spend a short vacation in the woods. Every year a few strangers visit the camp by accident in this way, and some of them have become enthusiastic canoeists. All such are heartily welcome; there is room for them, and to them the A. C. A. camp offers peculiar inducements. No guides are necessary, the expenses are but trifling and there is less of the drudgery and hard work of roughing it in a large camp organized as this one is than where a small party go into the woods alone, a very important consideration to amateurs whose experience is confined to a week or two every year, and who are unfitted to bear the hardships attendant on camp life in the wilderness. All such are heartily welcome to the camp. Whether canoeists or not they will meet with a cordial reception, and we hope to see plenty of new faces next August.

A RIVER AND COAST CRUISE.

LEAVING Deer Leap camp at the breaking up of the Merrimack River canoe meet, Monday morning, June 16, canoes Chemaun and Clytie, A. C. A., cruised around to Salem, via Merrimack and Plum Island rivers, Ipswich Bay, Squam River and Canal, Atlantic Ocean and Salem Harbor. The trip occupied three days and proved highly enjoyable, notwithstanding the fact that head winds were encountered all the way after leaving Newburyport, and much of the distance was paddled against adverse tides, while a heavy sea was running along the coast as the result of continued southeast winds. Of the canoes one, an Everson Nautilus of 32-inch beam, was strictly a salt-water boat, having cruised extensively on the open ocean, and carried two large lateen sails of a most beautiful pattern and admirably suited to rough water. The other, a smaller and lighter Birdie Kane of 27-inch beam, was also rigged with two small lateens and proved quite as steady on the open sea as on the calmer waters of the river at home. Like all Racine boats, she was, of course, strong and tight. Both carried canoe tents and afforded very comfortable sleeping quarters at night, while the model cooking outfit of the former and the camera which accompanied the latter also added to the pleasures of the cruise.

The six miles to Lawrence were traversed leisurely under sail, in company with a Stella Maris, which had a loaded open canoe in tow, and a double cruiser bound for Haverhill. Persons familiar with the river below Lowell need not be told of its beauty; wooded bluffs, alternating with open reaches and everywhere abounding in the picturesque to a marked degree. At Lawrence there was a stop of over an hour, to repair damages sustained in running Hunt's Falls, and inspect the fishway at the dam.

The lock at the entrance of the northern canal was entered shortly after noon, and of course the three canoes attracted much attention from persons in and about the mills. Three more locks at the end of the canal lowered the boats a good many feet, and they finally emerged upon the river with a clear course to the sea. The wind now became fickle and squally, but sails were hoisted and occasionally proved of service. Two or three miles were passed, when suddenly a splash was heard, and the two leading canoeists turned to see their Haverhill friends climbing over the side of their canoe with an evident desire to inspect its keel. They had unwisely fastened the sheet of their sail and when struck by a squall capsized. But they were soon towed ashore, wrung out, put together again, and the fleet proceeded under paddle, with a hearty laugh all around.

Running Mitchell's Falls afforded some fine sport—swift water with little danger of striking rocks—and the canoes were soon down to the limit of tide-water. Sails were again hoisted, after a refreshing drink at a cooling spring, and the fleet advanced in good style. Arriving there, good-bye was said to the moistened crew of the Gyp, and the other two canoes sailed on side by side, catamaran fashion, to Groveland Bridge, where milk was procured and a lovely camp ground selected just below at an early hour. A grassy bank, sheltered by stately trees and commanding a fine view of the river up and down, offered an inviting resting place for the canoes, which were quickly hauled out, propped up side by side, and the little canoe tents pitched over them. Supper over, there was time to loll about and chat with a couple of visitors before dark, after which came sound and refreshing sleep in the canoes.

During his brief stay at the canoe meet, Mr. John Boyle O'Reilly, who has done considerable canoeing, in addition to seeing a great deal of the world in other ways, let fall a remark which sounded the keynote to the whole sport of canoeing. "Canoeists," he said, "should never be in a hurry." And to this may be added the advice, camp early. There is always a temptation, when on a cruise, to keep on and add a few more miles to the day's score. But it doesn't pay. Darkness and dampness quickly gather; preparations for the night are hastily made, and the result is neither satisfactory nor enjoyable. Five, or six o'clock at the latest, should find the canoeist settled in camp, with ample time to cook and eat his supper and arrange for turning in. Those who habitually put up at hotels or farm houses may discard this advice, but they are always at the mercy of others, and lose much of the charm of canoeing. Mention has already been made of the model cooking outfit carried by the Chemaun. To this and its skillful manipulation by the skipper was due much of the pleasure of the cruise. The little stove, which everywhere attracted attention, was made of sheet iron, hinged to fold flat and stow away into a small sack. When set up with funnel attached a very little wood served to quickly cook a meal, three holes on top accommodating pot, kettle and frying pan all at the same time. Then the cooking utensils, plates and cups were all of granite ware, which will not rust and is easily kept clean, while the cooking ingredients were held by glass jars, fitting compactly into small boxes—the whole complete, convenient and portable.

Tuesday morning opened fair, with promise of a delightful day. In fact, the weather throughout the trip was all that could be asked by the most fastidious. The camp was photographed, breakfast eaten, and at 7:30 the canoes set out under paddle with a favorable tide. Everywhere the scenery was fine, and the river gradually widened as it proceeded. At Pleasant Valley there was a stop for a swim, and from this point the fleet proceeded under sail. The old chain bridge was photographed from Eagle Island, and shortly after the canoes pulled up at a wharf in Newburyport, while their occupants went ashore. Once more afloat, lunch was eaten in the canoes, while sailing on to the mouth of the river. Arriving there an attempt was made to cross the bar and run down the coast outside of Plum Island, but a strong tide had by this time set in, and although Chemaun succeeded in getting pretty well out, Clytie gave it up after trying vainly for twenty-five minutes, and the two paddled back to the entrance of Plum Island River. The tide was now favorable, but wind dead ahead, so that paddling was hard work, and it was nearly dark when the canoes were finally worked around to their destination on Ipswich Little Neck. The course inside of Plum Island was through a pretty stretch of level marsh on one side, with hills of sand on the other, while nearly all the way the surf could be heard breaking on the beach outside. The last half mile was paddled against the tide at the mouth of Ipswich River, and the paddlers were prepared for a solid sleep in a summer cottage owned by the captain of the Chemaun.

Starting early on the following morning, the canoes were soon out side, past Ipswich light and tossing on a ground swell in the bay. Sails were set, but the light wind was still dead ahead, and a "spruce breeze" became again in order. Coasting along within a half mile of shore, and sighting occasional seals, Cape Ann loomed up in the mist ten miles away at the left, and after crossing the mouth of the Essex River, course was laid for the Squam, where a strong ebb tide lent aid to the wind in opposing progress and frequent shoals were encountered. Squam River is at times a pretty stream, winding a devious course between rocky shores capped by summer cottages, but at low water it dwindles to a mud flat, and the voyager who strikes it when the tide is nearly out is sure to come to grief. So it happened in this instance, and after a hard passage, with frequent grounding, the canoes were at length hauled out on a float at the first bridge and left to await the turning of the tide. A two hours' wait followed, admitting of a walk to Gloucester and dinner in town.

By 2 o'clock the water had risen a little and was steadily deepening by the incoming tide, but it still failed to float the canoes, and they were dragged to the entrance of the canal connecting Squam with Gloucester harbor. Here a tremendous tide rip had to be stemmed, and the passage through was slow and tedious. Following came a pleasant paddle across the harbor, passing Stage Head, Field Rocks and Muscle Point, and going outside of Norman's Woe Rock. When off Eastern Point and fairly out of the harbor the canoes were on the open ocean, and found a heavy sea running, the result of a southeast wind which had been blowing for several days.

This was the Clytie's first experience in rough water and lying in the trough it was necessary to head her up to each roller as it came on. But she rode them buoyantly and shipped less than a pint of water while on the open sea. Chemaun kept well out, with sails set, but both settled down for a hard ten miles' paddle along the coast in a broiling sun. The waves were beating high against the rocks, but outside the rollers only needed attention. Ketule Island and Great Egg Rock were left to starboard and the course continued past Magnolia and Manchester-by-the-Sea, the great Masconomo House forming a striking landmark at the latter place. At last the Clytie, which had kept well in and led thus far, worked in behind House Island, at the mouth of Salem Bay, just as the wind began to freshen, but going outside of Little Misery she got into a stronger wind which kicked up a nasty sea. The skipper was soon wet from the shoulders down and water began to come aboard pretty fast, but a few vigorous strokes put the canoe around a point into calmer water just as the other craft came up inside. The crew of the Chemaun seemed fresh and quite at home, but his companion was tired, wet and a bit discouraged, so both concluded to run around under the shelter of Great Misery Island and camp for the night rather than put in four or five miles more hard paddling up to the city. A quiet harbor was found, when the canoes were beached, hauled up and unloaded. Then the voyagers called at the house of Mr. Daniel Neville, a genial old gentleman who lives on the island, and came away with milk and eggs for which the host generously refused payment. Quite a party, including several fishermen, came down from the house to inspect the boats, in which they took a lively interest, and before supper was over the twin lights flashed out from Baker's Island. It had been proposed to sleep in the canoes but the offer of comfortable beds in the loft of a fish-house was accepted instead and all hands turned in.

Half-past three Thursday morning found preparations under way for an early start, and before 5 o'clock the canoes were headed up the harbor. A few boats were already out. Skirting along the north shore there was opportunity to see and appreciate the beauties of Beverly Farms, located on one of the finest bits of coast in the world. Everywhere the waters dash against ragged rocks on the crests of which stand costly residences amid beautiful grounds and supplied with all the luxuries which wealth can buy. Paddling leisurely on, Beverly light was left behind and one of the canoes crossed over to make a short call at the Willows. Continuing through Beverly Harbor, under the bridge and around into the North River, the canoes were finally landed in the boathouse at 7 o'clock, having completed a combined fresh and salt-water cruise of some seventy-eight miles without accident of any kind and furnished the means for a pleasant outing to both their crews. CLYTIE.

ANOTHER MOHICAN CHAMPION.

SATURDAY afternoon, June 28, at 5 o'clock, the first race was called for the new challenge prize offered by Capt. R. W. Gibson to his club—a silver badge, designed by him and executed by Burgess, of Albany, showing a canoe with a large lateen sail surrounded by a circle, and hung to a bar, with the word "champion" engraved on it, and the monogram M. C. C. A small white streamer goes with it to be carried at peak so long as it can be kept. Considerable interest is shown in the prize and the contests will be very keen, although business engagements prevented several entries in this, the first race. Sail is limited to 75ft., ballast to 75lbs.; course about three miles, triangular or to windward and return; A. C. A. sailing rules; to be sailed in two hours or no race; winner not to be compelled to sail on another challenge in less than a month.

The Snake did not enter, her owner acting as judge on this occasion. The entries were: Thetis, P. M. Wackerhagen; Lasca, George H. Thacher; Uncas, Henry R. Pierson, Jr.; Fior da Lice, B. Fernow. The start was made at 5:09½, with a light south wind, and the first stretch to the north was against the last of the ebb tide. The course selected was up from the upper bridge to the second buoy and return, a little short of three miles. Thetis and Lasca alternately led up, the latter rounding the buoy first by about one minute. Coming to windward, however, Thetis got in front, making long tacks from shore to shore, while Lasca, having found a stream of breeze on the west side kept in it by judicious short tacks and soon came to the fore again. Uncas was close behind until the windward work began, when the greater experience of her antagonists enabled them to make a duel of it. Thetis lost all her advantage about half way back and Lasca came in prettily at 6:32:45, Thetis 6:34; Uncas was a good third and Fior da Lice retired early in the race.

Before the finish eight or ten canoes had got out and the river was gay with white wings. Mr. Van Vechten had his new Rushton afloat, a very fine Ellard, the latest arrival. There was "considerable thinking" over the result, we had all thought that Thetis, the Newburgh winner, had an easy task. Mr. Thacher has been making such a dude boat of the Lasca, with nickle plating where other Mohicans have brass, and screw clamps where we have bits of string, that we had adjudged him the ornamental duties, still he gave us a warning of what was coming the first day he was out with us, with a No. 8 lateen in a squally west wind. The Lasca carried a batten settee like the Snake's, 52ft. and about 14ft. in dandy; Thetis a trifle more. This shape sail is a favorite already, and seems likely to check our hitherto continuous experiments. Another Mohican is ready to carry the turtle to the front and half a dozen are waiting for the next chance to prove him. SNAKE.

A LONG CRUISE IN A SMALL BOAT.

"I BUILT that boat myself in Sanford, Florida, last December, and since then have traveled fully 2,000 miles in it. I have lived and slept in it, and there is the sleeping apartments of myself and crew." As he said this the speaker pointed to two small covered apertures on each side of the centerboard of a cat-rigged batteau lying at Waters's wharf. The batteau was but 19ft. long and 4ft. 10in. beam. "She draws 7in. light, but when we are in she goes down to 11in.," continued the speaker, who was Mr. George Ilis, a builder, of Akron, O., who went to Florida last fall to escape the rigors of a Western winter. He was accompanied by Walter Scott, of Mystic, Conn., who was sailing master of the frail-looking craft, in which Mr. Ilis, Scott and a *Sun* reporter stood yesterday, with barely room to turn around in the stern sheets.

Mr. Iles gave *The Sun* reporter an interesting account of his travels. "In Florida," said he, "transportation lines are few and far between, and specially so if you desire to thoroughly penetrate the interior waterways with which the State abounds. It was because of this that I built this boat. I started from Sanford last December, and followed the St. John's River to Lake Harney. I then had the boat hauled overland a distance of eighteen miles to the Indian River, which runs parallel with the ocean. I struck the Lucia River, and thence through Jupiter Sound to Jupiter Inlet. There I procured the services of a half-breed Indian to pilot me through the Everglades, a distance of twenty-eight miles, to Lake Worth. Progress was slow, for we had to pole all the way. I spent three delightful weeks at Lake Worth in the month of January, where we were daily regaled with ripe tomatoes, cucumbers and other vegetables. I returned by the same route to Rock Ledge, on the Indian River, and again I had the boat carted three miles across the country to Lake Poinsett, the head of navigation on the St. John's River and 105 miles from Lake Harney. The only inhabitants of that station were alligators. Not a person or animal were to be seen in that vicinity. I then returned to Sanford. I again left it on March 14 for Baltimore. The St. John's River was followed to the bar, and after passing through Mud and Nassau sounds I arrived safely at Fernandina. I then skirted the coast to Cape Roman, in South Carolina, and then had 150 miles of the open sea to contend with. Of this stretch we made 76 miles in one day. We crossed heavy breakers at New Topsail Inlet, which was the most dangerous of our whole experience, but were repaid by a good haven inside the mouth of New River. Passing through Pamlico and Albemarle sounds we entered Dismal Swamp Canal and reached Norfolk. On the route we spent several days at a time in various places, sometimes windbound or making investigation of the country."

Mr. Iles will sell his boat here and leave for his home in Akron tomorrow night. He has on board some beautiful specimens of preserved pelicans, water turkeys, cormorants, ivory bills, curlews, pyles and loons, all of which he will have stuffed upon his arrival home. He has besides many curiosities gathered on his long trip.—*Baltimore Sun.*

ROYAL C. C.—The annual long paddling race, from Teddington to Putney, took place on Saturday last. The entries were S. Fulcher and Claud Scott. Scott took the Middlesex shore, and they got off to a very good start. Fulcher was first to show in front, and at Eel Pie Island was about clear. The pace then became very hot, and Scott drew up once or twice, but could not get level, and Fulcher passed Richmond Bridge several lengths to the good. At Isleworth Scott had somewhat improved his position, but it was his last effort, as in Zion Reach Fulcher drew rapidly away, and was about one hundred yards ahead at Kew Bridge. Before reaching Barnes Bridge Scott gave up, and Fulcher paddled to the Thames Boat House alone, reaching there at 5:10 P. M. The wind was ahead in nearly all the reaches, and especially strong in Zion Reach and off Chiswick. On Saturday, the 21st inst., there will be a special race for cruising canoes, when, with a view to bring out the all-round qualities of the craft, one-half of the course will be sailed down wind, and the remainder paddled back to windward. It is hoped that all members having canoes of this class will endeavor to enter for this event.—*London Field, June 14.*

N. Y. C. C.—The race for class A canoes that was not finished for lack of wind on June 21, was sailed on June 28, over the same course. Of the three entries, Mr. Burchard was absent, and the water was too rough for Mr. Fraser's little open canoe, so Mr. Munroe, in the Psyche, had a sail over. About fifteen members will go to the August meet, by way of the Ontario and Western Railway. The new uniforms of the club will soon be ready. They are of a very dark green; Norfolk jacket, knickerbockers, long stockings, and hat of one color. Mr. Burchard, of the Siren, will shortly start on a long cruise with Mr. Stoddard. A series of races are talked of for the summer and fall, both sailing and paddling.

PELICAN C. C.—On June 14, thirteen members of the Pelican C. C. with two visiting men, met at Weirs, N. H., and launched their six canoes in Lake Winnepesaukee. They paddled to Manchester, camping out nights and doing their own cooking. At Manchester all the party went home except two Eastern members, who continued on to Haverhill, Mass., camping one night at Deer Leap Falls, the scene of the Merrimack River meet of the 14th and 15th. The members of the Vesper Boat Club were very kind to the two Eastern members, and received them with a cordiality entirely unexpected among strangers. —WENONAH.

DOWN THE CONNECTICUT.—Messrs. L. R. Ingraham and L. Q. Jones, both of the Hartford C. C., arrived here at 7:45 P. M. Sunday in Mr. Ingraham's canoe, the Rambler. They left Hartford at 4 P. M. Saturday, staying over night at Essex. The canoe is 16ft. long and carries two lateen sails, anp is as trim and pretty a craft as one often sees afloat. They hauled her out and stowed her away at Capt. Kelly's boat house, where she is to remain for a few days while Mr. Ingraham takes a trip inland. Mr. Ingraham is connected with the Gatling Gun Company of Hartford.—*New London Day, June 30.*

NEWTON BOAT CLUB.—At the annual regatta of this club on Saturday, June 28, rowed on the Charles River, at Boston, there were two races for canoes, one for birch barks, in which F. T. Burdett and W. W. Cole paddled against J. M. Jennison and Thos. Cotter, distance one mile. The former crew won after a close race, in 11m. 39s. In the Rob Roy race J. Fanning won, beating E. N. Markham, Fred Hervey and Otto Jost.

PERSONAL.—Capt. S. D. Kendall is building several boats of various kinds at Tarpon Springs, Fla. One of his latest is a sharpie, 33ft. over all, 8ft. 10in. beam, 18in. draft; 900ft. of canvas in lower sails, yawl rig.

CHICAGO C. C.—Two gold badges have been presented to the Chicago C. C. as prizes for their races of July 19. All the boats of the club will be entered.

Yachting.

FIXTURES.

Secretaries of yacht clubs will please send early notice of proposed matches and meetings.

July 4.—Beverly Y. C., Monument Beach, Sweepstakes.
July 4.—Larchmont Y. C., Annual Open Matches.
July 4, 5, 6.—Quaker City Y. C., Corinthian Cruise.
July 4.—Hull Y. C., Review and Annual Cruise, five days.
July 4.—Boston, open matches, City Point.
July 5.—Beverly Y. C., Monument Beach, Championship.
July 9.—Beverly Y. C., Marblehead, First Championship.
July 12.—Boston Y. C., Second Club Match.
July 12.—Hull Y. C., First Club Match.
July 19.—Hull Y. C., Ladies' Day.
July 24.—Eastern Y. C., Annual Cruise.
July 26.—Beverly Y. C., Nahant, Second Championship Match.
July 30.—Quincy Y. C., Third Match.
Aug. 2.—Hull Y. C., First Championship.
Aug. 4.—Quaker City Y. C., Review and Harbor Cruise.
Aug. 9.—Boston Y. C., Annual Matches.
Aug. 11-25.—Quaker City Y. C., Annual Cruise in Chesapeake and Delaware Bays.
Aug. 16.—Salem Bay Y. C., Open Matches.
Aug. 16.—Hull Y. C., Open Matches.
Aug. 23.—Boston Y. C., Third Club Match.
Aug. 23.—Beverly Y. C., Open Match.
Aug. 26.—Beverly Y. C., Special, Marblehead.
Aug. 28.—Quincy Y. C., Fourth Match.
Aug. 30.—Hull Y. C., Second Championship Match.
Sept. 3.—Hull Y. C., Third Championship Match.
Sept. 4.—Salem Bay Y. C., Second Championship Match.
Sept. 6.—Beverly Y. C., Marblehead, Special Match.
Sept. 11.—Quincy Y. C., Last Race.
Sept. 11.—Brenton's Reef Challenge Cup.
Sept. 13.—Boston Y. C., Ladies' Day.
Sept. 13.—Boston Y. C., Fall Matches.
Sept. 14.—Quaker City Y. C., Review and Cup Race.
Sept. 28.—Quaker City Y. C., Review and Harbor Cruise.
Oct. 5.—Quaker City Y. C., Closing Review and Cruise.

BEVERLEY Y. C.

THIS club has arranged the following series of matches for the summer: July 4, Monument Beach, open catboat sweepstakes; July 5, Monument Beach, first race for Buzzards Bay championship; July 9, Marblehead, first championship regatta; July 26, Nahant, second championship regatta; Aug. 16, Swampscott, third championship regatta; Aug. 23, Marblehead, (probably) open matches; Sept. 6, Marblehead, fall matches. The dates of the open regatta at Monument Beach and the last two races for the Buzzards Bay championship are not yet decided upon.

The first of the above—an open sweepstakes for catboats only—will be sailed on Friday, July 4, off Monument Beach, starting at 12 M., under the following conditions: Entrance fee, $5 for each yacht. All entrance fees, after deducting expenses, will be distributed in first and second prizes. Second prizes will only be awarded where more than two yachts start. These prizes will be sailed for with the time allowance, and under the rules of the New England Yacht Racing Association. The start will be flying, yachts crossing a line between the judges' yacht and Tobey Island buoy, No. 2. Four guns will be fired for the start, at intervals of five minutes. The first, a preparatory gun, at 12 o'clock, when club flag will be lowered and hoisted again at second gun. The first class will start between the second and third guns; the second class between the third and fourth guns, and the third class at the fourth gun, also being allowed five minutes for starting. A fog horn may be used instead of a gun. Yachts, on their return, will pass either way between the judges' yacht and Tobey Island buoy No. 2. In case of unfavorable weather, the regatta will be sailed on the following Monday.

Measurement and allowance—The racing measurement shall be length upon the water line, plus one-fifth overhang aft. Yachts to be measured with two persons and no more on board. Time shall be allowed for difference of measurement, according to the tables of allowances of the Beverly Y. C. classes. The first class shall include all cat rigs measuring over 24ft. sailing measurement; the second class shall include all cat rigs measuring over 21 and not over 24ft. sailing measurement, and third class all cat rigs 21ft. and under, sailing measurement. All yachts will be required to sail in their respective classes. Sails—Yachts will carry mainsail only; no means except sails shall be used to propel a yacht. Crews—Yachts to be allowed to carry one man for every five feet, and fractional part thereof. Ballast—No trimming by dead weight or throwing ballast overboard allowed during the race. Entries—Entries may be made by letter addressed to George H. Richards, Tobey Club, Monument Beach, or in person at the Tobey Club, so as to be received not later than 8 P. M. July 3, giving name, name and residence of the owner, and measurement of yacht. Each entry must be accompanied by $5 entrance fee. Yachts can be measured by applying to Mr. Richards, at the Tobey Club, at 9 A. M. on the day of the race. Signals—Racing yachts will be furnished with numbers to be shown at the start and finish, and with pennants to be fastened to the leach of the mainsail, and to be carried throughout the race; blue for first class, red for second class and yellow for third class. Protests—All protests must be made to the judges within half an hour after the race, and all questions will be decided by them in accordance with the rules of the Beverly Y. C. Time of race—Race must be made by one boat in first and second classes at rate of two and three quarter miles an hour, in third class at rate of two and a half miles an hour. Courses will be indicated by white numbered flags, shown from judges' boat.

Courses for the first and second classes.—No. 1. From starting point, leaving Bird Island Buoy No. 13 on port hand; to judges' yacht, eleven miles. No. 2. From starting point, leaving Scraggy Neck Buoy No. 10 on port hand, to judges' yacht, eleven miles. No. 3. From starting point, leaving Scraggy Neck Buoy No. 10 on starboard hand; Bird Island Buoy No. 13 on starboard hand, to judges' yacht, eleven miles.

Course for third class.—No. 3. From starting point, leaving Black Buoy No. 3 on starboard hand; Abial's Ledge Buoy No. 1 on starboard hand, Dry Ledge Buoy No. 12 on starboard hand, to judges' yacht, seven miles. No. 4. From starting point, leaving Dry Ledge Buoy No 12 on port hand; Abial's Ledge Buoy No. 1 on port hand; Black Buoy No. 3 on port hand, to judges' yacht.

The first race for the Buzzard's Bay championship will be sailed on July 5, at 1 P. M. at the same place, and will be open to members' sloops under the following conditions: The first class to include all sloops not over thirty feet water line. The second class to include all cats over twenty-four feet sailing length, and not over thirty feet. The third class to include all cats of twenty-four feet and under. Two prizes will be given in each class, provided more than two yachts start. These prizes will be sailed for with the time allowance of the club. A champion pennant will be awarded in each class to the boat making the best actual time, to be held till the next race, and becomes the property of the yacht winning it the greatest number of times during the season. In case of unfavorable weather, the race will be sailed the following Monday. A one-gun flying start will be used. Yachts crossing a line between judges' yacht and a stakeboat moored off the north side of Tobey Island, in Phinney's harbor.

Starting Signals—At 1 P. M. a preparatory gun will be fired and the club flag lowered. At 1:05, club flag hoisted and a second gun fired, when the first class will start, being timed from the gun. At 1:30, third gun will be fired, second class to start. At 1:15, fourth gun will be fired, third class to start. No yacht to cross the line before the gun is fired. Should any gun be accidentally delayed, the succeeding guns will be fired at intervals of five minutes after that gun. Yachts are requested to carry their private signals at the peak. Yachts on their return will pass between the judges' yacht and the stakeboat. A white flag, with number of the course, will be shown on the judges' yacht. Time of Race—Race must be made by one boat in first and second classes at rate of 2¾ miles an hour; in third class at rate of 2½ miles an hour.

Courses—No. 1. From starting point, leaving Bird Island Buoy No. 13 on port hand; Scraggy Neck Buoy No. 10 on port hand to judges' yacht, 11 miles. No. 2. From starting point, leaving Scraggy Neck Buoy No. 10 on starboard; Bird Island Buoy No. 13 on starboard, to judges' yacht, 11 miles.

The first championship matches will be sailed off Marblehead on Wednesday, July 9, at 12 o'clock, M. Handsome prizes will be awarded in each class. A second prize will be given provided more than two boats start. The championship pennant will also be offered in each class, without time allowance, to be held till the second championship match, and to become the property of the yacht winning the majority of races. A special prize, for first class schooners, will be offered, provided two boats start; should only one schooner start, all first class boats will sail together. Classes—Yachts over 23ft. 6in. sailing length, and not over 30ft. waterline, to form first class; over 19ft. 6in. sailing length, and not over 23ft. 6in. the second class; 19ft. 6in., and under, the third class. In case of unfavorable weather, the regatta will be sailed the following day. A one-gun flying start will be used. Yachts will cross the line between the judges' yacht and a stakeboat moored off the Eastern Y. C. house. Four guns will be fired for the start, at intervals of five minutes. The first, a preparatory gun, at 12 o'clock. The first class will start at the second gun; the second class at the third gun, and the third class at the fourth gun. The club flag will be lowered at the first gun, and hoisted agair at the second gun, and yachts must not cross till gun has been fired. Should any gun be accidentally delayed, the succeeding guns will be fired at intervals of five minutes. Yachts on their return will pass between the judges' yacht and the stakeboat. Yachts are requested to carry their private signals at the peak. As soon as the courses are decided on, white flags, bearing their numbers, will be displayed on the judges' yacht. No change of weight of ballast allowed on the day of the race in any class. Time of race—Race must be made by one boat in first and schooner classes, respectively, at rate of 3¾ miles an hour; in second and third classes at rate of 2½ miles an hour.

Courses for First and Schooner Classes.—No. 1. Leaving Red Buoy No. 6 on starboard; Bowditch's Ledge Beacon on starboard; Red Buoy No. 2 on Gale's Ledge on starboard; stakeboat anchored off SE. Breakers on starboard; Half-way Rock on starboard; Black Buoys Nos. 3 and 5 on port, to judges' yacht. 10½ miles. No. 2. Leaving Black Buoys 5 and 3 on starboard; Halfway Rock, stakeboat anchored off SE. breakers; Red Buoy No. 2 on Gale's Ledge; Bowditch's Ledge Beacon and Red Buoy No. 6 on port, to judges' yacht. 10½ miles. Courses for Second and Third Classes.—No. 3. Leaving Red Buoy No. 6 on starboard; Bowditch's Ledge Beacon on port; stakeboat off Curtis's Point on port; Black Buoys 7, 5 and 3 on starboard; Black Buoy on Selman's Berth on starboard to judges' yacht. 7½ miles. No. 4. Leaving Black Buoy on Selman's Berth on port; Black Buoys No. 5, 7 and 7 on port; stakeboat off Curtis's Point on starboard; Bowditch's Ledge Beacon on starboard; Red Buoy No. 6 on port, to judges' yacht. 7½ miles.

The races will be under the management of the Regatta Committee, Messrs. Geo. H. Richards, John Dane, Geo. B. Inches and W. Lloyd Jeffries.

KNICKERBOCKER Y. C.—LADIES' DAY.

MONDAY last was set apart by the Knickerbocker Y. C. as a Ladies Day, with the novel feature of a race in place of the customary sail, one-half the crew of each boat being composed of ladies. The grounds of the club were decorated with flags, and a large tent was erected in which dinner was served after the race.

The yachts were divided into eight classes, the course for the first two being from a stakeboat off the club house to and around the buoy off Fort Schuyler and return, distance ten miles, that for the others being from the stakeboat to and around College Point buoy, thence around a stakeboat off Fish Point, and home to the starting point. The entries were:

FIRST CLASS CABIN SLOOPS.

Name.	Owner.	Mean Length. Ft.	In.
Undine	M. J. Greeley	30	10½
Flash	C. B. Barker	33	00
Demarest	C. Doughty	—	—
Waconda	Mayer & Doscher	—	—

SECOND CLASS CABIN SLOOPS.

Sea Robin	Pearl & Walters	23	09¾
Gil Blas	Smith & Leger	—	—

OPEN SLOOPS OVER 21FT.

Gracie	W. R. Morse	24	05
Mamie H	L. B. Lange	24	08½
Rosetta A	T. R. Smith	24	00
Nellie Thorp	J. W. Thorp	24	10

OPEN SLOOPS UNDER 21FT.

Maggie	A. Wagner	18	01

CAT-RIGGED, 25FT. AND OVER.

Nettie R	A. M. Fowler	28	06
Lizzie R	Vice-Commodore Onderdonk	31	00
Black Hawk	Alexander Christie	27	00

CAT-RIGGED, 21 TO 25FT.

Gilt Edge	Lefferts & Allred	23	05
Mayotta	J. K. Rosenquest	24	01¼
Adele	George Grieve	24	00
Narrioch	C. W. Voltz	21	05½

CAT-RIGGED, 17 TO 21FT.

Willie	R. Schilling	19	04½
Alert	William Quinn	17	04
Odette	W. D. Reed	19	06
Jean	Frank Thorp	—	—
Nimrod	McCormick & Martin	20	06
Susie B	A. A. French	17	07

CAT-RIGGED, UNDER 17FT.

Vaddie	W. A. Brady	16	06½

The race was started at 3:25 P. M., the wind being from southeast and ide nearly full. The times at the start were:

Rosetta A	3 25 41	Willie	3 31 18
Nettie Thorp	3 25 58	Odette	3 31 18
Demarest	3 26 21	Nimrod	3 31 31
Maggie	3 26 33	Lizzie R	3 31 38
Undine	3 26 57	Mayotta	3 31 41
Mamie H	3 26 59	Nellie R	3 31 50
Gracie	3 27 28	Jean	3 32 08
Sea Robin	3 27 44	Black Hawk	3 32 16
Narrioch	3 30 13	Vaddie	3 32 46
Susie B	3 30 29	Flash	3 32 49
Adele	3 30 44	Waconda	3 34 04
Gilt Edge	3 31 14	Gil Blas	3 41 41

All went down the wind for the buoy with booms to port, the leaders well bunched. At College Point buoy the Alert, running free, struck the Jean amidships, disabling her so that she was compelled to withdraw.

On the beat to the next mark, the gentler portion of the crews stood the showers of spray bravely, taking as great an interest in the race as the others, though the boats were tossed about and heeled under the fresh breeze, but the run home was quieter, the winners being Flash, Sea Robin, Nettie Thorp, Maggie, Lizzie R., Mayotta, Nellie and Vaddie. Gil Blas mistook the course, so was out of the race, and Sea Robin, Maggie and Vaddie had no competitors.

The times of the boats were as follows:

FIRST CLASS CABIN SLOOPS.

	Start.	Finish.	Elapsed.
Flash	3 32 40	5 07 59	1 35 19
Undine	3 26 57	5 04 53	1 37 56
Demarest	3 26 21	5 09 20	1 42 59
Waconda	3 34 04	Did not go course.	

SECOND CLASS SLOOPS.

Sea Robin	3 27 44	5 16 11	1 48 27
Gil Blas	3 41 41	Did not go course.	

OPEN SLOOPS, OVER 21 FEET.

Nettie Thorp	3 25 58	4 23 21	0 57 23
Gracie	3 27 28	4 25 39	0 58 11
Rosetta A	3 25 41	4 25 03	0 50 22
Mamie H	3 26 59	4 28 10	1 01 11

OPEN SLOOPS, UNDER 21 FEET.

Maggie	3 26 33	4 36 45	1 10 12

CAT RIGGED, 25 FEET AND OVER.

Nellie R	3 21 50	4 30 05	0 58 15
Lizzie R	3 31 38	4 27 26	0 55 48
Black Hawk	3 32 18	4 35 08	1 02 50

CAT-RIGGED, 21 TO 25 FEET.

Gilt Edge	3 31 14	4 35 37	1 04 23
Mayotta	3 31 41	4 34 29	1 02 48
Adele	3 30 44	4 34 53	1 04 09
Narrioch	3 30 13	4 40 48	1 10 35

CAT-RIGGED, 17 TO 21 FEET.

Willie	3 31 18	4 40 05	1 08 47
Alert	3 33 58	4 46 19	1 12 21
Odette	3 31 18	4 45 48	1 14 30
Nimrod	3 31 31	4 43 59	1 42 28
Jean	3 32 03	Disabled.	
Susie B	3 30 29	Not timed.	

CAT-RIGGED, UNDER 17 FEET.

Vaddie	3 32 46	4 43 59	1 11 13

Each lady of the winning crew received as a prize a silver bangle with the club flag in enamel on one side. After the race, dinner was served and the evening was spent in dancing, finishing with a display of fireworks. The committee in charge, to whose care and labor the success of the races is due, were Messrs. Morse, Varian, Mouton and Lichtenstein.

NEW JERSEY Y. C.

A MEETING of this club was held at the club house, Hoboken, on June 26. Reports of the Regatta Committee on the races of June 19, and of the Trustees on improvements, were read and accepted.

An open regatta will be held on Oct. 2, for the following classes of yachts:

Class A.—For all catamarans, 30ft. and over, entrance, $5; prize, $30 cash. Course from Communipaw—the lower end of Jersey City—thence to and around buoy No. 8½, Southwest Spit, leaving it on the port hand, and back to place of departure, finishing between the first dock at Communipaw and a stakeboat anchored abreast of it. The buoy on Robbin's Reef and the beacon on Romer Shoals will be kept to the eastward going and coming. Jib and mainsail only allowed. Time allowance will be calculated on the basis of one minute to the foot.

Class B.—All yachts of any size, cabin or open, from 26ft. and upward. Sloops under 30ft. will be restricted to jib and mainsail only; over 30ft. will be allowed working gafftopsails, and cutters may carry mainsail, working topsail, foresail and jib; entrance $3; prize, $30 cash. The course for this class will be the same as that of the catamaran class, excepting that buoy No. 13, off the Lower Hospital Island, will be the outer mark instead of buoy No. 8½ on the spit.

Class C.—All yachts, 21ft. and under 26ft.; allowed to carry jib and mainsail only; entrance, $3; prize, $25 cash. Course same as class B.

Class D.—All yachts under 21ft.; entrance, $2; prize $15 cash. Course, the same as noted for the other classes in the matter of start and finish, but rounding Fort Lafayette in the Narrows, as the outer mark, and keeping to the westward, going and coming, of the buoy on Robbin's Reef.

Instead of starting the yachts up the river at Hoboken, they will start from the Communipaw docks below Jersey City, avoiding the North River ferries. No shifting of ballast will be allowed in the races, and crews are limited to one man for every five feet of mean length. Entries may be made to any of the regatta committee, Messrs. E. W. Ketcham, 55 Liberty street; H. C. Dilworth, 563 Greenwich street; A. S. Barkelew, 19 Park Place. Entries may also be made at the club house, Hoboken. A steamer will accompany the race.

EASTERN Y. C. ANNUAL MATCHES.

FRIDAY morning of last week found a fine fleet of yachts, large and small, assembled in the pretty basin among the rocks, known as Marblehead Harbor. Schooners, cutters large and small, and sloops, with yachts' boats and dories afloat on every hand, the occasion being the annual matches of the Eastern Y. C. The oval bay, with quaint old Marblehead on one hand and the hills on the other, covered with pretty cottages, prominent among which is the club house of the Eastern Y. C., made a beautiful picture under the clear June sky.

The queen of all the fleet in size and dignity was Fortuna, just back from the New York races. Of her smaller sisters the most noticeable was the Harbinger, a new schooner lately completed for Mr. J. M. Forbes, by Lawley & Son, from designs by Mr. A. Cary Smith. Her planking is in two thicknesses, the inner skin being 1in. and the outer 2in., with canvas laid in crude turpentine between. New York was well represented by Bedouin, Ileen and Wenonah, none of the sloops, however, being present, while Huron, Hesper, Maggie and Shadow promised to make sport in the races, besides which were a large number of yachts not entered, but on hand to see the race.

The course decided on was No. 6 of the club courses, starting off Marblehead Rock, thence to Pig Rock Stakes, leaving them on starboard, and thence around stakeboat off Egg Rock, leaving it to port; thence to Half-way Rock, leaving it to port, and to the starting boat, leaving it also to port; then out around Half-way Rock again, and finishing between the stakeboat and Marblehead Rock, a distance of twenty and three-quarter miles. The wind throughout the day kept about E.N.E., and was of constant strength, at no time too much for clubtopsails, while the water was perfectly smooth. As the course lay spinnakers were carried from near the start to Egg Rock, six miles, then a beat to Half-way Rock, seven miles, and free again to the stakeboat, with a final beat of two and a quarter miles out to Half-way Rock again, and a run to the finish. The "racing length" on which the time allowance is computed is found by adding one-quarter of the overhang to the water-line length, two-thirds of which sum is then added to the extreme beam. By a resolution passed this year, however, the Regatta Committee may adopt the present rule of the New York Y. C., at its discretion.

The tug Confidence was ready in the morning at Marblehead Rock with the Regatta Committee, Messrs. Appleton, Jackson, Peabody, Haven and Goddard aboard, the members and guests of the club being on the steamer Twilight, in charge of Messrs. Blake and Thayer, which after calling at Salem for some members, arrived at the Rock at 11:45, by which time all were in position.

The entries were as follows:

FIRST CLASS SCHOONERS.

	Racing Length.	W.L.	Allowance, Allows
Fortuna, Com. H. S. Hovey	89.46	95.00	—

SECOND CLASS SCHOONERS.

Adrienne, J. C. Pfaff	61.67	—.—	10 44
Clio, E. C. Chase	65.26	67.95	9 02
Harbinger, J. M. Forbes	63.11	65.80	9 58
Rebecca, Geo. P. Upham, Jr	69.72	73.32	6 40
Sylph, A. C. Wheelright	50.00	47.42	17 47
Tempest, H. F. Whittier	55.18	54.32	— —

FIRST CLASS SLOOPS AND CUTTERS.

Addie, M. K. Abbott	60.47	59.40	11 31
Bedouin, Arch. Rogers	64.43	70.00	9 32
Hesper, W. H. Forbes	47.47	45.89	19 33
Huron, Wm. Gray, Jr	53.24	53.90	15 31
Ileen, Arthur Paddleford	56.89	66.00	13 27
Wenonah, James Stillman	55.88	60.00	14 01

SECOND CLASS SLOOPS AND CUTTERS.

Clytie, F. Cunningham	35.61	33.64	29 34
Hera, C. G. Weld	37.96	34 92	27 32
Lapwing, J. M. Forbes	36.57	35.60	28 32
Maggie, G. H. Warren	39.64	44.26	25 38
Shadow, John Bryant	37.38	33 71	28 02

At 11:55 the signal for the first class was given, Fortuna going over alone, neither Gitana, or Alice, starting at 11:58:23. At 12 M. the signal for the second class sounded, Harbinger getting away first at 12:02:11, Adrienne second. Tempest, Clio, Sylph and Rebecca all within their line, crossing with booms to starboard. The signal for first class sloops followed at 12:05, the limit being 12:15, but all were handicapped, Hesper leading at 12:11:23, Ileen and Wenonah over together at 12:11:39, Bedouin 12:11:54, Huron 12:12 and Addie at 12:12:51. All the cutters carried club topsails and full lower sail, Bedouin at once starting off through the weather of all for leading position. The second class were also handicapped, their signals being given at 12:15 and 12:20, and the boats crossing with Hera first at 12:16:04, Shadow 12:16:07, Lapwing 12:16:21, Maggie 12:17:06 and Clytie 12:17:12.

By this time the leaders were well down the wind with spinnakers set, Tempest being noticeable through hers, which was of a deep blue tint, contrasting strongly with the white sails; Bedouin, Ileen and Wenonah were all doing well, the first, well in advance, setting her spinnaker at 12:25, the other two following at once, while Huron and Hesper were two minutes later. At 12:30 Bedouin was still further ahead, Ileen and Wenonah slightly on her weather, and Huron, Hesper and Addie in a string behind, the latter evidently with no show against her younger competitors.

Even with so light a wind the run to Egg Rock was quickly made. Fortuna turning first, Clio second, then Harbinger, Adrienne and Rebecca, the judges' boat not arriving soon enough to time them. The rest were timed as follows: Bedouin 12:51:52, Wenonah 12:53:39, Ileen 12:55:20, Huron 12:56:06, Addie 12:57:40, Hesper 12:58:00, Maggie 1:05:16, Hera 1:05:25, Shadow 1:06:28, Lapwing 1:06:43, Clytie 1:08:56.

The beat of 7 miles to the next mark was very tedious in the light wind, the yachts being widely scattered, Bedouin having worked ahead of all but Fortuna, while Wenonah was trying for third place. The first to approach Halfway Rock was Fortuna, coming up with both working topsails set, main club topsail, and maintopmast staysail. Near the rock she was obliged to tack, while Bedouin, coming up with spinnaker boom all ready, made the mark without tacking thus lessening still more the distance between them.

The times at Halfway Rock were:

Fortuna	2 31 55	Shadow	3 09 18
Bedouin	2 35 40	Sylph	3 11 40
Clio	2 44 45	Hera	3 12 08
Harbinger	2 45 10	Clytie	3 15 22
Adrienne	2 48 10	Maggie	3 14 05
Wenonah	2 51 20	Addie	3 22 45
Huron	2 58 55	Lapwing	3 24 08
Ileen	3 01 50	Hesper	3 26 00
Rebecca	3 08 20		

Tempest gave up, not rounding the mark.

Sheets were eased off and spinnakers set for the short run in. Before the tail of the fleet was clear of the rock Bedouin was seen coming up gradually for the second turn, to leeward of Fortuna, but so far ahead that near the rock she stood across the latter's bows on

port tack, then tacked around the mark 2m. 30s. ahead of her, increasing it to 3m. 41s. on the short run home. Wenonah and Huron had, in the meantime, started back, working short tacks further up the bay, the former increasing her lead to the finish.

The times of the finish were as follows:

	Finish.	Elapsed.	Corrected.
FIRST CLASS SCHOONERS.			
Fortuna	3 52 48	3 54 25	3 54 25
SECOND CLASS SCHOONERS.			
Clio	4 09 52	4 06 34	3 57 32
Harbinger	4 12 08	4 09 57	3 59 59
Adrienne	4 18 46	4 16 01	4 05 17
Rebecca	4 45 05	4 41 14	4 34 34
Sylph	4 57 58	4 54 31	4 36 44
FIRST CLASS SLOOPS AND CUTTERS.			
Bedouin	4 49 07	3 39 07	3 29 35
Wenonah	4 07 07	3 57 07	3 43 08
Huron	4 18 21	4 08 21	3 52 50
Ilcen	4 20 25	4 10 25	3 56 58
Hesper	5 01 38	4 51 38	4 32 05
SECOND CLASS SLOOPS AND CUTTERS.			
Shadow	4 34 03	4 19 03	3 51 01
Hera	4 37 49	4 22 49	3 55 17
Maggie	4 43 46	4 28 46	4 03 08
Clytie	4 53 50	4 38 50	4 09 16
Lapwing	5 02 05	4 47 05	4 18 33

Fortuna wins first prize in her class, $250; Clio first in her class, $150, and Harbinger $75; Bedouin $150 and Wenonah $75, Shadow $75 and Hera $85.

MINES AND CUTTERS.

Editor Forest and Stream:

Last batch of papers reached our camp through several feet of snow in safety, and depend upon it they were read with avidity around our sheet-iron stove, with bacon and flapjacks pleasantly sizzling after a hard day's work timbering up 30ft. of shaft, which is to take us down to mineral and wealth, and of course finally evolve a full-fledged cutter. I was glad to find the candid admission quoted from the *Herald* in relation to the changes effected during recent years in model and rig, which promise to lead up to a final type of which all good sailors can be proud for other qualities than speed only. The letter or report signed by Com. W. H. Dilworth and Mr. E. A. Stevens, which you appropriately head "Another Blow at the Sandbaggers," is thoroughly on the right tack, and will not fail to influence for good the small classes about New York, in whose welfare I always felt special interest.

The hills and mountains in this neighborhood for miles around have been stripped so bare of timber for mining work that little or no game is to be met, though there is good trout fishing in Twin Lakes, some twelve miles away to the southward. I look forward with great expectation to the June races, and whatever the result may be, feel certain that the cutters will now receive full credit for their good qualities, whether they win or not. Racing has always a large share of luck in it, and this may go against the cutters as long as they are still in the minority. Leadville is pretty dull just now, recuperating slowly from sundry bank failures, but the future promises to see the mining industry put upon a stable and lasting basis. Success to FOREST AND STREAM, the first paper in America to make a specialty of yachting twelve months in the year.

C. P. KUNHARDT.

FLORENCE MINE, Leadville, Col., June 21.

LYNN CITY MATCHES.

A SERIES of open matches will be given by the city of Lynn on July 4, the races being started at 8 A. M. so as to allow the boats to enter the Boston open matches. The races are in charge of a committee from the city and the Lynn and West Lynn Y. C. The classes and prizes are as follows, the measurement being water-line length:

First class, all yachts 20 and not over 27ft. water-line; second class, all centerboard yachts 17 and not over 20ft. water-line; special class, all keel yachts 17 and not over 20ft. water-line; third class, all yachts 12 and not over 17ft. water-line.

The prizes are: First class—First prize, $25; second prize, $15; third prize, $10, and fourth prize, $5. Second class—First prize, $20; second prize, $15; third prize, $10, and fourth prize, $5. Special class—First prize, $20; second prize, $15; third prize, $5; there is no fourth prize for this class. Third class—First prize, $15; second prize, $10; third prize, $7, and fourth prize, $5.

The first course for first, second and special classes is from judges' line off club house to flagboat off Point of Pines, leaving it on port, thence to Western Lobster Rocks Buoy, leaving it on port, thence to judges' boat, passing between it and the flagboat; distance, five miles.

Second course for third class: From judges' line off club house to flagboat off Point of Pines, leaving it on port, thence to Sand Point Buoy, leaving it on port, thence to judges' boat, passing between it and flagboat; distance, three miles.

The following are the rules and regulations: No restrictions in regard to sails. Measurements shall be the length on waterline. In all other respects the rules of the New England Yacht Racing Association shall govern the race. The decision of the judges shall be final. All yachts intending to sail must be in position before 7:45 o'clock A. M. All yachts will come into line without regard to size as follows: First class between two flags bearing the number 1; second and special classes, between two flags bearing the number 2 and the third class between two flags bearing the number 3. A gun will be fired on the judges' boat at 7:45 o'clock A. M., which will be the signal for all classes to form in line. At 8 o'clock it will be fired again, which will be the signal for the starting of the first class. Five minutes later it will be fired again, which will be the signal for starting the second and special classes. Five minutes later it will be fired again, which will be the signal for starting the third class. The committee will consist of Alderman W. B. Moulton, Councilman F. E. Wright and D. H. Taylor for the city; W. B. Newhall, F. S. Newhall, Walter Hawkes and W. M. Rand for the Lynn Y. C., and B. W. Rowell, Lorenzo Poor, Charles S. Goodridge and William F. Walsh for the West Lynn Y. C. The judges are: For the city, Joshua C. Eldred; for Lynn Y. C., William B. Newhall, and Benjamin W. Rowell for the West Lynn Y. C. The judges' boat will be for the exclusive use of the judges, regatta committee, press and members of the city government.

TORONTO Y. C.—The Toronto Y. C. race for five-tonners on Saturday proved quite a success. A finer day could not have been chosen. A light breeze from the east enabled the yachts to cross the line with a free sheet, the course being from an imaginary line off the club house, out through the western channel, thence to a buoy off Gibraltar Point back again to the Queen's wharf, thence to a buoy off Fisherman's Island at the extreme east end of the bay, and back to the club house. There was a great deal of speculation as to the result of the race, owing to two of the boats entered being very closely matched, and both having new canvas just bent. The entries included the sloops Iris and Mischief, the double bugger Midge and the single bugger Mascot. The start was made at 3 P. M., and they all got off well together, with the wind directly aft, which enabled a large spread of canvas. The buoy at the Queen's wharf was rounded in the following order: Iris, Midge, Mischief and Mascot. After hauling their wind, the Iris gradually drew away from the rest of the fleet, and the Mischief took second place, and the buoy at the point was rounded—Iris, Mischief, Midge and Mascot, which positions were kept to the finish, with the exception of the Mascot, which gave up the race, she being too far behind to hope for a place. The Iris crossed the line a winner at 5:13:30, beating the Mischief by nine minutes and a half. The prize was a very handsome telescope, presented by the Vice-Commodore, Mr. John Cosgrave, and to be won three times before being retained, which will keep up the excitement for some time yet. It is proposed to have a race for standing keel yachts belonging to the club of seven tons and under on next Saturday, July 5, the prize a set of flags, presented by a member of the club.—*Toronto Mail, June 30.*

QUINCY Y. C.—The entries in the second match of the Quincy Y. C. on Monday were very few, but nine boats going over the course. The day was clear, with a light wind. The times were as follows:

	Length.	Owner.	Corrected.
FIRST CLASS.			
Queen Mab	22.08	E. L. Burwell	1 14 40
SECOND CLASS.			
Pet	20.01	J. W. McFarland	1 13 27
Spray	19.04	H. M. Faxon	1 16 55
Joker	20.05	George Coffin	1 17 46
Parole	18.10	H. S. Bowers	1 20 50
THIRD CLASS.			
Mirage	17.10	A. J. Clark	0 59 48
Rocket	16.07	A. F. Bass	1 03 18
Elsie	16 09	C. F. Hardwick	1 12 38

BOSTON Y. C. LADIES' DAY.—Saturday, June 28, was the first "ladies' day" of the Boston Y. C., and nearly three hundred ladies turned out to honor the occasion. A number of the club yachts were on hand in the afternoon, among them the schooners Adrienne, Brenda, Tempest, Princess, Lorelei and Alice, cutters Edna, Vayu and Ella May, sloops Echo and Nimbus, and the steamers Galatea, Annie S., Marianna, Gracie, Juella and Nereta. The ladies were taken on board the yachts and the fleet started down the Bay, with a light southwest wind, returning at 6 P. M. to the club house, where supper was laid, after which the evening was spent in dancing.

EASTERN Y. C. BOOK, 1884.—The club list of the Eastern Y. C. for this year shows a fleet of 92 yachts, composed of 13 steamers, 26 schooners, 26 sloops and 17 cutters, of which 37, or nearly 50 per cent. of the sailing craft are keel boats. Of the new vessels added this year, King Phillip, Rondina and Ileen are keel boats, and the Harbinger is a centerboard. The club numbers 456 active members, the officers being Commodore, Henry S. Hovey, schooner Fortuna; Vice-Commodore, J. Malcolm Forbes, schooner Harbinger; Rear Commodore, Wm. F. Weld, schooner Gitana; Fleet Captain, Jas. Parker; Secretary, Edward Burgess; Treasurer, P. T. Jackson; Measurer, Edward Burgess. Regatta Committee, Geo. A. Goddard, Daniel Appleton, E. B. Haven, Henry B. Jackson, Frank E. Peabody. The book contains a full signal code, rules for colors, signals, etc., and the acts of Congress pertaining to yachts, besides the signals of the club, and table of time allowances. We notice on page 92, under the letters M. and P. of the signal code, an expression that has evidently been overlooked by the compilers of the book.

L. Y. C. CLUB BOOK.—We have received from the Secretary of the Larchmont Y. C. the club book for 1884, a handsomely-printed little book, appropriately bound in white canvas. The list of yachts includes 114 boats, there being 10 steam yachts, 16 schooners, 8 cutters, 1 yawl, 32 cabin sloops, 24 open sloops and 23 catboats, the largest yacht, the Atlanta, being 250ft. long, and the smallest, the Mary, 15ft. 7in. The keels number 22 and the centerboards 82; nearly half the fleet being small jib and mainsail and catboats. The club has now 317 members. The clubhouse and anchorage are at Larchmont Manor, on the Sound, about fifteen miles from New York, the club owning a handsome clubhouse, billiard parlors, bathhouse, etc., while the harbor affords a safe anchorage for large vessels. Good courses are laid out on the Sound for the club races, the longest being twenty-eight miles. A neat map of soundings and courses is given in the book, besides tide tables, sailing regulations, instructions as to registry of yachts, United States rules as to lights and signals, and a colored sheet of the club signals.

THE SEA GULL ABANDONED.—The steamer Richmond, Capt. Crossman, which arrived at this port yesterday from West Point, Va., reports that on Friday morning, at 8 o'clock, off Chincoteague, a small sloop yacht in distress was sighted. The steamer ran close to the vessel, and found that her sails had been blown away and her rudder broken. She proved to be the Sea Gull, owned by Dr. Howell, of Philadelphia, and from that city on a pleasure cruise. A son of the owner and Mr. E. L. Street, both of Philadelphia, were on board. As there was a northeast gale blowing and a heavy sea running at the time the yacht could not be taken in tow by the Richmond, so a boat was lowered, the two men taken off and brought to this port. The yacht, it was Capt. Crossman's opinion, would be picked up by some passing vessel when the weather moderated.—*N. Y. Herald, June 29.* Norfolk, Va., July 1, 1884.—The yacht was picked up near Cape Henry by a pilot boat and towed into Hampton Roads.

BOSTON YACHTING.—Rondina has been hauled up and had 1,200 pounds of lead removed from inside and let in to her deadwoods. Messrs. Lawley & Son have nearly finished a little Mersey canoe for Mr. S. W. Burgess, called the Tomboy. She will be decked with waterways, bulkheads fore and aft, full cutter rig, and carries 850 pounds of lead on her keel. The yawl Fad, building for Mr. Geo. A. Goddard, is in frame and partly planked up. The first of the two launches building for Mr. Bennett, from Beavor Webb's designs, is nearly planked up. Her skin is of mahogany, double, the inner plank being laid diagonally, and the outer, fore and aft, with canvas, set in marine glue between them, all being copper rivetted. The boiler is nearly ready, but her engine has not arrived from England.

SAN FRANCISCO.—Several cruises will be made on the 4th, 5th and 6th. The S. F. Y. C. will go to Napa, leaving San Francisco on the 4th, stopping at Vallejo for the races, and on to Napa in the evening. On the next day they will tow to Vallejo, sailing home from there in the evening. The mosquito fleet of canoes and small boats will also cruise to Napa, while the larger yachts will go to Santa Cruz. Several changes in ballast have been made lately, Aggie has taken out another lot, 2½ tons, leaving but 17 tons, Whitewing has taken out 1 ton, and Casco 5, leaving but 25 tons in place of 50 originally.

CITY OF BOSTON OPEN MATCHES.—These races will be held on July 4, off City Point, there being four classes. Class 1.—Sloops and schooners 38ft. and over, prize, $50 for schooners and same for sloops. Course, 20 miles. Class 2.—Sloops and schooners 25 to 35ft. Course, 14 miles. Prizes for keel sloops $40 and $25, centerboard sloops $40 and $25, schooners $35 and $20. Class 3.—Keels and centerboards, 20 to 26ft. Course, 8 miles. Keels $40, $25, $15, $10, and same amounts for centerboards.

HULL Y. C.—The start for the annual cruise will be made at 9 A. M. on July 4, the fleet, starting at a signal from the flagship, will pass in review, leaving the flagship to starboard, and heading southeast, saluting as they pass, a second gun at 9:15 signaling to get under way for the cruise. The first point will be Marblehead Harbor, leaving there next morning.

YACHTING AT GLOUCESTER.—A yacht race will be sailed off Annisquam in Ipswich Bay on July 4, starting at 1 P. M., for two classes of boats, 20 to 26 and 15 to 20ft. There are now near 100 small yachts on the Annisquam River and Gloucester Harbor, mostly sloop or cat rigged.

SALEM BAY Y. C.—The first championship match of this club will be sailed on July 4, the second on July 25, and the third on Sept. 4, the open matches being on Aug. 14.

ORIENTA.—This steam yacht blew out both cylinder heads last week, off Prudence Island in Narragansett Bay, and was towed into Bristol by the tug Narragansett.

PUBLISHER'S DEPARTMENT.

REPRESENTATIVE LONDON JOURNALISTS.—We have received from R. Hoe & Co., through Root & Tinker, the publishers, a copy of this engraving. The journalists whose portraits are given are: John Walter, *Times;* H. Labouchere, *Truth;* Edmund Yates, *World;* W. H. Mudford, *Standard;* J. R. Robinson, *Daily News;* J. L. Latey, *Illustrated News;* F. C. Barnard, *Punch;* Frederick Greenwood, *St. James Gazette;* William L. Thomas, *Graphic;* G. A. Sala, *Daily Telegraph;* Edw. Lloyd, *Daily Chronicle.*

SAFE RETREAT FOR MAD DOGS.—A terrible scare was created by a mad dog on Main street on Wednesday. He disappeared at ten o'clock on Wednesday morning and though thoroughly sought for, was not found till nine this morning. It seems that the brute, with the cunning of a mad dog, had run into a Main street store, the proprietor of which never advertises, and had lain down directly under the cash drawer. This morning a clerk took in a nickle from a stranger, and on going to put it in the drawer the dog was discovered. The strangest thing was that the dog showed no signs of hydrophobia when found. Physicians all agree that the perfect rest and quiet that he found in this store where they didn't advertise, had entirely cured him. He was allowed to go undisturbed, but his grateful owner has presented the keeper of the store wherein his dog's life was saved, with a brand new pair of buckskin pants, which were highly appreciated, as the seat of the ones he was wearing were worn entirely through.—*Evansville (Ind.) Argus.*

The great pine forests of Michigan, Wisconsin, and Minnesota are beginning to show the signs of exhaustion. There is a shortage of production this year in these States footing up about 600,000,000 feet. The average of "first quality" lumber has run down from 12 per cent. ten years ago to 2 per cent. last year, showing the rapid deterioration of stock which is brought to the mills. The quality of the logs is much poorer than ever before, as many have been put in from land once cut over, and new land has been cleared of everything that will make a cull board. The improvident lumberman, who in the past only cut the choice pine and left the remainder to be devastated by fire, now saws down his trees close to the root to save an axe kerf, scrapes the ground with a fine-tooth rake to get every log that will make passable mill culls, and will discharge a foreman that leaves on the ground a log six inches in diameter.—*Northwestern Lumberman.*

"You know that pond near Chester that Charley Potter stocked with carp in 1878?" "Certainly. The scheme failed and—" "So every one thought," interposed Mr. Benton. "Well, last fall, Charley sold the place to a Dutch gardener. In June the Dutchman drained the pond." "Did he find any carp?" Not a scale. It took five weeks for the mud to dry out. Yesterday she was about right and the Dutchman began to plough. Well, sir, the first furrow the Dutchman ran across the bottom of that pond raised his hair, for the plough turned up four of the biggest, fattest carp you ever saw. The gardener he ploughed another round and got two more fish. Then he carried the news over to the railroad depot and a lot of people went back with him, and sure enough there were the fish flopping around on the ground. One of 'em weighed six pounds. He went on ploughing and turned out two and three-pound carp until a couple of dozen neighbors got a mess apiece."—*Pennsylvania Exchange.*

AMERICAN ANIMALS IN ART.

IN the June number of the *Century* magazine Mr. Julian Hawthorn writes of the wild animal sculptures of Edward Kemeys. A number of excellent illustrations accompany the paper and give a very truthful conception of the admirable work of the artist. We extract from the article the following:

"The events of his life, could they be rehearsed here, would form a tale of adventure and vicissitude more varied and stirring than is often found in fiction. He has spent by himself days and weeks in the vast solitudes of our western prairies and southern morasses. He has been the companion of trappers and frontiersmen, the friend and comrade of Indians, sleeping side by side with them in their wigwams, running the rapids in their canoes, and riding with them in the hunt. He has met and overcome the panther and the grizzly single-handed, and has pursued the flying cimarron to the snowy summits of the Rocky Mountains, and brought back its crescent horns as a trophy. He has fought and slain the gray wolf with no other weapons than his hands and teeth; and at night he has lain concealed by lonely tarns, where the wild coyote came to patter and bark and howl at the midnight moon. His name and achievements are familiar to the dwellers in those savage regions, whose estimate of a man is based, not upon his society and financial advantages, but upon what he is and can do. Yet he is not one who wears his merit outwardly. His appearance, indeed, is striking; tall and athletic, broad-shouldered and stout-limbed, with the long elastic step of the moccasined Indian, and something of the Indian's reticence and simplicity. But he can with difficulty be brought to allude to his adventures, and is reserved almost to the point of ingenuity on all that concerns himself or redounds to his credit. It is only in familiar converse with friends that the humor, the cultivation, the knowledge, and the social charm of the man appear, and his marvelous gift of vivid and picturesque narration discloses itself.

"The studio in which Mr. Kemeys works is a spacious apartment between Forty-sixth and Forty-seventh streets, on Broadway. In appearance it is a cross between a barn-loft and a wigwam. Round the walls are suspended the hides, the heads, and the horns of the animals which the hunter has shot; and below are groups, single figures, and busts, modeled by the artist, in plaster, terra-cotta, or clay. The colossal design of the 'Still Hunt'—an American panther crouching before its spring—is not now here; it has been removed to the foundry at East Twenty-eighth street, where it will be cast in bronze, and will then be placed in its appointed site in Central Park. It will be a monument of which New York and America may be proud; for no such powerful and veracious conception of a wild animal has ever before found artistic embodiment. The great cat crouches with head low, extended throat, and ears erect. The shoulders are drawn far back, the fore paws huddled beneath the jaws. The long lithe back rises in an arch in the middle, sinking thence to the haunches, while the angry tail makes a strong curve along the ground to the right. The whole figure is tense and compact with restrained and waiting power; the expression is stealthy, pitiless, and terrible; it at once fascinates and astounds the beholder. While Mr. Kemeys was modeling this animal, an incident occurred which he has told me in something like the following words. The artist does not encourage the intrusion of idle persons while he is at work, though no one welcomes intelligent inspection and criticism more cordially than he. On this occassion he was alone in the studio with his Irish factotum, Tom, and the outer door, owing to the heat of the weather, had been left ajar. All of a sudden the artist was aware of the presence of a stranger in the room. 'He was a tall, hulking fellow, shabbily dressed, like a tramp, and looked as if he might make trouble if he had a mind to. However, he stood quite still in front of the statue, staring at it, and not saying anything. So I let him alone for awhile; I thought it would be time enough to attend to him when he began to beg or make a row. But after some time, as he still hadn't stirred, Tom came to the conclusion that a hint had better be given him to move on; so he took a broom and began sweeping the floor, and the dust went all over the fellow; but he didn't pay the least attention. I began to think there would probably be a fight; but I thought I'd wait a little longer before doing anything. At last I said to him, ' "Will you move aside, please? You're in my way."' He stepped over to the right, but still didn't open his mouth, and kept his eyes fixed on the panther. Presently I said to Tom, ' "Well, Tom, the cheek of some people passes belief!"' Tom replied with more clouds of dust; but the stranger never made a sign. At last I got tired, so I stepped up to the fellow and said to him: ' "Look here, my friend, when I asked you to move aside, I meant you should move the other side of the door."' He roused up then, and gave himself a shake, and took a last look at the panther, and said he, ' "That's all right, boss; I know all about the door; but—what a spring she's going to make!"' Then,' added Kemeys, self-reproachfully, 'I could have wept!'

"But although this superb figure no longer dominates the studio, there is no lack of models as valuable and as interesting, though not of heroic size. Most interesting of all to the general observer are, perhaps, the two figures of the grizzly bear. These were designed from a grizzly which Mr. Kemeys fought and killed in the autumn of 1881 in the Rocky Mountains, and the mounted head of which grins upon the wall overhead, a grisly trophy indeed. The impression of enormous strength, massive yet elastic, ponderous yet alert, impregnable for defense as irresistible in attack; a strength which knows no obstacles, and which never meets its match—this impression is as fully conveyed in these figures which are not over a foot in height, as if vast the animal were before us in its natural size. You see the limbs, crooked with power, bound about with huge ropes and plates of muscle, and clothed in shaggy depths of fur; the vast breadth of his head, with its thick, low ears, dull, small eyes, and long up-curving snout; the roll and lunge of the gait, like the motion of a vessel plunging forward before the wind; the rounded immensity of the trunk, and the huge bluntness of the posteriors; and all these features are combined with such masterly unity of conception and plastic vigor, that the diminutive model insensibly grows mighty beneath your gaze, until you realize the monster as if he stood stupendous and grim before you. In the first of the figures the bear has paused in his great stride to paw over and snuff at the horned head of a mountain sheep, half buried in the soil. The action of the right arm and shoulder, and the burly slouch of the arrested stride, are of themselves worth a gallery of pseudo-classic Venuses and Roman senators. The other bear is lolling back on his haunches, with all four paws in the air, munching some grapes from a vine which

he has torn from its support. The contrast between the savage character of the beast and his absurdly peaceful employment gives a touch of terrific comedy to this design. After studying these figures, one cannot help thinking what a noble embellishment either of them would be, put in bronze, of colossal size, in the public grounds of one of our great Western cities. And inasmuch as the rich citizens of the West not only know what a grizzly bear is, but are more fearless and independent, and therefore often more correct in their artistic opinions, than the somewhat sophisticated critics of the East, there is some cause for hoping that this thing may be brought to pass.

"Beside the grizzly stands the mountain sheep or cimarron the most difficult to capture of all four-footed animals, whose gigantic curved horns are the best trophy of skill and enterprise that a hunter can bring home with him. The sculptor has here caught him in one of his most characteristic attitudes—just alighted from some dizzy leap on the headlong slope of a rocky mountain side. On such a spot nothing but the cimarron could retain its footing; yet there he stands firm and secure as the rock itself, his fore feet planted close together, the fore legs rigid and straight as the shaft of a lance, while the hind legs pose easily in attendance upon them. 'The cimarron always strikes plumb center, and he never makes a mistake,' is Mr. Kemeys's laconic comment; and we can recognize the truth of the observation in this image. Perfectly at home and comfortable on its almost impossible perch, the cimarron curves its great neck and turns its head upward, gazing aloft toward the height whence it has descended. 'It's the golden eagle he hears,' says the sculptor; 'they give him warning of danger.' It is a magnificent animal, a model of tireless vigor in all its parts; a creature made to hurl itself head-foremost down appalling gulfs of space, and poise itself at the bottom as jauntily as if gravitation were but a bugbear of timid imaginations. I find myself unconsciously speaking about these plaster models as if they were the living animals which they represent; but the more one studies Mr. Kemeys's works, the more instinct with redundant and breathing life do they appear.

"It would be impossible even to catalogue the contents of this studio, the greater part of which are as well worth describing as those which have already been touched upon; nor could a more graphic pen than mine convey an adequate impression of their excellence. But there is here a figure of the 'coon, which, as it is the only one ever modeled, ought not to be passed over in silence. In appearance this animal is a curious medley of the fox, the wolf, and the bear, besides I-know-not-what (as the lady in 'Punch' would say) that belongs to none of those beasts. As may be imagined, therefore, its right portrayal involves peculiar difficulties, and Mr. Kemeys's genius is nowhere better shown than in the manner in which these have been surmounted. Compact, plump, and active in figure, quick and subtle in its movements, the 'coon crouches in a flattened position along the limb of a tree, its broad, shallow head and pointed snout a little lifted, as it gazes alertly outward and downward. It sustains itself by the clutch of its slender-clawed toes on the branch, the fore legs being spread apart, while the left hind leg is withdrawn inward and enters smoothly into the contour of the furred side; the bushy, fox-like tail, ringed with dark and light bands, curving to the left. Thus posed and modeled in high relief on a tile-shaped plaque, Mr. Kemeys's 'coon forms a most desirable ornament for some wise man's sideboard or mantel-piece, where it may one day be pointed out as the only surviving representative of its species.

"The two most elaborate groups here have already attained some measure of publicity; the 'Bison and Wolves' having been exhibited in the Paris Salon in 1878, and the 'Deer and Panther' having been purchased in bronze by Mr. Winans during the sculptor's sojourn in England. Each group represents one of those deadly combats between wild beasts which are among the most terrific and at the same time most natural incidents of animal existence; and they are of especial interest as showing the artist's power of concentrated and graphic composition. A complicated story is told in both these instances with a masterly economy of material and balance of proportion; so that the spectator's eye takes in the whole subject at a glance, and yet finds inexhaustible interest in the examination of details, all of which contribute to the central effect without distracting the attention. A companion piece to the 'Deer and Panther' shows the same animals as they have fallen, locked together in death, after the combat is over. In the former group, the panther, in springing upon the deer, had impaled its neck on the deer's right antler, and had then swung round under the latter's body, burying the claws of its right fore foot in the ruminant's throat. In order truthfully to represent the second stage of the encounter, therefore, it was necessary not merely to model a second group, but to retain the elements and construction of the first group under totally changed conditions. This is a feat of such peculiar difficulty that I think few artists in any branch of art would venture to attempt it; nevertheless, Mr. Kemeys has accomplished it; and the more the two groups are studied in connection with each other the more complete will his success be found to have been. The man who can do this may surely be admitted a master, whose works are open only to affirmative criticism. For his works the most trying of all tests is their comparison with one another; and the result of such comparison is not merely to confirm their merit, but to illustrate and enhance it."

FISHING RODS.

Having been the pioneers in the manufacture and introduction of Section Bamboo Rods, we have always taken great pride in securing and perfecting every improvement in order to maintain our position as the makers of the very best rods. Knowing not only theoretically, but also by long experience, that a properly made round rod is the only absolutely perfect rod, we have invariably refused, and still do refuse, to put our name on any but our "Best" round section rods. Our prices for these round rods average only about 40 per cent. more than the prices asked by any other makers, while the rods are widely known to be *incomparably superior* While no hexagonal or any angular) rod can be perfect, we long believed that with proper work manship and material a *really good* angular rod could be made. Being much easier and cheaper to make than round rods, we hoped to be able to offer to those anglers who can not afford to pay the price of our "Best" round rods, a hexagonal rod that would be good and serviceable at a moderate price. We are more than satisfied with the success which has attended our efforts, for we are now able to furnish a hexagonal rod that is really worth having, and at a price which is only a trifle in advance of that asked by other makers.

In addition to the many styles of round and hexagonal Section Bamboo Rods, we wish to call the attention of anglers to our large variety of fine Ash and Lancewood and Greenheart rods. *Every rod guaranteed absolutely hand made.*

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for 120-page illustrated catalogue.

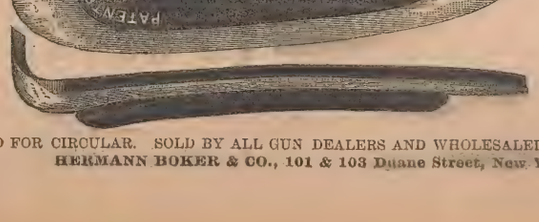
KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY



KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

STORM-DEFYING WINDMILL.

...pumping water for rural residences, ... ains and fish ponds. A. J. CORCORAN, 76 John street, New York City.

EXCELSIOR BAIT PAIL.

(Patented). **The Fisherman's Friend.**

There is an inside pail which can be removed and placed in the water the same as a "fish car," thus keeping the bait alive for an indefinite time. The pan which fits in the inside pail can be raised and lowered, thus affording an easy selection of bait without wetting the hand. The bait is kept alive during transportation (the critical time) by the continuous flowing of the water through the perforations, thus causing a never failing supply of fresh air. For sale by all dealers, or will be sent on receipt of price, 8 Quarts, $2.50 each; 12 Quarts, $3.25 each. Manufactured only by DE LA VERGNE & CO., 176 Chambers street, New York.

Chubb's Game Pieces,

The finest ornament for a Sportsman's Dining Room ever made.

Natural "Dead Game" under glass, and no more bulky than an ordinary picture.

Will send per express C. O. D. subject to approval, on receipt of express charges.

Send for photograph and prices.

ANSWERS TO CORRESPONDENTS.
PUBLISHER'S DEPARTMENT.

DESTRUCTION OF SEAFOWL.

THE northeast coast of North America has from time immemorial been a favorite resort of seafowl. There have been found, from earliest times, myriads of birds of all descriptions, from the unwieldy cormorant down to the tiny sea swallow, which make their nests on the rocky islands and stern cliffs of this threatening coast. Their numbers in bygone years have been such as almost to defy computation. They bred there by millions. The accounts given by Audubon and Coues, Bryant and other ornithologists, who years ago visited this coast, must be consulted to gain any adequate idea of the innumerable multitudes of seafowl which formerly made the region their summer home.

The center of abundance of the feathered hordes was, and still is, about the mouth of the St. Lawrence River. Here the fish food, on which most of them subsist, is most abundant, and all the conditions are such as to be favorable to their well-being. But the increase in the number of the settlers, and the almost entire extermination of the large game on which the Indians once depended for food has wrought a mighty change in the bird fauna of this coast. Nowhere now are there the extensive colonies of seafowl that once filled the minds of the observer with wonder.

The adult birds are slaughtered on their nests for food or for fish bait, and the young or eggs are taken. Colonies once estimated to contain a hundred thousand birds are now without inhabitants.

In an interesting paper on a cruise in the Gulf of St. Lawrence, elsewhere referred to, Mr. William Brewster gives a number of facts on this subject, from which we may make some extracts to show the change that has recently taken place here, and the method by which these birds are being exterminated. Of the eider duck he says, "The eider is still common along the north shore [of the Gulf of St. Lawrence], but its numbers are rapidly diminishing there. This is due largely to the depredations of the Indians of the region who, during the summer, subsist largely on the birds and their eggs. Their manner of taking them is peculiar. They skirt the shore in canoes, keeping as close to land as the depth of water will permit. Meanwhile their dogs range about among the trees, quartering the ground like trained setters, and when a nest is discovered announce the fact by loud barking. The nests are usually within a few rods of the water, and the scent of the dogs is so keen that they rarely pass one. If the sitting bird can be caught or shot the opportunity is seldom neglected, for the half starved Indian neither knows nor respects considerations of mercy—or, perhaps, we should call it policy—which restrain more enlightened sportsmen on such occasions. Proceeding thus, two men in a canoe will frequently ransack twenty miles of coast line in a single day, and find, probably, nearly every eider's nest. The result of this systematic persecution cannot be doubtful or long-delayed."

"Our personal experience with the eider was not extensive. We saw them frequently from Mingan Harbor eastward, but the Indians had been before us everywhere, and we could find neither eggs nor young."

This recital certainly needs no extended comment. Every one can see what the result of such systematic pursuit at this season of the year must inevitably be.

Passing on to the gannets, whose rookeries were once so celebrated, we find the following statements: "Although a few gannets are said to breed on Shag Rock, near Grindstone Island, most of those seen at the Magdalens evidently came from Bird Rocks. This famous rookery was visited by our party on July 4. Its wonders have been so well described already by Dr. Bryant and Mr. Maynard, that I shall confine the present narrative to a brief account of the changes which have taken place since their respective visits. In 1860, the number of gannets breeding on the top of Great Bird (then uninhabited) was estimated by Bryant at about fifty thousand pairs, or one hundred thousand birds. In 1872, Maynard found this portion of the colony reduced to about five thousand birds (a lighthouse had been erected on the summit of the rock and several men were living there). When we landed in 1881 the top of the rock was practically abandoned, although there were some fifty nests at the northern end which had been robbed a few days before, and about which the birds still lingered. The shelving places and ledges around the face of the cliff, however, were still densely populated, and the colony on Little Bird was probably as large as the available nesting places there would allow. But the total number of gannets breeding on both islands did not, as nearly as I could estimate it, exceed fifty thousand. This number, although sufficiently astonishing and impressive when the limited area of the islands is considered, is, of course, insignificant, in comparison with that of the legions which Bryant found twenty-one years before. The decrease is easily explained, for the stringent laws framed for the protection of these and other seabirds breeding on the rocks, are—or were in 1881—but loosely enforced, and a day rarely passed when parties did not land on both islands to collect the eggs and shoot the sitting birds. The eggs are eaten and the flesh of the birds is used, in preference to anything else, as bait in the cod-fishery. The negligence on the part of the Canadian Government, which tolerates such open violation of its statutes, cannot be too strongly condemned."

The author mentions visiting other breeding places of the gannets, one of which, owing to its inaccessibility, is rarely despoiled, but the others had been recently robbed by the Indians.

A similar story is told about the breeding places of the gulls and terns; of the latter Mr. Brewster says: "Poor sea swallows! they have nearly as hard a time among the Magdalens as at breeding stations along our own coast. Not that the birds themselves are as often molested, for the islanders are too chary of powder and shot to waste them at useless marks; but the eggs are duly appreciated, and parties of women and children visit the sandhills daily, taking every one that can be found."

The tale is a pitiful one, but it is the same that is being told everywhere on this continent—the relentless destruction of the wild creatures indigenous to the country. The sea fowl on the northeast coast are protected by law, as are our own birds and beasts, but the laws are not enforced, and remain a mere dead letter on the statute books. Each year fewer of these fowl return to their ancient breeding grounds, and each year those that return are harried on every hand, and at length forced to depart without reproducing their kind. Unless something is done, the end, except in a few isolated localities, cannot be far distant.

Will the Canadian Government take the steps necessary to stop this slaughter?

SALT-WATER FISHING.

THE question has often been asked us why we have paid so little attention to salt-water fishing, and we have invariably answered that there are few of the thousands who indulge in that sport who write about it, and but a few more who care to read of it. If we devote more space to salmon, trout and black bass than to sea fishes it is not because we are indifferent to the charms of bluefishing, weakfishing, etc., but because our readers do not seem to be interested in sea-fishing.

There is a wide difference between the salt-water and the fresh-water angler. The former is content to enjoy himself in his own way, and says no more about it. The trout and black bass angler, on the contrary, considers the fishing as merely part of his pleasure; the trip, the scenery, the grand old woods, all inspire him to fight his battles o'er again. There is nothing of this in the salt-water angler, be he a member of a swell bass club or an humble brother of the hand-line committee who takes the Staten Island ferry-boat in the morning and, with the patience of Job, goes to the rocks and oyster beds for weakfish and with crab bait awaits a "tide runner," as the big weakfish are called in his vocabulary. This sitting on a hard seat all alone waiting for something, which may or may not come, develops a reticence that the fresh-water angler seldom acquires. There is no doubt that the surroundings influence the angler to a greater degree than has been suspected, and the depressing effect of the ocean is noticeable on those who angle in it.

New York city has more good fishing near it than any city that we know of, such as it is. By this we mean waters where a man can go and catch enough fish to constitute what may be summed up in that vulgar term "a mess." If that is the end of angling then surely the salt-water angler should be satisfied, for when the neap tides are on then the "school fish" will repay in numbers what the tide-runners make up in avoirdupois.

We have yet to see the salt-water angler who possessed the fire and enthusiasm of the fresh-water fishers. It is possible that there may be men who love salt water as the trout anglers loves mountain streams. If so we do not know them. We do know, however, that angling for trout among the hills with the ever-changing scenery of a mountain trout brook brings out all the latent poetry in a man, which, if it does not break out in verse, leads him to tell his unknown fellow of the pleasures he has had, and of the means he has used to capture his fish, which he usually regards as a mere incident of the trip.

The salt-water angler is seldom inspired by the beauties of nature because there are no such beauties in the surroundings to be inspired by, and no matter how many poems may have been written on life on the ocean wave, every man who has been out of sight of land knows that they were penned more to create a taste for the monotonous sea than because the writers really liked it. Therefore the salt-water angler is a silent man. He likes to catch his fish, but the bald, flat, unpoetic surroundings have never inspired him to write about them.

Take a list of angling works and see what they treat of. Look over the indices of FOREST AND STREAM and see who writes of his fishing and what his fishing is! Salmon, grayling, trout, black bass; these are the themes of American writers, while our cousins across the water add other fresh-water fishes. Where is the salt-water Walton? Except Young, who wrote "Sea Fishing as a Sport," he has not existed and never will; because, while there are salt-water anglers innumerable, the inspiration is lacking in the element in which they fish. With the salt-water angler the capture of his fish is the only charm; there is no scenery to inspire him, therefore he is not inspired, and while he is often above fishing for the pot or for count, his spirit is depressed by what it works in.

Whether this result is brought about by the monotonous sea, the use of heavy bluefish trolling lines or oily chum, or the companionship of the silent clam, which does alternate duty as bait or lunch, we know not, but the fact remains that of all anglers who not only love their art but seek to improve their tackle and teach others to appreciate it, the fly-fisher for trout and grayling stands at the head. Perhaps there is some other reason which we have not named which will account for the fact that fly-fishers love to write and to read of their sport more than the salt-water angler seems to, for with the latter the angler for maskalonge seems to vie in the matter of reticence. Can it be that it is the catching of heavy fish that thus affects the captors, or is it possible that baits and trolling spoons are the real cause?

WOODCOCK are in season in New Jersey, but the bags have been light. In this State the season will open Aug. 1.

A DEPARTED RACE.

PLENTY of men are yet living who remember when buffaloes in countless herds covered all of the vast plains between the Missouri River and the Rocky Mountains, from the borders of Mexico to the Arctic regions. It is not very long since. Only about fifty years ago their slaughter, to supply the demands of commerce, began, and then it was in a small way. The only article then sought was their skins, for conversion into robes. The trade was at first only with the Indians, and along the Missouri River and its tributaries. The Indian, as a rule, is not wasteful nor improvident in the destruction of game. He realizes that it is the mainstay of his life, and if he wastes this year it may cause him to suffer from hunger next year; hence he kills to provide meat for the present; and preserves for the future. The skins from animals so slain, after sufficing for his own wants, find their way to the trader, and thence into the channels of commerce. Thus began the trade in buffalo skins. As the white man became acquainted with the country he saw profit in it, and about 1830 traders began to reach out into the buffalo country, accompanied by professional white hunters, who made a life business of slaughter. However, they were not very destructive, mainly because of their indolence, and partially, perhaps, for the reason that their arms were very imperfect as compared with those of the present day.

First, trading posts were established along the eastern edge of the buffalo range, upon the Missouri River and its larger tributaries. Then the traders crossed the plains and located a similar chain of posts, or forts, along the western edge of the range. These latter were close up to the foot of the great mountain range and at that time, the old employes tell, the great tide of buffalo migration, north and south, with the changing seasons, surged up against the foothills, and diverging columns turned up the larger streams into the mountains and over the passes above the limit of timber growth into the parks and valleys, and even to the sage plains of our present Utah, Nevada and Idaho. Even then the white man's methods in a few years had a marked effect upon the vast herds. The great column narrowed from the sides. The flanking columns were cut off from the mountain passes. The buffalo became rare west of the mountains. The trading posts moved westward from the Missouri and eastward from the mountains. At first the change was slow, then it increased year by year and the dates of the abandonment of old forts and the occupation of new ones, twenty-five or fifty miles further out upon the plains, would show exactly the ratio of decrease in the millions of wild cattle that formerly roamed there. So the destruction went steadily on, but, as it now appears, slowly, until twenty-five years ago, when civilization leaped in one stride from the Missouri River to the Rocky Mountains. Then the tide of travel across the plains by many routes became great and constant. For hundreds of miles the roads led through pastures yet plentifully stocked with buffalo. The writer has within twenty years traveled for six days in succession upon a stage coach without being at any time in daylight out of sight of herds of buffalo. Of course the slaughter increased with the influx of the white man. They were killed for meat, and when that was not wanted they were killed for sport—mere wanton destructiveness, or to brag about. In this epoch, if such the period may be styled, commerce and the world reaped no benefit from the slaughter, except in the little bit of the meat that was eaten by the butchers and their comrades. The skins were not saved. No meat was sent to market.

Then came the railroads; two lines, the Union Pacific and Kansas Pacific, that penetrated the heart of the buffalo country in 1868 and traversed the entire breadth of it before midsummer of 1870. With them, in the hands of the masses, came also the deadly repeating and breechloading rifles, with which any pot-hunter could "pump" lead into a five hundred acre herd of buffalo with deadly effect, whether he could ever find the carcasses or not. That made no difference. If he wanted one animal he might just as well kill ten, or if he wanted ten it would take but little longer to shoot fifty, and in either case he could then pick out the best—provided the best did not go too far away to die. With the advent of the railways the buffalo killing was for a time all done "for meat." Hundreds and hundreds of men went regularly into the slaughter. The only meat they wanted was hams and tongues. The rest was left to rot. Even the hams were taken only from the best animals, judged by inspection after death, determined by a kind of coronor's inquest. Buffalo hams became one of the largest freight items on the railways. Car loads and train loads went to Eastern markets. Hundreds of tons rotted at the stations for want of shipping facilities, other hundreds or thousands of tons rotted before it could be transported from where killed to the railways.

People got tired of "high" buffalo meat, and the next craze was for the skins. While they were being killed for the meat the skins were not saved. The skin of the hams went with them to market; the balance rotted with the meat. Now the meat hunters all went to killing for skins. A "shooter" would employ five, six or seven "skinners;" establish his camp in the buffalo range and go to work to keep his men busy. Thanks to breechloaders and repeaters he could "down" from seventy-five to one hundred buffalo per day on an average. Nothing was saved but the skin, and this was worth on "the range" seventy-five cents or one dollar. This was the campaign that exterminated the buffalo upon the middle plains.

For two or three years after the opening of the railways named, a train seldom crossed the plains without passing in sight of buffalo, and it was not an uncommon thing for a train to have to wait for a moving herd to cross the track. Now buffalo are never seen from the trains, nor have they been for eight or ten years past. But there remained one more harvest to be gathered from the departed native life and grandeur of the great plains; a poor, pitiful, post-mortem harvest of stinking bones. After they had surfeited the East with odorous hams and glutted the markets of the world with "robes" killed in season and out of season, these gallant hunters turned scavengers and gathered the rotting bones and blistering horns of the countless dead. Railway trains that had in former years groaned under loads of meat and bales of hides were now loaded down with bones destined for Eastern manufactories of various kinds. The whole country was gleaned.

At length the work was done. Destruction was complete. No sign was left to show that a buffalo had ever existed in the country, and the vandals who had hounded them to their death and their bones to the sugar refinery, drifted off northward or southward to follow up the remnants of herds, to gather the bones along other railways, or to repeat the slaughter upon the noble elk that so recently peopled all the valleys and parks of the mountains. Such newspaper paragraphs as the following show their tracks:

"It is said in St. Paul that hundreds of teams are now engaged near Bismarck in gathering buffalo bones, for which the sum of $6 a ton is paid by persons who send them to Philadelphia for grinding into fertilizing powders."

"The buffalo herds of Texas have been reduced to one small herd now feeding on the Pecos River, but this is fast being reduced and its days are numbered. This is a remnant of what was known a few years ago as the "great Southern herd."

And yet the country is full of sportsmen who clamor for more deadly repeating rifles.

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

VI.

A SOFT snow having fallen, not too deep for the comfortable traveling of those so used to such footing as are the hill folks of Northern New England, almost all of Lisha's friends who were wont to gather in his shop had gone fox hunting.

Many times that day Lisha had stood in the doorway to listen to the voices of the hounds, now wafted softer to his ears on the heavy air from the snow-muffled woods than in the brighter days of October, when each hound's note was answered by a dozen echoes, all so sharp and clear that one could hardly tell the real voice from the counterfeit. And once when the music tended toward a runway two furlongs down the road, where the points of two ledges flanked the highway on either side, the old man had taken down his long gun and bare-headed, in his shirt-sleeves, and with his apron flopping about his legs, waddled like a hurried duck half way to the crossing place. But the fox then changed his course and drew the clamor tapering into silence beyond the crest of a great ridge, and Lisha, after some shivering waiting had cooled his ardor, went back to his bench. He was impatient for evening to come that he might hear how it had fared with the hunters, but they were too leg-weary that night to leave their own firesides, even for the pleasure of "swapping lies" and comparing notes concerning the day's events. The next night, however, brought most of them to the accustomed meeting place, ready to talk or listen. Lisha missed the blonde-bearded face and tall gaunt form of Sam Lovel, the mightiest hunter of them all.

"Where's Samwill?" he roared as if he was hailing the mountains. "Them 'ere long laegs o' his'n hain't gin aout, hev they?"

"I sh'd think not," Joe Hill answered, "he went trampoosin' off on't the North Hill airly this mornin' arter a fox. We hearn the ole dawg a tootin' on it to him yit as we come along. 'F Sam c'n git him off he 'll be comin' 'long this way hum to rights."

"What a darned critter!" said Lisha, his tone expressing more approval than his words, "up an' at it, every day an' all day!"

"Samwell," said Solon Brigs, "is a reg'lar Ramrod, so to speak; a mighty hunter afore the Lord. He 'll foller a fox from Daniel to Bashaby afore he 'll delinquish the pursooth, or less the nocturnity of night comes on to him, which that periodical of natur has now arriven an' come, an' therefore he will most proberble do likewise soon."

The sounds of heavy boots being rid of snow by stamping and scraping on the doorstep and the impatient whine of a dog were heard, and the predictions of Joe and the wise Solon were speedily fulfilled by the entrance of Sam and his gaunt sad-faced hound, with a whiff of chill outer air, as if the hunter had brought down a bagful of the North Hill's breezy atmosphere to sweeten the shop with. As Lisha shouted his welcome the eyes of every one sought first the capacious pockets of Sam's frock, and saw hanging out of one the fluffy brush of a fine fox.

"Wal, Sam, ye got him, hey?"

"Got one on 'em," he said, in a tone that implied no great satisfaction with his luck, "Started two more, but one on 'em holed in half an hour, an' t'other one dodged me till it got so dark I couldn't see to shoot, 'n' so I called old Drive off an' come along."

Drive, who had stretched his weary length by the stove, raised his head and cast a sorrowful look on his master.

"Wal, dawg, ye didn't wanter hunt all night for nothin', did ye?" Sam asked, and Drive, sighing, laid his head again on its pillow of leather scraps, and wagged a few feeble taps on the floor, so saying that he did not quite understand it, but concluded it was all right.

"Hain't hed a mou'ful t' cat sen mornin', heve ye Samwill?" Lisha asked, and answered, "Course ye hain't! Mother!" roaring to his wife as if she had been in the next township instead of the next room, and then, as Aunt Jerusha opened the door, "can't ye give Samwill a bite?"

"No, don't gim me a bite, Aunt Jerushy; I'd ruther you'd gim me a kiss!" cried the gallant hunter.

"I shan't dew nary one, Samwill," said Aunt Jerushy, "I sh'd hev Huldy Purin'ton arter me, but I'll give ye some rye 'n' Injin bread an' col' pork 'n' beans."

"An' give Drive that 'ere hasty puddin'," said Lisha, as Sam and the hound followed Aunt Jerusha into the kitchen. Then Lisha asked, "Wal, boys, haow d'd ye make it a huntin' yist'd'y. Any on ye kill anything?"

"Yes," Joe Hill answered, "Sam killed a fox;" ["Of course," said Lisha, in parenthesis,] 'an' the' was one or two on us got shots at a fox."

"Which Jozeff P. Hill was one?" said Solon Briggs, "a firin' of his gun one several time at two identickle foxes twicte, which opponent dew declare the heretobeforesaid Jozeff P. did not to no intense an' puppuses tech ary one on 'em!"

"An' Solon Briggs was another," retorted Joe.

"Nor dew I deny the acquisition intire, though my gun discharged an' went off a pintin' to a opposyte direction to what the fox was at them moments of time a occupyin' of, so it can't be said with strict incoherence to the truth, that I shot at him."

"Haow did that happen?" Lisha asked.

"Wal, the circumstances was these an' happened thus: I was a settin' on a lawg a meditatin' on the mutualability of the human life of mankind, pa'tic'ly in fox huntin', for I hed n't hear'd a haoun' in an hour, when my intention was distracted by a leetle noise behind me, an' turnin' my head, there stood a gre't big fox not more 'n three rod off, jes 's if he was an appargotion that had riz aout of the baowels of the airth, which I was flustrated to the extent of my gun a goin' off an' dischargin' with the butt a pintin' at the anymil fur cluster 'an what the muzzle was. It was one of the accidentalist accidents that ever happened to my exper'ence, for I hed fust rate sight on that fox if my gun had only ben pinted."

"An' what hev yeou got to say fur yerself, Jozeff?"

"O, I d' know nothin' what the matter was ailded things," Joe replied, looking up at the low ceiling as if he expected some solution of the cause of his unaccountable misses to come from above. "I guess the ole gun hain't good for nothin'—or I d' know but the gun 's good 'nough, but the paowder; I dont b'lieve the paowder 's wuth a darn! But mebby 't wa'n't the paowder—guess like 's not the shot wa'n't big 'nough, or I spilt some on 'em a loadin' in a hurry or suthin' or nuther—I d' know."

"You're sartain 't wa'n't no fault o' your shootin', hain't ye, Jozeff? You shot stret 'nough: we allus dew, all on us," said Lisha, his eyes twinkling like the gleam of his awl in the candle light.

"Wal, I never hed no better sight on nothin' in my life 'n I did on both them 'ere foxes—"

"Not on thet aowl?" Lisha interrupted.

"Humph! We hain't talkin' 'baout aowls! Come to think on 't, I guess they was too fur off."

"Guess they be naow," from Lisha.

"Wal, anyhaow, I made the fur fly onct!"

"No daoubt on 't, no daoubt on 't, both times, an' jist as fass as four scairt legs could make it fly! O, good airth an' seas! I wish 't I'd got a shot! I'd ha' showed ye! When my old cannon gits pinted at 'em, it fetches 'em, I tell ye!"

"Haow clus does it fetch 'em naow, Uncle Lisha?" asked he who never spoke but to prepound some great question.

"So clus to," Lisha answered impressively, "that gen'ally I can git their skins off on 'em. Peltier," he continued, turning his glasses on the young fellow, "you hain't ben hear'd from yit."

"O, I didn't cal'late to shoot nothin', only went for the fun on 't. Didn't see nothin' nor git nothin', only a pocket full o' gum. Hassome?" he asked, passing about his big palm full of spruce gum, like a rudely molded tray of clay filled with bits of rough amber. Each one took a piece. The smokers laid aside their pipes, the tobacco chewers resigned their quids, and all went into a committee of the whole to ruminate on the resin of the spruce.

After all the reports were in it was found that none had shot at a fox but Sam, Joe and Solon, and of these with any success only the first-named, who, having now strengthened his interior with a goodly lining of Aunt Jerusha's pork and beans and brown bread, returned to the shop. Declining to exercise his jaw on an offered portion of Peletiah's treat, he filled and lighted his pipe, and got himself into a restful position on a roll of sole-leather. "Wal," he said, after getting his pipe in full blast, "I seen suthin' on the North Hill 'at's an oncommon sight now-er-days."

"What was that?" one asked, and others guessed "a painter," "a wolf," "a woolyneeg," or the tracks of the animals named.

"Was it the footprints of some avarocious annymill, or the annymill hisself?" Solon Briggs inquired.

"Nary one," said Sam, and added after a few deliberate puffs, during which the curiosity of his auditors grew almost insupportable, "a deer track."

"Good airth an' seas! Yeou don't say so, Samwill? I hain't seen nor hearn tell o' one a bein' raound in five, I d' know but ten, year. Did ye foller it, Samwill? It's a tol'able good snow fur still-huntin'."

"Foller it? No!" Sam answered emphatically. "What would I foller it for? I wouldn't shoot a deer on these 'ere hills 'f I had a dozen chances at him!"

"I swan I would," said Pelatiah.

"Yas," said Sam, with contemptuous wrath, "yeou would, I ha' no daoubt on't, an' so would three-quarters on 'em shoot the las' deer 'f he come to their stacks an' eat along with their cattle, jest as Joel Bartlett did, consarn his gizzard! I wish 't was State's prison to kill a deer any time o' year, an' hed ben, twenty year ago. Then we might hev some deer in these 'ere woods, wher the' hain't one naow to ten thousand acres, 'n' where forty year ago the' was hundreds on 'em, 'n' might jes' as well be naow, if 't wan't for the dumbed hogs an' fools. I knowed critters 'at went on tew legs an' called 'emselves men, 'at when I was a boy useter go aout in Febwary an' March an' murder the poor creeters in their yards with clubs, twenty on 'em in a day, when they wa'n't wuth skinnin' fer their skins, say nothin' baout the meat, which tho' wa'n't 'nough on tew carcasses to bait a saple trap. An' some o' them things is a livin' yit, an' would dew the same again if they hed the chance. If they wus gone an' a wolf left in the place of each one on 'em, the airth would be better off, a darned sight. Cuss 'em, they 're wus 'n Injius!"

The stillness that followed this outburst of the hunter's righteous indignation was broken by Solon's rasping preliminary "Ahem! That 'ere last remark o' yourn is an on

dutible fact. The abregoines would not perforate sech an act, because in so a dewin they would ampitate their own noses off, deer a bein' their gret mainstayance, both intarnaliy an' out-tarnally, that is to say, both food an' remnants."

"Wal," said Lisha, as he soused a tap in his tub, "the' can't nobody say 't ever I crusted deer, but tho' was 'nough on 'em 't did, twenty, thirty year ago, an' mis'able murderin' business it was, tew. The' was one man, though," he continued, after some vigorous pounding of the tap on his lapstone, "'at got cured o' crustin' for his life time, which it shortened it, tew."

"It ort t' been shortened afore ever he went a crustin'," said the relentless Sam. "Wal, haow was 't, Uncle Lisha?"

"Wal," said Lisha, taking the last peg from between his lips and driving it home, "I guess it's gittin' ruther late t' begin a story t'night, hain't it? 'Baout what time 's it got to be anyway? Peltier, you jes' go t' the kitchen door 'n' ast Jerusha, won't ye?"

"Hol' on; I've got my crow monitor," said Solon, tugging at a leathern thong that hung from his fob, and presently dragging forth what looked like a goodly sized copper porringer, he consulted it for a minute and proclaimed the hour to be "agoin' on tew 9 o'clock."

"I want er know! Wal, bein' it's so late, 'n' some on ye 's got quite a piece to go, I guess I won't tell 'baout it t'night. Nex' time ye come I will 'f ye 'll put me in mind on 't."

"Prawberbly, in consequent of the demoteness of the inhabitations of some here and present, and the a-proachness of the hour for expirin' to bed, it would be more judiciouser to prefer the narrowation of Uncle Lisha's story until another of aour conjovial gatherin's"—which suggestion of Solon's all fell in with, and Sam Lovel, taking his gun from the corner and whistling up his chase-weary hound, all departed, leaving Lisha to snuff out the shop candle and retire to the kitchen, where, smoking the last pipe of the evening with his stockinged feet toasting on the stove hearth, the purring of the cat, the drowsy song of the teakettle, and Aunt Jerusha's monotonous counting of the stitches as she narrowed the thumb of a striped mitten, "one—tew—three, narrer; one—tew—three, narrer," soon set him to nodding.

"Why, father," said the good dame, casting a side glance at him from her knitting when his pipe dropped from his mouth, "why don't ye go to bed, stiddy settin' there a noddin' like a hard's grass head in a July wind?"

"I wa'n't a noddin' nuther, 'n' haint a bit sleepy," he said, opening his eyes as wide as possible. "I was on'y medytatin'." But he went to bed.

REMINISCENCES OF SHANGHAI.

THIRTY years ago the inhabitants of the foreign settlement of Shanghai, China, awoke to the fact that they as well as their neighbors, the Chinese denizens of the walled city a mile away, had some personal as well as business interest in the great movement which, known as the Tai-ping-wang Rebellion, was stirring slow and sedate old China to its very center.

Tai-ping-wang was one of the names of a prophet who had arisen, and proclaiming himself a true Son of God, and thus younger brother of Jesus Christ, was considered a false or true prophet by about an equal number of his countrymen. All government officials, from the emperor himself down to the humblest mandarin, who for income depended upon the process known as "squeezing," remained unbelievers, for, not content with making war on polygamy, joss worship and opium smoking, three of the most important of Chinese institutions, Tai-ping-wang aimed to become emperor as well as spiritual chief, and his progress was thus that of a rebel; and war encompassed his advance.

The principal scenes of his operations were the northern provinces, which included Pekin and Nankin, and but for the interruption of business by the failures of the tea and cotton growers to produce their usual crops, South China would have shown hardly a trace of the effect of the convulsions going on further north. Like the anvil on the breast of the athlete, the solid, stolid mass of the people of China absorb, with little show of injury, blows which would disrupt another nation. It is the soldier's business to fight, not ours, reasons this mass, and until the blows are delivered closer home they do not seem to feel or take interest in them. But the life of the dynasty was at stake, and the hundreds of thousands who joined the army of the rebel chief were confronted with the greater army of the empire.

We who were then at Shanghai and who had not business interests at stake were, if anything, rather benefitted by the war, for our sole occupation was to enjoy life as much as possible, and the rather limited circle of foreign inhabitants was greatly enlarged by the addition of the officers of American, English, French and German vessels of war and commerce, the former detailed to protect the interests and lives of their countrymen, the latter idle through stagnation of commerce; and the long winter had passed merrily. Dinners, prolonged from 7 P. M. till midnight, private theatricals, occasional spasmodic attempts at balls (for to one lady there were a score of men), and rousing games of tenpins—a dozen burly skippers on a side, with drinks bet on the result of every score—at the one hotel, the Astor House, occupied our nights, and the hours of daylight were too short for our field sports, which, in addition to fine pheasant, partridge, duck, goose and snipe shooting, from either of which one need seldom return with unsatisfactory bag, comprised a sport which most thoroughly dissipated the effects of our nightly dyspepsia accumulation. This was rabbit coursing. Ourselves the hounds, twenty or thirty of us, armed only with short hard-wood clubs, to be used as missiles, and accompanied by a couple of beagles to start the game, would surround a great cotton field and run many miles a day for a few rabbits and exercise.

But the war came to us at last. Aling, a bright and intelligent young Chinaman, who occupied the position of "boy" to a member of one of the English houses, heard daily the views expressed at the various dinners to which, as was the custom in China, he had accompanied his master, to wait upon him; and securing a sufficient number of adherents he had started a local rebellion, having taken good care to put himself and followers in commanding positions within the walled city, proclaimed himself its chief; and after cutting off the heads of quite a number of his countrymen, whose politics differed with his, ornamented with them a couple of hundred spikes, which surmounted the city gates and vicinity, and settled down in the ex-Toutai's palace with his troops stationed along the wall, to hold the place until Tai-ping-wang and his armies arrived.

Aling's example was rather extensively followed. Local rebellions began to break out wherever there was a walled town, within whose walls there was sufficient wealth to encourage the braves; and the cause of religion was advanced by unlimited looting of joss houses, the gods, jewels, money, carvings, paintings, and other "curios" thus obtained, making quite a comfortable little perquisite for Aling and his imitators. At first we outsiders were able to buy from Aling first-class gods, richly decorated, at very moderate prices; but it being discovered one day that built into some of these gods, were secret stow holes, in which jewels had been hidden, the supply ceased, and only quite badly mutilated remains were to be obtained.

After a while trade reopened, and as a great favor several of us were permitted to buy a number of very fine josses, apparently sound as a joss need be. Of course, in consideration of the chance of the possible bonanza which we might be also buying, prices ruled much higher; but we went into the speculation with vigor, and kept it up in spite of drawing blanks, until in sawing up a joss the carpenter discovered that the secret cavity had been already probed, opened and reclosed so skillfully that we could see no external sign. The rascals had first, knowing approximately the location in the back, bored with very fine bits, and the josses in which we found these holes plugged up, had in such as struck cavities, been thoroughly deprived of any valuables they may have contained. The "ways that are dark and tricks not in vain" of those Heathen Chinee were too many for us.

So looting exhaustively and living luxuriantly on the proceeds, Aling and Co. had gay times, and were in no hurry for the arrival of Tai-ping-wang with his cohorts, to whom they claimed that they intended to turn over the captured city, and thus secure recognition as legitimate rebels. In anticipation of this event, a few of the more sanguine had adopted the distinguishing badge of the Christians by having their queues cut off, and ceasing to shave the head, but the more astute had modified this policy and contented themselves by coiling the tail neatly, and covering it with a cap and such hair as might grow, prepared thus to resume, with slight difficulty, their allegiance.

They waited in vain though, for in due time, instead of the expected rebel leader, there appeared on the scene an imperial army, some ten or fifteen thousand strong which, having selected an eligible, comfortable and safe location, settled down to besiege the city. I advisedly say safe and settled, for the distance of the spot selected was several gun shots from the walls; and then and thus they too enjoyed life, planting vegetable gardens, setting up shops of all descriptions necessary for repairs of shoes, clothing, etc., and following the example of the ancient Romans in dealing with the Sabines, provided themselves with wives *ad libitum*. Extensive earth works were erected, which inclosed quite a number of the haycock-like mounds which served as lookout stations. These mounds had been erected by an ancient dynasty as burial places, and were the only elevations visible above the flat plains for many miles.

And thus the besieged and besiegers might all have remained until now, left to the full enjoyment of each other's society, for all the interest the foreigners might take in their doings; for trade went on as usual and the surrounding country remained peaceful. It was the soldiers' business to fight, not theirs, argued the peasantry; and Chinamen grow rich by minding their own business. "No belongy my pidgin" in their motto. But the soldiers on both sides became addicted to a bad habit; and started a game in which we found it necessary to take a hand. Pretending a fight, a body of men from one side or the other would retreat into the suburbs of the foreign settlement; and this produced considerable hard feeling, for the fire of the pursuers would be in our direction, and sheltered by our houses, the retreating band would break up into skirmishers, each individual devoting himself to looting and escaping with his booty.

The foreign settlement of Shanghai consisted of a large number of stone houses, the business houses and residences of representatives of American, French, German and English merchants, and were built along the banks of the narrow river, extending perhaps a mile inland. The river front was skirted by a broad, smooth road, with a sea wall, called the Bund, and in the rear of the town there was a large and well-appointed race course. The Bund and the race course were the fashionable resorts for driving, riding and promenades. The walled city, occupied exclusively by natives, was about a mile higher up the river, which it also fronted, and the space between was covered with squalid Chinese suburbs up to the edge of the Yan-kin-pang creek, which was the southern boundary line of the foreign settlement. In the rear of the city and about on line with the race course was the Imperialist camp. The four places, viz., the foreign and Chinese cities, the race course and camp, thus occupied the four corners of a somewhat irregular quadrangle.

About midway between the two cities the rebels had erected an earthwork on the water front, from which there was a very frequent exchange of harmless cannonading with an Imperialist battery across the river; and occasionally a couple of Imperialist war vessels, one a refitted bark named the Sir Herbert Compton, would take position amidstream, and give the rebs a very lively time, most of which was, however, generally spent in getting out of reach of the shots. The Sir Herbert was commanded and partially manned by beach-comber white men and Portuguese. These little combats were plainly visible from our quarterdeck, and served to while away our otherwise dull watches, during which there was otherwise little variation; for even the floating by of dead bodies, at first rather interesting, became so common a sight as to attract but little attention, except when the tide swept them across our hawser and we had to bear them clear. We noticed, by the way, a peculiar thing in regard to these bodies. All those of the men floated face down, of the women face up. This probably was due to the buoying effect of the breasts of the latter. One day the exhibition was quite a good one. Through some unknown cause fire entered the magazine of one of the attacking vessels, the Antelope, I believe, and in an instant she was flying into the air in fragments, some of which descended uncomfortably close to ourselves.

Several events had taken place which led to an affiliation, to a certain extent, between the rebels and ourselves. Among them was first an affair with the Sir Herbert, which one day saw fit to bring to and seize a pilot boat, owned by two American pilots named Ayres and Linklater, haul down the American flag, and make prisoners of some of her crew. An hour after this event the Plymouth had slipped her moorings, dropped down the river, re-anchored between, and with her broadsides bearing on the two Chinese vessels, and the Compton's captain, also the Toutai or imperial governor notified that if in one hour—noon—a salute of twenty-one guns to the American flag was not fired we would sink them both at their anchors; and while this was pending a boarding party under Lieut. Guest had released the prisoners and made others in their place. At noon the salute was fired, and we returned to our moorings. The rebels were, not unnaturally, well pleased with this act.

It so happened one day that a little combat between the two forts resulted in quite a success for the rebels, for some shot was actually landed in the fort across the river, an almost unprecedented event, and as these shots paved the way to a warm friendship between myself and Aling, the rebel chief, which produced among other results this yarn, I refer to them.

Two or three of us on liberty strolled into this fort, and there having been no firing that day owing to its being a holiday of some sort, we were a little careless and mounted the parapets. While looking at the enemies' quarters we were saluted with half a dozen shots in quick succession—all landing in the river considerably short. We were young then and the challenge was not to be treated lightly. We manned the biggest of the rebel guns, and knocking out the quoin, which with Chinese guns takes the place of an elevating screw, but which, being immovable, prevents any change in the elevation, pointed and fired, and after a couple of shots, getting the range, we succeeded in landing some shot in the fort, whose defenders fled, and the thoroughly silenced battery was abandoned. I shall never forget the absurd mixture of pluck and cowardice we displayed at first, for not one of us dared touch the gun off. From our point of view so dilapidated and rusty an old machine was it, with vent like a teacup, the chances were ten to one that we at the breech end would get the worst of the explosion, and it was not till two or three exchanges had warmed us up that we failed, after fitting a long enough piece of slow match, to rush behind a bomb-proof buttress for shelter until the explosion. Although the United States Consul and our Captain endeavored in vain to ascertain who were the officers who thus "gave aid and comfort," etc., Aling knew very well, as did all of his following, and was very grateful and hospitable whenever, as we often did, we paid him a visit.

We were supposed to remain neutral, but were almost forced to take serious steps. To the race course all Shanghai foreigners resorted every afternoon, and during these hours there was safety in numbers; but very few dared visit it at other hours when every one was at business. One forenoon, though, it happened that an invalid English lady, accompanied by an English gentleman named Caldecott Smith, were riding in a palanquin. They were attacked, maltreated and robbed by some bushwhackers from the Imperialist camp, and probably would have fared even worse but for the opportune arrival of a squad of English sailors on liberty and donkeys, who had come out for a scrub race. They soon cleared out the Chinamen and escorted the party home.

Then the music began. As had been arranged, a signal of "assistance wanted" went up to the English Consul's flagstaff, and in less than half an hour, a body of perhaps a hundred men were marching double quick toward the Imperialist camp. Of this body, the Plymouth, United States sloop of war, and the Encounter and Grecian, English war vessels, with some merchant ships in harbor, furnished four-fifths; the remainder were young men, clerks, partners and others, in the various houses. Without much time wasted in parley, the first of the earthworks reached was attacked and carried, nearly all of its garrison having fled incontinently. About twenty got left, and their detention became a permanent one, for the sailors were ugly; they had been spoiling for a fight.

One little incident I remember combined to the most extreme degree the horrible and ludicrous. The captain of our after guard, Berry by name, chased a Chinaman, gained on him, until just able to reach him with his bayonet point, the bayonet being fixed. This he thrust into the poor devil's stern about half an inch. The prick quickened the fellow's speed, and with unearthly yells and contortions of face through fright and pain he did his best. Berry, with his arms and gun stretched out as far as possible, could do no more than just keep up; until at last the fugitive stumbled and in a moment it was all over. It seems heartless to say the sight had in it aught of ludicrousness, but barring that the contortions and grimaces were due to pain, and that it was a struggle for life, the attitudes, gestures and efforts of both men were exceedingly funny.

After demolishing the fort the party returned, word having been sent by Captain Kelley, of our ship, and O'Callahan of the Encounter, to the Imperialist leader that the encampment must be at once broken up, and the army removed to the other side of the walled city. Twenty-four hours were given in which to begin this evacuation.

The next day, April 4, 1854, there occurred the combat known throughout China as "The Great Battle of Muddy Flats." The twenty-four hours grace would be up at 3 P.M.; and at that hour about three hundred Americans and Englishmen, commanded by Captain Kelley, he being the senior officer present, were posted at various commanding points; and we were awaiting the signal, which should start us on the Herculean task of combatting three times as many thousands as there were hundreds of our own men entrenched behind strong earthworks. We were watching anxiously for signs of a movement of evacuation, but none appeared; and at the appointed hour Captain Kelley opened fire. The effect of that first shot was simply wonderful. It was a 12-pounder shell, from a howitzer; and fell a trifle short. In an instant a score of Chinamen sprung over the wall, and rushed toward the spot where it had struck; in another moment there was an explosion, and the crowd was torn to fragments, some escaping with life, seeking shelter again, many without it were lying torn and maugled. They had never seen a shell before, and in attempting to carry out a superstitious belief, that to return the first shot of an enemy insures victory, they had scrambled for its possession. The fuse of the shell had been cut too long, and the delayed explosion cost them dear.

A series of deafening yells was heard, and quickly the rear portions of the wall and soon after the country beyond was yellow with a terror-stricken, stampeding swarm, and as we afterward found, by counting the dead, not more than three hundred ("just one apiece for us," as I heard a sailor remark) remained to fight us. For half an hour we continued firing, then ceased and charged.

During the firing an amusing episode occurred. The loader of a howitzer, which was worked by volunteers from various English and American houses, disappeared after the first fire. He was a popular man and a noted wag, whose grim humor at times was very eccentric. Hearing that he was hit, for some one had seen him running toward a ditch, several there sought him, and found him, not wounded, but sitting up to his waist in the water lighting a cheroot. "My God, Charley, what's the matter?" sung out the first who saw him. "Matter! Why, I found I've made a great mis-

take. It's the business of those navy men to fight; my business is to keep books for Hiram Hogg & Company, and I'm going to stick to it. Here's your rammer."

Our charge was a brilliant success up to a certain point, and that was the edge of a wide and deep ditch, which, surrounding the forts, stopped us when within fifty yards evidently. However good sailors, we were poor engineers. As we stood puzzling, there was a sudden discharge of six or eight guns right in front, and although the greater portion of the missiles went whistling over our heads, yet enough dropped to kill three men and seriously wound several others. No attempt was made to reload the guns, for the fate of three men in succession, who, while vainly endeavoring to fire a large gun, were picked off with rifles through the embrasure, deterred them. When we afterward drew the charge from this gun we found over a peck of gingal balls of iron, an inch in diameter, in a canvas bag, in addition to a round shot.

While thus detained the Englishmen had made a flank movement, torn down a house, and with its timbers bridged or platooned the ditch, and soon their vigorous hurrahs mingled with the Chinese yells. The latter soon ceased, and ascending smoke and flames showed that the battle was over, the forts ours, and fired. Not a living Chinaman remained, and scattered throughout the inclosure were many roasted to a crisp. That night we bivouacked near the field and in the adjacent house of a missionary.

At midnight I was roused up to take charge of a reconnoitering party, and in so doing I got, I think, the worst scare of my life. It was intensely dark, raining heavily and cold. We were plodding along in perfect silence. The path through the clay field was excessively slippery. My foot came in contact with something, and I fell; stretching out my arms to save my face, one of my hands landed on something cold and clammy, and into a cavity of this something two of my fingers entered, scraping on something as they did so. I shall never forget the horrible sensation which thrilled through me as it dawned upon me that my hand was upon the face and my fingers in the mouth of a corpse. Since then, when I have heard the expression "my blood run cold," I have understood the meaning.

The next day a permanent post was established on the Yang-kin-pang Creek, about midway between the contending parties, for the Imperialists accepted the situation and began erecting new works on the location assigned. We took possession of a very large temple or joss house, and here in the midst of barbaric gorgeousness we remained some months, administering occasional thrashings to both parties as they deserved it, and establishing a code known throughout China as "Shanghai neutrality—whip both parties."

About once a week, on a fair day, we would be entertained with a grand battle. Not only ourselves, but the Chinese would gather in tremendous crowds to see the soldiers fight, never a man of them thinking himself called on to lend a hand. From one side or the other would issue first a tremendous din and clatter, gong beating, cracker and gun firing, rockets and yells. This continued long enough to put the enemy on guard. A body of men, perhaps a thousand, would follow, and first rushing, then walking slower and slower, would halt at three or four gunshots distance and begin a series of ridiculous maneuvers undoubtedly intended as challenges. Then agile men, most grotesquely attired, marked with heads of dragons, tigers or devils, would rush almost into danger, shouting and prancing like clowns. One chap, I remember, wore on each arm a large circular shield, placing which close to his side, the edges on the ground, he doubled up, and with one heel for a motive power, resolved himself into an animated vehicle.

The challenge was always accepted and, the opposing force having reached the other side of the danger belt, the firing became furious and dangerous, too, to those of us to the right or left and within distance, and from our position we could see the fall of many men on both sides. At once a lot of others would pick up the corpse and quickly transport it to the rear, drop it, and flee, the corpse at as lively a gait as his bearers. It was against such flights that we had to guard, for before our fight they were frequently into the foreign settlement, where there was both shelter and booty.

Being on rather good terms with the rebs, we would now and then during these fights stroll over into their ranks—quite as safe a place as one could find within hearing distance—and standing there one day I saw for the first time the power of a Minie rifle. An Englishman named Reynolds, commonly known as Pirate Reynolds, had espoused for a consideration the rebel cause. He was out this day and I was talking with him about his rifle, which he showed to me and explained, finishing the exhibition with, "D'ye see that chap with a red shirt, jumping?" he pointed as he spoke. "Yes." "Well, watch him," and in an instant I saw the Chinaman leap into the air higher than usual, fall and lie quiet, and at the same moment heard Reynolds's gun. It was a long shot but a good one, and settled the fight, and almost every battle had been settled in the same way—the Imperialists fled. It was the practice of Reynolds to let the fight go on as long as he felt in the humor, then he would stop it—thus he held the balance of power.

A personal resource was the society and interchange of visits with Aling, the rebel chief, who, since the little battery affair described, had become very friendly. One day, entering the gate of the city, I was struck with the unusual number of freshly-severed heads which ornamented the spikes. Nearly every spike for a hundred yards in both directions bore its ghastly trophy, and they were not more than a yard apart. Evidently there had been a row, and I hurried to Aling's quarters, formerly the palace of Toutai (Chinese Governor). Several days had elapsed since my last visit, and a strange guard at the inner doorway detained me until Aling was communicated with. While thus waiting my attention was drawn to a bamboo cage in the darker part of the court, in which was a prisoner. I strolled toward it, and the crouching figure sprang into life—a woman who, thrusting her arms through the interstices, grasped at my legs and poured forth a torrent of tears and (evidently) prayers. Aling, when I questioned him, gave me explanation both as to the heads and the prisoner. There had been a local insurrection and attempt by certain Toutai men (loyalists) to recapture the city, and a sharp fight had ensued.

"But, Aling," said I, "what fashion that piecy woman down side?"

"He belongy Toutai woman, he makee spy pidgin."

"What thing you makee he; you makee killum?"

"Killum he, no can; sposey he man, my makee killum; sposey he woman, my puttee stone he neck; puttee down side water; bymby he dlown."

I resolved that if it were possible I would save that woman's life, though not for any very romantic notions, for she was neither young nor pretty. Persuasions were, however, in vain, although I did at one time get Aling's acceptance of an offer I made for her life, he offering compromise on "my punish he litty," but this from a Chinese point of view might mean most terrible tortures, to which death were preferable. I had seen one poor devil punished, and I wanted no more of it. At last a happy thought struck me. Not long after our battle with the forts, Aling, impressed with the efficacy of shells, had begged me to teach him how to make them; this I had peremptorily refused to do, for as I told him it would be very wrong in me to give such information, and which (I did not mention) I really didn't know myself; for thirty years ago midshipmen learned how to use guns and shells before learning how they were made. Taking, however, the chances that I could learn from one of the lieutenants, I reopened the negotiations with an offer to teach him the secret; and the price was to be the woman. Eventually he stipulated that I should also furnish a fuse for a model, and permit him to retain the woman as a prisoner, to be comfortably lodged and fed, and I to have right to visit her. She became mine, my property, subject to the conditions, as much as my dog is now. With looted champagne, cheroots and pale ale the bargain was sealed, and Aling said and I said "my can secure."

I repaired on board ship, called the gunner and another midshipman (since become a lunatic) into my counsel, and we devised a plan and made drawings of two hemispheres, on the peripheries of which were to be cut, on one a male, on the other a female screw, provided with which and a fuse, I again visited Aling and my property. Both were delighted to see me.

Ten days after I called again. Aling sat, as usual, at his table where writing materials had always given place to refreshments on my visits. This time there was no move in that direction and Aling's greeting did not seem as cordial as usual. He left the conversation to me, answering in monosyllables. There was a chilly, depressed air about him. I endeavored to cheer him up and this conversation ensued:

SELF (*cheerfully*)—"You have makee that shell, Aling?"

ALING (*curtly*)—"Hab makee."

SELF—"How many piecy hab makee?"

ALING—"Plenty piecy."

SELF—"You hab make fire them?"

ALING—"Hab makee flire one piecy."

SELF—"How you likee he?"

ALING (*excitedly*)—"My hab make flire one piecy; hab killum lum (eleven) man."

SELF (*reassuringly*)—"That very good, Aling, one piecy shell killum eleven men."

ALING (*bursting out*)—"Hab killum lum man, he no belongy Toutai man, hab killum my man."

Whether the gun burst, or the shell prematurely exploded, I never have found out. I called to see my protégé, but she was gone.

PISECO.

ON THE GUAGUS.

I HAD often heard glowing accounts of the trout fishing to be had at "Guagus Cold Springs," on the head-waters of Union River, three miles above Brandy Pond, Me I had visited the place often enough deer hunting in winter, but had never seen it during the trouting season. So early last September a jovial party, consisting of Josi, Jim, Walt, Lou and the writer, well fortified with courage, hardtack and pork, started for that locality, which is by no means easy of access, except in winter. Josi and Jim, like myself, were old hunters and fishermen; Walt and Lou were brothers, sons of the aforesaid Jim. Walt was a good fisherman, but on this occasion his whole soul was wrapped up in a brand new 10-gauge, 10-pound gun, with which he prepared to slaughter partridges innumerable, and he even darkly hinted of bears, which abound throughout that entire region. Lou was not a fisherman, neither was he a hunter; still he was considered the most indispensable man in the party, simply because he would eat anything and everything that could be caught or killed, and all that was cooked that the rest of us could not dispose of; so that with him in a party, culinary matters were brought down to the simplest basis—merely to find something and cook it. At this present writing, he is about receiving his diploma at the medical department of the Vermont University.

An atrocious road, six miles in length, from Greenfield, brought us to the "Extract," said Extract being a huge mill, furnished with an engine and scores of cauldrons and vats, where tens of thousands of cords of hemlock bark were ground and steeped, the liquor poured into barrels, each weighing when full 400 pounds, and representing one cord of bark with only one-seventh of its weight, making a vast saving in hauling and freight; it was then hauled by heavy teams to the station, eighteen miles away, and sent to tanneries all over the country. Two miles of impassable road brought us to the shore of Brandy Pond. A beautiful white sand beach almost surrounds this lovely sheet of water, which is almost perfectly round, with an island gem set in its center. The lake is about two miles in diameter. It is two miles from where the road strikes the pond to the inlet on which are situated the Cold Springs.

While tramping up the beach a shy and solitary lesser yellowlegs—a rare bird in that vicinity—arose from some rushes which grew around the mouth of a little brook, and alighted out of sight around a point a short distance in advance. "Now, Walt, have your gun ready, and when you round the point you will probably get a shot," said Josi, and when Walt, obedient to this advice, walked cautiously around the point, with his much-loved Parker all ready to lift to his face, there stood the yellowlegs, stretched up and motionless, a very long shot off indeed. "Try your new gun," said I. Bang went the beauty, and the yellowlegs bounded two feet into the air and came down on his back, stone dead. Sixty-eight paces, with No. 8 shot; good for the gun. Lou viewed the bird with delight. "We will fry him for dinner," he said, as he quietly poked him into his coat pocket.

On reaching the mouth of the inlet we succeeded in finding a canoe, concealed in a swamp by a hunter, who had kindly given us directions where to look for it; but as the water was too low to float a canoe below the Palmer Dam, which is nearly a mile above the lake, we were obliged to carry it that distance, and then when we launched it on the dead water above the dam we found that the fervent summer sun had melted the pitch off its sides, so that when heavily loaded the water poured in at such a rate that Josi and Lou volunteered to walk. This was no light task, as the entire distance to the Springs was a soft bog, covered with hardhack and labrador three feet high, making the walking horrible. Half way to the Springs we met a young fellow, who had been up the stream after cranberries, who informed us that a crew of cranberry pickers half a dozen strong had camped at the Springs for nearly a week, and had been gone only twenty-four hours. All our visions of silence, solitude and trout vanished instanta; sadness was depicted on all our faces, and even the dip of our paddles took on a subdued and quiet tone. Arriving at the Springs, we found abundant evidence of the truth of our informant's statement. There was a solid beaten path the entire length of the reach of water where the trout were wont to congregate. Tent poles and half consumed sticks of firewood could be seen on the knoll above, and to complete the desecration the ubiquitous, the irrepressible, the soul-harrowing tin can leered maliciously at us from various little hollows, which ought to have been sacred to mosses and ferns. This infernal adjunct of a vicious and effeminate civilization has about the same effect on me when seen in the wilderness that a red rag has on an irritated bull. What lover of nature who, toiling with infinite labor to the top of some rocky chasm, has not been filled with rage and disgust to see painted in enormous letters on the opposite cliffs, "Children cry for Mrs. Soothlow's swindling syrup?" Thus doth the tin can affect me.

The alder and choke cherry poles which lay on the bank were proof that the finer arts of angling had not been brought to bear on the pool, and we still hoped that some of the more aristocratic beauties had scorned such rude wooing, although there's no denying that an alder pole will sometimes do frightful execution in the hands of a rural expert. On jointing up my rod I made the pleasing discovery that in changing my clothes at Greenfield I had left my entire outfit of flies and leaders in my inside vest pocket. This was the last straw! In sheer desperation I quitted the pool altogether and wandered off up the stream, first strapping on a box of worms, with which we were well provided. A short quarter of a mile above the pool I found a rude bridge, which had been thrown over the stream the preceding winter by lumbermen; the two huge pines across which the poles were laid had been swung partially around by the spring freshet, and reached about half way across, with their outer ends under water, their inner ends high and dry, and part of the flooring still remaining. On the opposite shore the bank was steep and shelved over, and altogether the place looked inviting. Carefully baiting with a lively worm, and creeping up behind the flooring, I made a cast just above the end of the lower stringer. An instantaneous tug followed the light plash of the hook. My reel gave out merry music, and I barely succeeded in clearing the end of the upper stringer as the line spun through the water; then a few exciting moments of vigorous fighting and careful playing, and I dropped the luscious beauty into my basket with a sigh of content. Just as I made the cast I caught sight of Walt strolling listlessly up the opposite bank, as if his courage had all evaporated. All his languor disappeared when he saw the bent rod, and before I made a second cast he had spied the overhanging bank with the unerring eye of a true fisherman, and for half an hour our reels alone broke the stillness of the lovely September evening. Twenty trout rewarded our joint efforts at that old bridge, for which I shall always hold it in grateful remembrance. Then we lightly retraced our steps to rejoin our comrades, who had succeeded in coaxing half a dozen fine trout out of the pool.

Preparations were at once made for supper. Our cooking outfit was not extensive, consisting of a frying-pan and coffee pot only, but great possibilities lie dormant in these two simple utensils, and we proposed to tax their capabilities to the utmost. Soon there arose the fragrance of what Theodore Winthrop called "the saline juice of fire-ripened pork." The freshly caught trout, cleansed in the icy waters of the Springs, were dropped into the hissing fat, the fragrant coffee bubbled and sang, and as the soft September twilight deepened into darkness, the plaintive notes of the whippoo-will floated out clear and distinct on the evening air. What language can describe the enjoyment of such a meal, and amid such surroundings? I pause as I write and try to imagine how many brother sportsmen, at home and abroad, as they read this weak and inadequate description, will recall just such scenes in their own experience, and fill in all the details from a loving memory; to all such, "Penobscot" extends his right hand of fellowship.

While sitting around the camp-fire quietly enjoying our evening smoke, a sibilant sound cut sharply through the night air. "What's that!" said Walt, bounding to his feet and feeling around for his gun. "That," said Josi, slowly removing his brier-wood pipe from his mouth and speaking with a deliberation strangely in contrast with Walt's excited exclamation, "is an old buck which smells the smoke from our fire." That's the first one I ever heard," Walt replied. "It sounds something like a fox," for while they were speaking the buck was keeping up a perfect fusilade of snorts, and he continued at intervals for a quarter of an hour. We had brought a camp spread with us, but not a tent, and a heavy shower coming up just before midnight, threatened to drench us; however, we protected our heads by turning the canoe over us, and just as it began to run through the spread in a way reverse of agreeable, it passed over and we slept the sleep of the just.

The next morning we were astir at dawn; the sky showed every indication of rain, but we nevertheless decided to go to Micketowas Lake, four miles distant, at the head of which is Coomb's Brook, one of the best trout streams in the county. A lumbering road, which we knew led to the lake, passed within sight of our camp grounds; but it was a new one, and none of us had ever traveled it, or knew where it struck the lake, and as the latter is nine miles long, it will be seen that this was an important point. But being determined to go, we just hoped that it came out at the head and started off. The road lead away from the stream on which we were encamped for nearly a mile, and then came in sight of it again for a short distance, but the water was only a few inches in depth and their were no signs of trout grounds. After the longest four miles I ever recollect traveling over, we came to the lake, only to find that the road came out at Norway Point, five miles below the head. The traveling on the bank of this lake is as bad as anything can be, and as it began to rain, it was not to be thought of. So we took our back tracks in very bad humor, and the abuse which we heaped on those cranberry pickers relieved our feelings, without injuring them.

When we got back to where the road neared the stream, I proposed that part of us should follow the water down to the old bridge, as there might be some trout holes which would afford us a mess for dinner, but none of them believed there were any trout in that shallow water, so I was obliged to go alone. I wanted some fish—pork, hardtack and coffee having lost their charms for me while in the army. A very short distance down the stream brought me to an abrupt bend, a bit of meadow ground, a tiny rivulet of spring water trickling into the bend, and yes, actually deep water. With active and eager fingers I jointed up my rod and attached my reel. The rain which had fallen very lazily for two hours

now ceased altogether, although the skies still wore their threatening aspect a light breeze just ruffled the surface of the water, a long stretch of which I could see below me favorable for sport, with clean and grassy banks, and nothing to impede casting. A half pound trout rewarded my first cast, two more followed in quick succession, then I noticed a couple of logs lying close to the opposite bank, with a covering of driftwood. An extra long cast planted the seductive worm directly between their ends. Heavens! What a tug followed that cast. A mad rush for the further bank followed the turn of my wrist, and I checked him so suddenly that he sprang a foot out of water, flinging a shower of silvery spray in all directions. Being without any landing net I was obliged to play him till quite motionless, and then lift him carefully by the line. Just a pound and a quarter by the pocket scales; another of the same size was taken from the same place, and so I went, slowly down that reach of water for half a mile, taking the beauties from under the steep, grassy banks, and occasional bunches of overhanging bushes, totally oblivious to time, place and friends. The robin sang from the topmost branch of an old hackmatack, the purple grackle chattered among the spruces, the catbird squalled in the witch hazels, and the metallic notes of the hermit thrush tinkled melodiously from the dripping alders; all these sounds mingled with, and added to, my enjoyment. I remember, as a flock of ducks flew by me, within twenty paces, of vaguely longing, for a single instant, for my gun. Just as I came in sight of the bend, just below which I knew the bridge to be, my basket refused to receive another trout, and my worms were also exhausted. Quite a stretch of good fishing ground still remained between me and the bend, but I could do nothing without bait; besides I was frightfully hungry, as I had not eaten a mouthful since daybreak, and I found on consulting my watch that it was nearly 4 o'clock. I unstrapped my basket, emptied out my trout, and counted them back: forty-two, and six of them each a pound and upward in weight.

Just as I finished, I heard the dip of a paddle, and saw Walt and Lou turning the bend, in the canoe. "Halloo," cried Walt, "what for Heaven's sake have you been doing? Father says it is going to be a rainy night, and has started out the logging road, for the Extract, and we have got to hurry to get round before dark." "All right," I answered, "but just step ashore, and see if you can tell what kind of a fish this is, which I have caught." "Where is the fish?" he said, stepping out of the canoe. "In the basket," I replied. Walt lifted the lid and actually staggered back as he caught sight of the pile of trout. "Oh! What an infernal idiot I am;" he cried, "I wish some one would kick me. Here I have been laughing and cracking jokes at your expense for trying to wade through the wet bushes down this stream, when I might have known you wouldn't have staid all this time, and gone without your dinner, unless you were catching trout. We have brought our rods, but have forgotton the bait. Lou, hurry back and get some, I will never leave this place while there is a trout to be caught."

"Hold on, Walt," I said, "I think I can better that arrangement. I have forty-two trout in that basket, and six of them are all that you and I and Josi can eat for supper and breakfast. The remaining thirty-six will keep Lou off the ragged edge of starvation for two meals, I know. We will come up here at daybreak in the morning, catch what trout we can before breakfast, then they will be fresh to take home, and we shall have the balance of the afternoon to get a pile of wood which we shall need if it rains."

This was satisfactory, and we made haste to carry out the programme. Not a drop of rain fell during the night, and on repairing to the spot at dawn, we caught thirty trout in an hour. Lou immortalized his name, and covered himself with glory, by catching twelve of the largest ones, without stirring from one spot, between two big bunches of bushes. None of us saw him catch them, and I more than half believe that a mink brought them ashore for him; but the number he caught were nothing to what he ate when we got back to camp.

We were soon on our homeward way, Walt having several opportunities to try his gun on partridges. Just before reaching Jim's house, the rain began in earnest, and we arrived there drenched, but happy, enjoying his discomfirture, at having missed the sport. PENOBSCOT.

Natural History.

THE FLYING SQUIRREL.

(*Pteromys volucella.*)

BY DR. MORRIS GIBBS.

THIS interesting species is a resident in the Lower Peninsula of Michigan and, though not to be found abundantly in any locality, is well known to the majority of hunters and collectors. I am unable to say that the flying squirrel is found in the Upper Peninsula, nor can I attest to its distribution throughout the entire Lower Peninsula. From observations in several counties in various parts of the State, however, it is reasonable to conclude that this little squirrel is well distributed south of 45° north latitude.

Prof. A. Sager first mentions this handsome pet in a list of mammals published in a document of the State House of Representatives, 1839, and it has been also embraced in other lists. But little has been written on the habits of the flying squirrel, or, in fact, regarding the habits of any of the smaller Michigan mammals. The lists are merely nominal, and with the exception of a few articles on the larger game very little has been accomplished.

It may be truthfully said that the flying squirrel is nowhere common within our boundaries. Several families are occasionally found within a radius of a half mile in favored localities; again, an enthusiastic collector will search over many square miles without success.

In Southern Michigan (by which term the Lower Peninsula is here indicated) the haunts generally chosen are woods composed principally of white oak, *Quercus alba*. In fact, in my experience in Kalamazoo county, 42° 7′ to 42° 28′ N. lat., I have met with but one instance where the nest was not built in an oak, in this case it was placed in the dead top of a flourishing poplar, *Populus tremuloides*.

At Howard City, Montcalm county, latitude 43° 25′, the species is often found occupying timbered lands, both hard wood and pine, as well as in low tracts, partially covered with hemlock, bass wood, elm and underbrush. The nests are found on high ground in many instances, but as a rule are not far from water. A pond or small lake will generally be found within a few hundred yards of the stub occupied. In those cases where the little fellows occupy low tracts, the locations of the nests are usually near rivers or small streams.

The nest is generally a rude structure and consists mainly of dried grass, leaves and pulverized dried bark. The material is piled into the cavity and, as a rule, nearly fills it, but a free space is invariably left in the direction of the openings in the stub. In the autumn very compact and artistic nests can been seen, quite suggestive of comfort and warmth, but after occupancy for a length of time the materials become mixed into a terrible litter, and by spring have not so neat an appearance.

As to the amount of food that is stored up by this squirrel in the fall, I have but little knowledge, but from a few observations, where only a small quantity of winter supplies was found, I judge that but few squirrels are in any way thrifty in this respect. The flying squirrel is very sensitive to the cold, and when driven from its nest even in early November, acts quite differently from its usual custom in summer. Undoubtedly it curls itself into a ball when the first severe cold snap appears, and remains in a partially dormant state until the warm days of spring produce their stimulating effects, and our downy friend again appears to sail through the air and gladden our hearts with its graceful movements.

The majority of specimens secured by the collector, are taken at times when the presence of the glossy-coated creatures is least suspected. A regular hunt may be instituted, and a number of collectors go out to secure the specimens, but the chances are ten to one that not one will be taken, unless it is known where they are to be found. Again when returning home from a collecting trip in the evening, a shadow flits athwart the weary collector's path and a scrambling on the bark is heard as the graceful rodent ascends the tree to which it has sailed. After reaching a certain height the diminutive aeronaut again launches forth, and spreading its extremities sails to another tree, and continuing in a succession of so-called flights, is soon lost to view in the gathering darkness, or else conceals itself in some neighboring cavity.

With such precision does the animal calculate, that a failure to gain a desired foothold on the tree to which it springs is of very rare occurrence. When failure accompanies the attempt, it is generally a result of the frenzied condition of the terrified jumper, as is sometimes the case with the fox and black squirrels when hard pushed by merciless enemies.

When a black squirrel falls, in a vain attempt to jump from one slender twig to another, it comes lumbering down to the ground, or perhaps catches a twig twenty or thirty feet below the point at which it lost its hold. In some cases I have seen a black squirrel so stunned by a shock as to fall a ready victim to a club or a cruel hunter's boot. But the flying squirrel reaches the ground when necessary in a series of graceful spiral movements interesting in the extreme. When rudely shaken from a limb the little fellow spreads its membrane and with graceful movements of its tail wavers in the air in a series of undulating movements very amusing to the observer, and finely illustrating the principle of the parachute. At once on reaching the ground our little friend strikes out for the nearest trunk, fence or building in order to gain another flight, and unless the dogs are quick or the boys are active with their sticks, *Pteromys* will soon be again out of our reach.

I have a vivid recollection of hunting this squirrel one bright October day, some years ago, when several of us went together with the intention of securing live specimens for pets. Numbers of the animals were seen and many could have been shot, but as we were above shooting the delicate creatures, we only used our insect nets. All in vain. Several picturesque groups enlivened the proceedings, where boys, dogs and underbrush were indiscriminately mixed. It was really surprising to see how the squirrels eluded our attempts, but not one was taken alive. Finally poles were used to knock them off of the trunks, and we went home satisfied that our collection of skins would be enlarged even if we could not fill our carefully prepared cages.

The movements of our friend are very interesting, and he is a dull observer who would not admire the swoop of a flying squirrel. The greatest jump that I have seen made was something over forty feet, *i. e.*, from the base of one tree to another. The further apart the trees are, the straighter down the squirrel has to go. For instance, if the distance to be covered is thirty feet from the base of one tree to the other, the animal must jump from a height of not less than fifty feet, or else it will reach the ground from lack of force. If the jump to be made is only five or six feet, the space is covered almost in a direct horizontal line; whereas if eight or ten feet are to be covered, a downward swoop must be made at an angle of 25 or 30 degrees.

Those who have watched the movements of these airy creatures have observed that the older and stronger ones are much more capable of accomplishing a swoop, which undoubtedly arises from the fact that the animal is stronger, and, therefore, can spring with much more force, and, further, the space covered by the membrane is greater. I have seen a large male spring from the top of a tree, as if to sail to another tree, but only go a few feet from the trunk, perhaps four or five, then drop directly down thirty or forty feet and sail gracefully back to the tree it had left.

Such a move was undoubtedly premeditated. Perchance the animal intended sailing to the next tree, and after launching forth arrived at the conclusion that it had not sufficient force, or the distance was too great. However, it is reasonable to judge that it merely wanted to descend from its perch, and took this means, as it is not a rapid climber.

Always a shy, nervous mammal, it is nevertheless decidedly unwary in many instances, and frequently brings destruction on itself and family. If a place of resort is discovered, it is an easy matter to discover their habits, and when the dead trees are found in which they nest, the chances are all against them if the collectors are on hand. The holes in which they remain during the greater part of the day, if once located, can be relied upon as almost certain to produce specimens, and the collector can secure a series at any time during spring, summer or fall.

A thump at the base of the stub brings out the heads, and bright, piercing eyes are directed toward the disturbers of their repose; another thump, and the shining-coated fellows rustle out on the decayed bark and ascend to the top of the stub or tree.

I have never met with over five squirrels in one tree, and think that this number embraced the two old ones and the three young of the year. Such a series is only met with in the summer, and as two of the specimens were larger than the others and more complete in coat, the conclusion is undoubtedly allowable. In the spring three full grown specimens are occasionally found occupying one hole, but generally, from April to June, only a pair of old ones are found consorting.

In those cases where there is but one opening into a nest there is a better chance of securing the entire family. At the first thump the old male protrudes his nose and takes in the situation. The next thump brings out the male and another member of the family appears at the orifice. The first appearance is now shot as it reaches the top of the stub or after it alights on a neighboring tree. The report of the gun brings out another member, and in regular order all are secured.

If however, as generally occurs, all of the occupants appear at the various holes and sail out in different directions, no more than one or two will be secured, as some will surely be soon concealed in neighboring trees.

This unwary habit of leaving the nest when the tree or stub is struck with a club frequently results in the extermination of a whole family. The flying squirrel, as it is so improperly called, differs in this respect from other members of the family. A hunter would, indeed, be unsuccessful in an endeavor to bring out a black or fox squirrel.

The following dimensions are given of a female specimen taken in Michigan: Total length 12.02 inches, tail to tip 6.15 inches, length of long hair at end of tail 1 inch, length of skull 1.49 inches, breadth of skull at zygoma .84 inch.

If any one can furnish any information concerning the breeding habits of this interesting squirrel let the FOREST AND STREAM hear.

KALAMAZOO, Mich.

BIRDS OF THE GULF OF ST. LAWRENCE.

A PAPER entitled "Notes on the Birds Observed During a Summer Cruise in the Gulf of St. Lawrence," appears in the Proc. Boston Society for October last, from the pen of Mr. William Brewster. Besides being an ornithologist of eminence, this gentleman has also the art of recording his observations in a very charming style, so as to claim for himself considerable audience outside of those who are strictly scientific.

The cruise, during which the observations here recorded were made, took place during the summer of 1881, on the seventeen-ton schooner yacht Arethusa. The party consisted of five gentlemen in the interest of the Boston Society of Natural History, to which institution most of the specimens collected were afterward given. Among the points of interest visited were Cape Breton, the Magdalen Islands, different bays on Anticosti, Gaspé, the Mingan Islands and Percé Rock. As is usually the case on this coast, during the late summer the weather was anything but favorable. Mr. Brewster says, "Our log book records only eighteen moderately fair days out of the total sixty-two, and some of these were more or less interrupted by showers. Besides this, the season was too far advanced for egg collecting, so that, although the summer home of such desirable species as the blackpoll warbler. Lincoln's finch, the fox sparrow and others was reached, neither nests nor eggs could be secured."

The number of species noted is eighty-three, and, as might be imagined from the circumstances of the trip, an unusually large proportion, nearly one-half, are water birds.

Without going into details as to the species observed on this cruise or their habits, we may note an occasional point of unusual interest in the present paper. Testimony collected from Indians and white men along the north shore of the Gulf makes it appear probable that the range of the ruffed grouse extends much further north than has hitherto been supposed. A white man who for several days acted as pilot of the Arethusa informed Mr. Brewster that *Bonasa umbellus* "ranges over the entire region between the Gulf of St. Lawrence and Hudson Straits." The present paper contains a great deal that is interesting relative to the habits of our sea birds. One point which the author had painfully brought before him at every extensive breeding place of sea fowl was the constant persecution to which they are subjected. All species from the little terns up to the largest fowl are constantly robbed of their eggs, and such species as are large enough to be worth a charge of powder and shot are killed and eaten by the Indians or used for fish bait by the whites. There appear to be few places where these birds are free from molestation, Percé Rock being almost the only breeding place seen by Mr. Brewster which was quite inaccessible.

A suggestion in regard to the breeding of Wilson's petrel, *Oceanites oceanicus*, made by Mr. Brewster, is very interesting, and in the light of our present knowledge of the habits of this species seems quite plausibe. It is a well-known fact that this bird is abundant off our coast during the whole summer, yet nothing is known of its eggs or breeding grounds. A number of specimens secured by Mr. Brewster between June 17 and July 25 were dissected, and the sexual organs of all were found to be "at the very lowest stage of erotic development." In the females no signs of recent ovulation were detected. A male taken June 18, however, showed by its plumage and the condition of its bones that it was very recently from the nest. These facts lead Mr. Brewster to suspect that "Wilson's petrel breeds in winter or early spring in tropical or subtropical regions and visits the coast of the Northeastern United States *only in the interim between one breeding season and the next.*"

There are so many interesting points noted in the present paper that we can only allude to some of them, recommending it as a whole to all ornithologists.

WHAT A TOAD CAN DO.—*Editor Forest and Stream:* I made some amusing experiments yesterday regarding the stowage capacity of a toad, an "ordinary, everyday toad," as Thatcher, of the 'Frisco Minstrels, says. I caught flies and, squeezing all but the last kick out of them, dropped them one by one, say about two inches from his nose, and one by one he gobbled 'em, and between 4 and 7 o'clock P. M. he had tucked away 104. Three of us kept score for him. At this stage of the proceedings his little belly was ridiculously plump, and he grew so stupid that I gave it up and let him go. Up to the seventy-fifth he took them greedily, then the intervals were longer, but he did hate to let anything pass, and would stretch himself for all the world like a person after a big dinner. Lord knows what he might have done had his diet been more varied, but as it was straight fly every time you must acknowledge he did yeoman's work. I have known that toads were valuable as insect destroyers, but never put them to such a test as this before.—WILMOT (New York).

A TOUGH TURTLE.—On the 23d of last March I shot a turtle, putting the whole charge of shot in its head, as it was within ten feet of me, secured it, took it home, and cut off the head, intending to dress and cook it. It is what we here call the mossback, which grows, as I have observed, to the weight of twenty pounds, perhaps larger. Neglecting to

dress it for several days and having heard that a decapitated turtle would live nine days, I concluded to demonstrate the truth of the assertion. Strange to say the turtle on April 8 was still alive. I found attached to the turtle many leaches which I removed carefully and put in a glass jar of water. Some of them have brought forth young which are growing rapidly. Think they bring forth their young alive. Have any of the readers of FOREST AND STREAM ever noticed the manner in which the turtles dig the hole on hard ground in which they deposit their eggs? If so let them tell their observations and we will compare notes. I was presented on April 1 with a fine swan (*Cygnus americanus*) that was killed March 31, on Cedar Point Marsh, which I have mounted and added to my collection. Many thanks to the donor, Mr. Theodore Wells.—M. M. BENSCHOTER (Berlin Heights, Ohio).

ALBINO WOODCOCK.—The Baltimore (Md.) *Sun* of July 1 reports that "Mr. Rodman Cole, of thas city, killed a remarkable bird near Tolchester last week. He was after woodcock, and a pure white bird, with the flight and twitter peculiar to these birds, flew up and he brought it down. It was a true albino woodcock, of large size and absolutely spotless. He is having it stuffed and mounted." In the first volume of this journal (FOREST AND STREAM, I., p. 371) was recorded the capture of a snow-white woodcock, at Milton, Mass. In Vol. XII., p. 146, was record of a specimen taken at Augusta, Ga., pure white, save slight brown ring about the neck. Others have been recorded since then.

ROBINS AND FRUIT.—*Editor Forest and Stream:* Cannot some suggestion be made in the columns of your valuable paper by which the killing of so valuable a bird as the robin may be avoided by the farmers who grow small fruits and berries? A bird so useful should be protected (and is by law) from destruction, although but few persons outside of the naturalists fully appreciate the fact. Something of the nature of a "scarecrow" might be used instead of a charge of shot, if farmers would only make the attempt.—MOHICAN.

ALBINO ROBIN.—*Editor Forest and Stream:* I was interested in a recent note on an albino robin, as I have one, nicely put up, that I shot last fall while out partridge shooting. I first saw him flying in company with other robins. I followed them quite a distance and finally succeeded in bringing him down and found him to be surely a robin, but almost entirely white with pink eyes. I had the bird put up and he is a fine specimen.—F. N. M. (Forestville, Conn.).

Game Bag and Gun.

DAYS WITH THE PRAIRIE CHICKENS.

THE prairie chicken season is coming around again, and I take it that you may like to hear something of the fun we had with the birds on the prairie last fall. I was out the three opening days with my old shooting "pardner" and two other gentlemen, and we had a splendid time. We left here with a three-seated wagon and a driver on the afternoon of Aug. 14, and drove to the house of a farmer friend, who lives about twenty-five miles from here. That has been our headquarters for a number of years. We arrived there late in the afternoon, and after breakfast the next morning we got loaded up and pulled out for the prairie. Both rigs took the same general direction and agreed on a place to meet for dinner. I took time by the forelock and put the basket containing the company's dinner in the wagon I was going in (in case of emergency). We had four dogs, two old ones and two puppies who were on their first trip. We divided them up so as to give an old dog to each rig, my friend, R. M. Palmer, with whom I usually shoot, was in the other wagon, as he and I owned the two old dogs, and we had to separate them so that all parties would have an equal show. My partner the first day was Mr. Prentice, of this place. Most of our shooting was done over my old pointer, Don, who did not act a bit good and flushed very many birds before we could get a shot. I felt like excusing some recklessness on the part of the old villain, as it was his first trip of the season, but I made up my mind that if he did not reform I should cut a bean pole and go at him. We did not find as many birds as some previous years, but found enough to have a good time. To make a long story short, when we got to the house at night our bag was twenty-seven birds and the other party led us, having forty-five. After supper we drew the birds and stuffed them with hay and hung them where they would get cool, and the next morning packed them and sent them to a railroad station eight miles away and shipped them home and had them distributed among our friends.

The next day was very hot and we did not do much; the dogs could not do much either, and we all lay in the shade from 10 o'clock until 4 in the afternoon. The total bag for that day was, if I remember right, about thirty-five birds, which were disposed of in the same way as the others. The next day I had a change of partners, and had for my companion Mr. Sunderland, of Freeport, Ill., who was here on a visit, and he was one of the most companionable men I have ever shot with, a rattling good shot (much better than myself) and full of fun. We had a circus of our own all day. It was a model day for chicken shooting—cool and cloudy, with a dash of rain, just enough to moisten things up—so that the dogs could show what was in them. My old dog redeemed his character and worked as well as a man could ask.

We found more birds than on either of the previous days, and we managed to get them down in pretty good shape. One part of the day's picnic was this: the old dog commenced to wriggle himself in a way that showed me he was in the vicinity of chickens, so we got out of the wagon and went over to where he was. By the time we got there he had begun trailing, and from his action I knew the hens were running. In the damp grass we could see a lot of parallel lines, showing that it was a covey. The scent was hot, and the old dog was going along, his belly almost touching the grass, and putting every foot down as if he was walking on something that was going to break with him. He went along this way for some distance and finally began to straighten out, but just before he did so, he turned his head a little to see if we were on deck, and said just as plain as if he had spoke right out, "Here they are, boys. I've done my part of the business; come and do yours." I told him to go on, and he made a few quick steps and the air was full of chickens. "We got our work in" on them and "downed" four. The rest of the covey flew over the prairie; we could see them until they went over a hill, it was a rolling prairie. We saw them go over one swell but did not see them go over the next one, so we decided that they were somewhere between the two. We got into the wagon and drove over there, perhaps a quarter of a mile, and after plugging around for quite a while we found them; and my companion, Mr. S., nearly stepped on one, which caused the bird to get up, and about the time he got up he got down again. We were right among them, and they began to get up all around about as fast as we could attend to to them. We had seven birds down before we picked up one, and after we had got them picked up two more flipped up, where we had been tramping and shooting all this time, and we gathered them in. There were two of the covey left for seed, one getting up out of range, the other while both guns were empty. This gave us nine birds, and the four we got the first raise made thirteen from that covey. You can imagine it was quite rich while it lasted. We did not strike any more bonanzas of that kind, but had a most beautiful day all day, and when we got through at night had forty-four birds.

The other boys did not have as good luck in finding birds that day as we did. They brought in about twenty-five. Our host had brought a big piece of ice back with him when he came from town, so we drew the birds and packed them in ice, and the next morning decided to pull out for home, as the dogs were getting lame and we were somewhat stiff ourselves. The first two days had been very hard on the canine part of the company. It was quite warm, and there had not been any rain for a long time and the grass and stubble were harsh and wore their feet more than hunting twice the length of time usually would. It being their first trip, too, they were not in as good order as later in the season.

The place where we hunted is in the midst of the best chicken country I know of, and where we stopped is a capital place to stay. We of course always pay them, but they have always been very kind and did a great many things that they never got any pay for. I have put in the opening days of the season there for a number of years, and always had a big time.

It was a good thing we decided to go home as we did, as it turned out to be a very hot day, and we could not have done anything if we had tried. We were from 9 o'clock until 3 in the afternoon getting home, and our team were nearly played out before we arrived. We got all of our birds home in good shape and did not lose one.

This was the longest hunt of the season with me. I was out for two days after that and out for a day a number of times, and had varying success, once being completely "skunked." It is becoming so in this part of the country that a man cannot go out for a day and do much. Everybody that can lift a gun shoots, and the game within easy distance from town is soon killed off. I did not shoot any ducks to speak of this fall, although there was the best duck shooting here they have had for a number of years.

E. L. J., JR.

ALBERT LEA, Minn.

THE GAME OF DES ARC.

YEARS ago Arkansas ceased to be spoken of as desirable hunting range, but the renowned "Traveller's" State still offers some attractions to the lovers of gunning and angling, though the "perfect glory" of other days has departed forever. There are but few localities in the South and West of which the same cannot be said.

Large game of the dangerous class is very scarce. I heard last season of but four panthers being killed in this section of country. They had taken refuge from the Cache River overflow in an overhanging oak, and were discovered and killed by a settler named York, after a hard fight with one of them, which followed him through the shallow water and overtook the dugout in spite of York's frantic efforts with the paddle.

Bear are very seldom seen in this region, though they are scattered through the entire lowlands, if one may judge from the numerous tracks found in the vicinity of the tangled canebrakes. Good bear dogs would no doubt stir up their game in a few hours; without dogs it is useless to think of hunting them; and even when brought to bay, it is doubtful if the hunter could reach his dogs, through the matted cane, vines and briers, in time to save them from destruction. Bruin is never found here in the open woods of the uplands.

Deer are still quite plentiful, and I suppose they will remain so for a century to come. It is simply impossible to completely exterminate them, as the vast swamplands to the eastward serve as a perfect reservoir of all kinds of game, from whence we have a new supply as often as the old one is exhausted. Last Sunday I rode down to the bayou to note the stage of the waters, and while seated beneath the shade of a tree, two deer came down to the water's edge near me, and swam calmly across, remaining in rifle range for ten or fifteen minutes. It was truly a tantalizing sight.

The gobbling season for turkeys lasted fully two months this spring. Each morning the "king" of game birds sang his glad welcome to the glorious dawn, and every broken remnant of a firearm was brought into requisition. The slaughter was something simply enormous. Most of those killed were gobblers—old ones—from eighteen to thirty pounds weight. The young gobblers secured immunity from danger by wisely abstaining from the garrulous habits of their elders, together with the hens, rendered by nature incapable of the amount of chin-music generally expected from females as a class.

The favorite sport just now is spearing and shooting fish. Owing to the late and continuous overflow of the spring, the buffalo were unusually late in beginning to "float" and "suck" at saplings and floating straws, and very few were killed until the first of this month. It is splendid sport for a short time, but the fish are so numerous that it gets rather monotonous to me after a while. For choice I prefer to throw the iron into the lazy gars, that lie as straight and inert as a stick on the surface of the bayou, and are apparently transformed into sections of doubled-triggered chain lightning as soon as they feel the stroke. Two weeks ago I saw a choice article of this description. It was fully eight feet in length, and would have weighed probably 150 pounds. He was lying fair twenty feet from the boat, but the youth who was paddling squarely refused to go an inch closer, as he hardly fancied the idea of "fastening on to him." I dipped the boat nearly full of water in a vain attempt to reach the giant with an eight-foot gig-handle and ten feet of cord, and my bad luck probably saved me a nice wetting, for he would certainly have "died game."

Black bass are just begining to raise at bait. I think Bayou Des Arc will fully equal Reelfoot Lake for the game fish of the South.

Of small game we have an abundance. Squirrels are so plentiful that they attract but little notice. Quail, or partridge, as the natives call them, are whistling in every thicket, and follow the furrows in a stone's throw of the plowman. Rabbits and turtle doves are called game in some sections; here we rarely waste a shot on them. Duck shooting is splendid every fall. One of my neighbors killed and sold over one thousand mallards in the months of November and December last.

I might go ahead and say more in praise of this region as a happy hunting ground, but I can better express my opinion by remarking that this point is my choice for a permanent location, after shooting over the best grounds in the pine swamps and on the frontier prairies of the Lone Star State.

S. D. B.

DES ARC, Prairie County, Ark., June 2, 1884.

TWO-EYED SHOOTING.

I SHOOT with a rifle, shotgun or revolver. I raise my gun to my right shoulder, and close my left eye to aim. I hold a pistol in my right hand, close my left eye, and fire the moment my eye catches the sight as I raise the pistol to coincide with the line from my eye to the object. I have shot nickels out of split sticks at thirty steps with my pistol four times out of five repeatedly; have shot the spots out of the five of clubs, and fired my sixth shot into the spot on the ace of clubs at the same distance; have shot glass balls in the air, and killed a deer by shooting it through the heart at fifty yards, measured.

I use an old-style Smith & Wesson in shot, square handle, six-inch barrel, .32-caliber, long cylinder, but for several years have shot nothing but .32 ex. short; rim fire. I believe all other .32-caliber cartridges too heavy for pistols. I use a .38-caliber repeating rifle; have never had a shell stick in the field, nor do I believe any other man ever had if his extractor was right. After repeated loading into and pumping out of the magazine the bullet is often driven further into the shell than it was originally, and if pure lead is flattened at the point, and a very quick motion of the lever will cause either this flattened bullet or the edge of the shell to catch on the upper edge of the barrel, particularly if the gun be held with muzzle down. Scarcely any *ipse dixit* would make me believe that a properly loaded new cartridge ever did stick or could be stuck in a repeater.

I use a Clark & Sneider double gun, 12-gauge hammer gun, have broken eighteen glass balls out of possible twenty, thrown from a rotating trap, double, eighteen feet from me, trap behind a heavy blanket for a curtain. I used No. 10 shot, one ounce, three and a fourth drams "sea-shooting" powder.

In regard to glass balls breaking from one or two pellets: I was shooting last summer at glass balls with a Stevens gallery rifle .22-caliber, balls pitched into the air by a friend. During the shooting I knocked both sides out of each of two amber balls, leaving in each case a circular ring of glass, surmounted by the neck of the ball, I have these balls yet, I preserved them because I deemed the circumstance rather unique.

The first person of whom I ever knew shooting "with both eyes open" was my grandfather, who was born in 1790 and died in 1863. His shooting was done with the flint-locks and the old percussion locks, and the crooked-stocked "five-foot rifles" of the days gone by. Of course you know that in those days two hundred yards was a cruel distance, but I have often heard the circumstance mentioned by others of grandfather's killing a crow when it was 210 steps from where he stood to the foot of the tree on which the crow sat. He was an unerring shot and gave me my first lessons with a rifle. I may add that he shot "cross fire," that is, he raised his gun to his left shoulder, though right-handed, and I have never seen a cross fire shot who was not a marksman. What do your readers say to this?

A friend of mine, a Methodist Episcopal minister, was the next and only other "two-eyed shot" I have ever known. He uses a repeating rifle, and is, perhaps, better known than any other amateur in this section, but he should rather be called an expert. He differs from my grandfather in his explanation of "two-eyed shooting." Grandfather has often told me that it "made no difference to him about the sights on his gun, and he didn't believe he ever saw them." My clerical friend says he "sees the sights," and the rear sight on his gun is a very fine one graduated to 1,000 yards; so fine, that I cannot "catch a quick bead" through it. In proof that he does see the sights, I know that on one occasion he missed twelve consecutive balls pitched by me; he then tried at a stationary target six steps away, and found that the rear sight had been moved. This is strong evidence, but I do not believe any two-eyed shot sees the sights, I believe they shoot, as bowmen do, by instinct.

I would much like to see something from your readers on cross-fired shooting. AMATEUR.

SOMERSET, Pa.

A MAINE DEER CASE.

CONCERNING game protection in some sections of Maine, matters are not just as they should be. Deer have greatly increased under the fostering care of the law. They are frequently seen in the open land where formerly they were very rare, and in the lake region they are getting to be quite abundant. But the vacationist who would be a sportsman is interested. When he goes to the Androscoggin or the Moosehead Lakes to spend his few weeeks from school or business, he takes his rifle or shotgun with him. For what? He knows that there is not a single species of game in that whole State that is not protected by law, and the man who kills it is liable to arrest and punishment. Just such sportsmen are causing the friends of game protection a great deal of trouble. They demoralize the lowest and worst class of the guides with their money. They care nothing for the future of the game; they are not citizens of the State; their only object is to kill a deer or a moose, and come home to be regarded as a great hunter by their friends. Generally their friends understand them, however, and knowing them to be only lazy dudes, mistrust that the game was killed or thrown in their way by some guide.

An actual case in point will best illustrate. A Sunday or two ago a two-year-old buck swam out upon Rangeley Lake in plain sight of the Mountain View House. A vacationist—he don't deserve the name of a sportsman—named Hammond, from Boston or New Haven—the registers disagree, but he is not worthy of either city—ordered a guide to paddle him out after the deer. The guide's muscles soon brought the valiant hunter up with the poor, frightened creature, when, having no gun, the deer's brains were beaten out with a paddle and his throat cut. To the great discredit of all present the miserable law breaker and deer thief was

allowed to box up the carcass out of sight and send it home as a noble trophy of his skill as a hunter.

Well, that deer was killed in close time, and Mr. Hammond—it is to be hoped that these lines will be thrust under his nose, and that all his friends will see them—paid a fine of $50 and costs for the offense. He ought to have been more severely punished, and would have been, had the sentiment of those who knew of it been up to the standard of true sportsmen. As it is, a warden has been put on the watch for him, and if he ever comes into the State again, he will be fined for killing game on Sunday and also for transporting it out of the State. SPECIAL.

BOSTON, July 7, 1884.

THE DEATH OF THE GRIZZLY.

Editor Forest and Stream:

It may not be amiss in these days of crying out for rifles of greater power for the slaughter of big and dangerous game, to tell a little true story of how simple a thing it is to kill the most formidable monster of America.

Many years ago, during the heat of the gold fever, three miners were in camp in British Columbia digging for gold. Just at a time when their stock of provisions was nearly exhausted they took sick with malarial fever, and by the time they were recovering they had nothing to eat, and worse still, no ammunition in camp. One of them, a Scotchman, named Donald McTavish, who had just recovered and felt stronger than the others, saw a large grizzly bear one morning quite near the camp. He told his comrades and said he intended to try to kill the animal. They endeavored to dissuade him from the dangerous act, and represented to him that the bear would tear him in pieces. He replied that he would as soon be killed suddenly as die of starvation. He then cut a heavy green wood bludgeon and started toward the monster. The bear came on to meet him, and when at close quarters, reared on his hindlegs. The bold Highlander swung his heavy club with both hands and by strange good luck it struck him a terrible blow across the nose, and down he went as if stricken by a flash of lightning. The animal was completely stunned, and a few thrusts of a long-bladed knife finished the business. Those skilled in ursine lore are well aware of the fact that the nose is the most vulnerable part of a bear, in consequence of the concentration in that organ of the nerves of sensation from the brain. At close, hand to hand range, with an ounce and a half of No. 3 shot and five drams of good strong powder behind it, I am of opinion that the largest grizzly in America can be killed more suddenly than a 350-grain bullet can do the work even if it passed through the center of the heart. I think no man with a No. 10 bouble breechloader, thus charged, need be one bit afraid of the grizzly, if he only keeps cool and remembers that the nose is the seat of death. I don't mean to advocate the shotgun for grizzly hunting. I only state my belief. ALGONQUIN.

OTTAWA, Canada, June 23, 1884.

FORTY YEARS IN THE FIELD.

Editor Forest and Stream:

I have had the pleasure the past year of perusing the columns of your valuable paper, which have been both amusing and interesting, and having been in the field over forty years I am led to notice the change in style of hunting, which is very great. When I commenced handling the gun in my younger days, a majority of the people would say, "that boy will be a ruined child," and there was so much opposition that I would keep the old flint musket out in the bush to avoid being detected. I recall vividly an incident of my boyhood. A lad about my age was always ready for a little fun. The first opportunity we made tracks for the gun in the bush; we loaded the old musket and very soon spied two gray squirrels on a tree; we were about ready to give them the contents of the gun, having a good rest beside a tree. With much surprise we found the flint gone, which was a great loss to us. We concluded to go to the nearest neighbor and procure a lighted lantern. The boy made a very quick job of it. I had the plan perfected how to fire the old musket off; it was this: To light a hard stick with the candle in the lantern. I put the musket on the rest; the word was "make ready, take aim, fire." Then I quickly put the lighted stick to the pan of the lock. Slambang was the report of the old gun, with a stream of fire at both ends. Down came one squirrel, and the other one was treated likewise.

After a few years had passed, I heard of some one shooting birds when flying. This looked to me a very difficult thing to do with the gun. I resolved the first opportunity, I would see how the wonderful feat was performed. Fortune at last favored me. I had at that time a very cheap gun; however, the old thing would occasionally get a bird down. It looked like a crooked iron bar in comparison with the guns at the present day. My wadding was of tow, paper, and hornet's nest. Thirty-eight years ago I found a very fine little gun, 16-bore, 6½ lbs. This is the gun I use to day. Six years since I had it changed to a breechloader. I soon learned that the penetration was not as good; a little more powder is all right; how is that? I have used many other guns, but no other so reliable.

About thirty years ago I had a call from the Hon. George Ashmun of this State to accompany him for a few days shooting. I accepted, thinking it quite an honor to be in the field with such a noted man. He was very fond of woodcock shooting, so much so that he seldom raised his gun for partridge or quail in those days. As a sportsman he had many peculiarities. His time for shooting was six weeks, commencing October first; he gave me the handling of the dog, as I was a little more expert in the brush, and he was somewhat obliged to make his footsteps easy; yet he was generally found in the right position. When I gave him the word "point;" never mind the footsteps then, he was soon there and spied the dog; he invariably uncovered his head as though he intended to make a speech, then a few words to the faithful dog, very soon giving me the word "ready," I would put the bird to wing in his favor if I could. Mr. A. was a very good shot; if he missed the bird he never was disposed to pursue that bird further. If it was wounded he would make quite an effort to bag the bird. We kept up this old-fashioned way of shooting, down to twenty-two years since. In the meantime we lost our dog, I very soon had the good fortune to find one. Mr. A. bought the dog of S. T. Hammond, of Springfield, Mass., and was very fortunate in the purchase, for he proved to be first-class, and was very highly prized by his master. We shot over this dog five years; he gave us some fine work. At this time Mr. Ashmun was obliged to lay by the gun on account of feeble health; he was always interesting and instructive.

From this time Mr. Hammond and myself took the field, when we continued much the same style, with a little variation, which required us to empty our pockets oftener. It was a pleasure to me to be in the field with such gentlemen, from the fact that everything was smooth and agreeable; they delighted to do, or see, a good act executed with the dog or gun. While I review the past and compare it with the present, I yet find it a little pleasure to take the dog and gun and travel over those grounds where we have been so successful in gone by days, and bag a few birds, verily by the sweat of the brow.

The scarcity of game birds in most of our New England States at the present time is easily accounted for, about six to every town are killing the game birds in various ways, most of them for market. Our laws in Massachusetts are a good example to the States where game is plenty. In Massachusetts, if we could have had them passed twenty years ago, they would have been of great value. In my judgment it makes but little difference when the game is killed, a few days before, or two weeks after the law is off, as the destruction increases every year. We will see on the first of August an army of hunters and sportsmen; the hunters start early and stay late, with the breechloader and spaniel dog, one would think by their speed they were going to fight a fire.

They do not find time to dress in the morning, and almost need self-buttoning garments. If the object of shooting is to kill off the game it is not the swiftest method to employ. It would take but a few days to poison about all of our game in the State of Massachusetts. Now let us all say we have all been engaged more or less, in shooting off our own fingers and enact a law to put them on. DON'T PUTTER.

MASSACHUSETTS.

ADIRONDACK DEER COMPLICATIONS.

Editor Forest and Stream:

Some weeks ago there was published a communication on the subject of enforcement of our game laws. The writer asked some questions, the answer to which would be very hard to give, but in the opinion of the writer the game protectors were not doing their duty. I have been waiting some time for the settlement of some cases in this county that I might be able to show these faultfinders some of the difficulties under which the protectors labor.

Last September several parties were indicted by our Grand Jury, both for killing deer and fishing for trout out of season. All of these cases should have been brought before the December court for trial, but through some chance the district attorney did not furnish the sheriff with the necessary papers till the last day of court, and as none of the parties were nearer than fifteen miles and most of them thirty-five miles away nothing was done. Before the next court (in March) a new district attorney had come in. He started right, gave the papers to the sheriff, who, in some way, got so far behind in his business that they were not served in time for that court. Some subpœnas for one case, which the protector was very anxious to bring before the jury at that time, were put into the mail and did not reach the man who was to serve them till after the grand jury had been discharged. The witnesses went to Malone and could only go home again. At the court just held two of the parties who were indicted last September were fined $15 each, for killing deer last June, two other men were placed under bonds to appear at the September court. The case of one man who is known to have killed at least six deer in the months of June and July, 1883, was brought before the Grand Jury and no bill was found. There were in that jury at least two men who have always had the reputation of killing all the deer and fish they could, at any time during the year. Several of the witnesses who had told of seeing the venison, and eating of it, had also seen the fresh hides, swore before the jury that they had never known of the party being hunting nor having venison nor hides in possession out of season. With such swearing what can the game protector do? Can you or your correspondent help him?

I think our game protector (Mr. John Liberty) has tried to do his duty, but with so many things against him, very little can be done. It has been suggested that these cases be now taken before a justice of the peace, with a good sharp lawyer to examine the witnesses in the regular way. I think it would be the better plan, as a justice can be found within the county so far away from the offenders that he will have no personal interest in them. This seems to me the only way to reach such cases. The witnesses would be more thoroughly questioned than by the foreman of a Grand Jury, who is very rarely posted in the law.

What has been done has in most cases had a good effect, but the failure to indict some of the most notorious offenders has only encouraged others. One of the parties now under bonds to appear at the Sept mber court told me he had always killed deer when he wished to, and always would, and would catch fish when he pleased, law or no law.

In the cases of the two who were fined, both poor men, they say they have had enough and have stopped. One of them was induced to hunt last June by a hotel keeper, who told him he would pay cash for all he would bring, and he got so much venison on hand in July he could not use it, and sent two saddles to another hotel fifteen miles away. I had a long talk with this hotel man, and he says his customers call for venison and he must furnish it. I said to him I had no such trouble, and I am ten miles further in the woods than he is. I will not allow either venison or partridges to be cooked in my house out of season, and the guests of the house think I am right. By so doing, we can have good shooting in season, with venison and partridges in good condition. There is now every indication of fine hunting this season. Deer are seen about the lake every day, and we see many broods of young partridges.

One man from Malone, here last week, tried to hire one of the guides to go night-hunting with him. I did not hear of it till the man had gone home, but was very glad to learn that none of the guides would listen to him. The answer was that the deer would be worth more to them in September. This is what I have tried for ten years to make them understand. They ought to know it by this time. Such sportsmen are the ones who ought to be fined, and I think the guides are disposed to make such men pay a little more respect to the laws.

A party of three young men from Syracuse last year camped at Gull Pond, Herkimer county. They went in about Aug. 1. In six weeks they killed twenty-three deer that they got, and they say they wounded many others that they did not get. They killed five in one night in a strife to see who should kill the most. They could not use much of the meat, and let most of it waste. They were within the law; but what a record to boast of! I think they have much to be ashamed of. The Maine law ought to be put in force in such cases at least.

Our fishing season has been a splendid one; the fly-fishing is now first-class At the mouth of the brook, within eight rods of where I sit while writing, the small trout are jumping by the hundreds. This is the stream into which most of my young fry are turned each year. Those now jumping are evidently about two years old, on their way up to the headwaters of the brook looking for spawning grounds. The guests of the house acknowledge the corn. Stocking pays. A. R. FULLER.

MEACHAM LAKE, N. Y., June 16.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

Will you allow a stranger to "dip in an oar" in the controversy going on in your valuable columns in regard to the "choice of hunting rifles." Without attempting to argue the matter in a scientific point of view, I will briefly endeavor to state my views in the selection of a weapon adapted to the wants of the practical hunters. As far as a rifle or shotgun alone is concerned, I think we have nearly reached the ultimatum, but I think that nearly every hunter will concur with me in the assertion that they don't either of them alone "fill the bill" for an "all round" gun for shooting from a gray squirrel up to a grizzly bear. Of course no rifle that is adapted to squirrel shooting would have any more effect on a grizzly than a popgun; still I think we might have a gun suitable for either. Now, my ideal gun is a three-barrel, of which we have already one (the Baker), but I think this gun might be simplified and improved to meet still further requirements. For instance, why not have an independent lock of its own, something on the hammerless plan, for the rifle barrel, instead of having it complicated with the left shot barrel hammer, as they are now made? Now, why don't some of our enterprising gun manufacturers start up a competition in the manufacture of these arms and not let one firm monopolize the entire market as is the case with the Baker three-barrel? I consider that a three-barrel gun, two shot and one rifle, if properly constructed, would be the *par excellence* of shooting irons for the game hunter—say a .40-caliber rifle, and 12 to 16-gauge shot barrel, 28 or 30-inch barrels, and of a weight to suit the individual who uses it. I would regard it as a desirable gun for squirrel, duck, deer and bear, and with this *multum in parvo*, a person would have all the gun he ever would need for practical purposes. W. H. DUB.

Editor Forest and Stream:

I have had some experience in the use of a repeater while traveling on the plains of Kansas and Colorado, also while living on Gypsum Creek, a tributary of the Red River, in the Indian Territory; while in my hands the repeater saw two and a half years of hard service. I have heard many people in the East say that a repeating rifle was liable to break or fail to work when needed, did not shoot hard enough, and a few more complaints of the same kind. Now, for the two and a half years I carried mine, I never had it break or fail me in any way, except to miss occasionally, and that was my fault and not the rifle. At sixty steps I could cut the bottom out of a tomato can in five shots, and one of the boys shut down the air brakes of a grizzly in four shots with it; and yet I guess there are some who will say that because it is only a .44-40-200, it will not shoot hard. To those who want a bigger gun I would commend some special make of rifle, chambered to shoot the one-inch Gatling cartridge; then let them employ some one to carry their cartridges. I think a plain coarse leaf sight and knife blade foresight the best for sporting purposes, as with a coarse sight you can catch aim quicker than with a fine sight. I know of many cowboys who carry carbines in preference to rifles on account of the coarse carbine sight. Those who wish to learn the use of the sporting rifle, should go out in the West and rough it for a spell among the cowboys, who will treat them "white" and initiate them into all the mysteries of the art, while we Eastern theorists dream of trajectory, vernier and wind-gauge sights and many other mysteries of the Moors of Creed. COWBOY.

BALTIMORE, Md.

Editor Forest and Stream:

The pressure of official duties has kept me from sooner noticing the recent articles by "G." and "Skinner," and even now I can give a very brief answer. "G." is welcome to adhere so his singleloader, but he must admit that even with it the man behind the gun has many things to guard against to meet with success. I have seen just as many accidents and failures with singleloaders as with magazine guns, and but little want of care is requisite to have a jammed gun that will be of as little use as a crowbar. C. D.

FORT MCKINNY, Wyoming, June 29.

WAS COWPER A WING SHOT?—Cowper, although a most beautiful writer, evidences in his poem "The Symptoms of Love," that he could not have been—using the hackneyed term—a true sportsman. In the second verse of the poem he says:

> "Let her guess what I muse on when rambling alone,
> I stride o'er the stubble each day with my gun,
> Never ready to shoot till the covey is flown."

Now, did Cowper expect to pot the covey? Could he shoot flying? We think not. What an abominable condition he must have fallen into not to have had his love reveries completely broken up by the whirr of the startled birds. We cannot think he uses a poetic license, and fear the poet was either unacquainted with the habits of the quail he hoped to see "before they had flown," or was very "slow on the trigger." Such lines sound harsh to a wing-shot. Granting the poetic license, does it not detract from the romance in reading such otherwise beautiful verses to suspect for one moment Cowper should be guilty of such a detestable act as he intimates? "The Symptoms of Love" is utterly ruined by this one tell-tale stanza.—HOMO.

A DEER IN A TREE.—While in the mountains hunting a bee tree the other day, Mr. J. A. Devilbiss came across the skeleton of a very large buck which had got hung by its horns in the forks of a pine tree, and being unable to extricate himself had slowly starved to death. What must have been the sufferings of the poor beast thus imprisoned? Mr. Devilbiss says the tree was worn by the horns in the deer's vain efforts to escape, at least an inch and a half in depth, and the ground was pawed up all around the base of the tree. The buck was a large one, as the horns were at least fifteen inches long and hard.—*Winters Express, June 20.*

GAME PROSECUTIONS.—The New York Association for the Protection of Game has for some time past been pushing vigorously in a quiet way a number of important suits. "We have a number of cases on hand at present," said the partner of Mr. Whitehead, secretary of the Association, to a *Herald* reporter the other day, "the most important being the New York Association for the Protection of Game against the Washington Street Warehouse Company (Limited), No. 173 Washington street, this city. The detectives of the Association discovered that the warehouse company had in its possession a very large number of quail. On April 18 a search warrant was procured, it probably being the first one of the kind ever granted. Our men found in the cellar of No. 173 Washington street seven barrels of quail. The birds were marked 'poultry.' Each contained 374 quail, there being 2,618 birds altogether. As the fine is $25 each bird, the penalty would amount to $65,450. It was, however, thought expedient to only sue on 200 quail for the sum of $5,000. The suit comes up in the Supreme Court." The other suits are against sundry dealers in this city. They are brought in the City Court, in this city, in the name of Robert B. Roosevelt, who is the president of the Association. They are as follows: Charles E. Nauss, No. 87 Second avenue, 60 quail; penalty, $1,500. Charles Kolz, No. 1,412 Third avenue, 19 quail and 5 prairie chickens; penalty, $600. Ed. Eckard, No. 37 Bond street, 10 quail, 2 hares and 11 rabbits; penalty, $575. Frederick Pfluger, No. 949 Sixth avenue, 48 partridges; penalty, $1,200. Isaac Steigerwald, No. 199 First avenue, 19 quail; penalty, $450. Henry Steckler, Second avenue and Seventy-third street, 2 partridges; penalty, $50.

MANITOBA.—Ottawa, June 23.—*Editor Forest and Stream:* In your "Answers to Correspondents," in your issue of June 19, I notice that you say "the word Manitoba is pronounced with the accent on the last syllable, Manito-ba, the final a having the same sound of a in father." That is the French mode of pronouncing the word, but it is not the correct one. Indian words are not subject to the rules of either French or English pronunciation. Manitoba is an Indian, not a French word, and according to aboriginal accentuation, the orthodox method of pronouncing it is Manito'ba, with the accent strongly marked on the penultimate. This would seem to be the case also with all Indian words of more than three syllables. For instance, Stadaco'na, Donnaco'na, Mononghahe'la, Hockela'ga, Osceo'la, Caughnawa'ga, Susquehanna, Madawas'ca, Petawa'wa, Powantona'mo, Catara'qui, Ononda'ga, Tuscaro'ra, Winneba'go, and so on, *ad infinitum*. As will be seen, according to this arbitrary rule of American aboriginal accentuation, the home of the Manitoo, or the land of the Great Spirit, ought to be pronounced Manito'ba. As an initiated member of the Algonquin tribe of North American Indians, I have ventured to take exception to what I consider and know to be an error.—WAH-BAH-MI-MI (Anglice, the White Bird).

OREGON GAME ABUNDANT.—Cove, Oregon, June 23.—Prospects for abundance of game and fine shooting were never better than they are for this fall. Innumerable young ducks—mallards and bluewing teals principally—are sporting in the sloughs and river, numerous flocks of a dozen each of young sharptail grouse are met with in the meadows, while young geese not yet able to take wing scurry away to hide themselves in the tall slough grass. Along the foothills and in the mountains, young blue grouse are as abundant as they were ever known to be before. After all they are the game *par excellence*. Large, strong flyers and lying well, also unsurpassed on the table, they afford exquisite pleasure in their pursuit and much joy for the inner man. Last week the railroad was finished into this valley—the Grand Ronde, and doubtlessly sportsmen from abroad will be attracted thither by the large and varied game supplies. Duck shooting commences Sept. 1, and then almost any species may be found excepting wood ducks and canvas-backs. "Boone" is at fault when he says sage hens never eat grain. I have shot them in barley fields and found grain in them upon opening the birds. Of course they subsist principally upon the sage.—J. G. S.

A TROPHY.—I am the happy possessor of the mounted head of a black-tailed deer, which has a set of antlers I think hard to beat. There are twelve prongs on the left horn and thirteen on the right. This buck was killed in Middle Park, Colorado, last fall, and was a Christmas present from my brother.—C. G. FERRY.

FARIBAULT, Minn.—The outlook for chicken shooting is splendid. Large numbers of old chickens left from last year's shoot; and the spring has been very favorable for hatching, every one anticipates good shooting.—R. E. S.

DEER IN CALIFORNIA.—The close season for male deer expired on Monday, June 30. Male deer may be shot in the months of July, August, September, and October. Does and spotted fawns must not be shot at any season of the year.

HIGH POINT, N. C., June 35.—The outlook for quail is excellent. I think we shall have three times as many birds here this year as we had last season.—A. E. S.

MARYLAND QUAIL.—Cecil County, July 4.—The quail wintered well and there is promise of fine shooting when the season opens.—T.

FISH LINES.

Editor Forest and Stream:

I send you herewith twelve rhymes. Will you publish the rhymes and ask your readers to fill in the blank spaces; and send to me, in care of your office. Here they are:

—hole
—pole
—out
—trout
—sky
—fly
—sheen
—green
—flash
—splash
—pool
—fool.

MEAT-HAWK.

Camp Fire Flickerings.

"That reminds me."

125.

In the early days of the Western Reserve, when wolves were more numerous than settlements, a man by the name of Guild, living not a thousand miles from Geauga county, had occasion to go to mill, some four miles distant, —the only road being a trail through the woods—and not being the fortunate owner of a horse, had to pack his own grist. Returning late in the afternoon had got within about half a mile of home when on happening to look back he saw two wolves some twenty rods away, following his track. Off went the grist and up a tree he started, calling for help till he made the woods ring. His father and brother, who were working near the house, hearing the cry, each taking a gun hastened to the rescue. As they came up a little rise of ground near the source of all this noise the sight that met their eyes was one not soon to be forgotten. There the fellow was bare-headed and every hair on end, with arms and legs tight clasped around a tree, sitting flat on the ground, and the wolves squatted on their haunches some ten rods away evidently enjoying the sport. TAMARACK.

EAST BLOOMFIELD, O.

Sea and River Fishing.

A MID-SUMMER LAKE SCENE.

ONE sultry afternoon in July I was fishing in a boat on Lake Onaway, a few rods from the south shore. At about 5 o'clock the heavens became overcast, and for a few moments I was in the midst of a heavy shower. Soon the clouds opened, and the sun, just over the peak of old Bear Stone Mountain in the west, shone out in its full splendor. At the eastward arises the majestic Mt. Benson, covered with a forestry of varied hues, and a gorgeous and resplendent rainbow encompassed its huge form, the reflection of which extended down into the clear and shining lake at its foot, making a perfect circle of the bright and fascinating arch above.

It was without question the most beautiful sight that I ever beheld, and the most indifferent person could not have viewed it without experiencing feelings of awe and reverence for such sublime and wonderful handiwork of nature, suggestive of thought which carries one's mind into an unfathomable realm, bounded by the unknown and the mysterious.

Although the salmon were not abundant on that bright and glorious summer's day, yet the scene to which I have referred made a deep impression upon me, and was the source of more real enjoyment than the best string of fish that I ever caught. And this suggests the idea oft repeated by summer pastime writers that the true angler is not confined to "fisherman's luck" for pleasure and happiness while on his solitary tours. If the fish persistently refuse his proffered artifices and do not recognize his earnest efforts in their behalf, he is ever patient and forbearing, and being a true and faithful worshiper at the shrine of nature, he is always surrounded by that which affords true pleasure, and is ever amid delightful and pleasant objects, ever in an elysium as perfect as can be known to any mortals. If he cannot continually catch the wary and delicate trout for food in his festal forest camp, he can every moment catch food for the best and most ennobling thoughts and gather inspiration from all about him.

J. F. SPRAGUE.

MONSON, Me., Dec. 31, 1883.

PHILADELPHIA NOTES.

IT was a great disappointment to those of our sportsmen who had planned woodcock-shooting trips for the opening day of the season to have had their sport ruined by the late rains. Previous to these storms there had been a lengthy dry period which concentrated many birds, drawing them to the comparatively few feeding grounds that remained. The storm that took place but a few days before the open season so thoroughly scattered the woodcock that but very few were found in places where they had been "spotted." The rain which also visited our section yesterday finished the work, so that we can safely consider July shooting will be of no account hereabouts. During June it was common to hear at the gun stores "I know where there are a dozen birds waiting for me when the season opens," or some such remark. These collected birds in almost every instance were not found, or at least in not such numbers as before the rains. The fall of water was a godsend to Mr. Longbill, for he finds feeding places now where he can be in a measure safe. Very many birds, however, were illegally shot in June. Of this I wrote you at the time.

Throughout our State the quail is everywhere whistling his nesting note, "Bob White," and there is a good prospect of a fair amount of birds for the fall, if the frequent rains do not drown the broods. The fact that the majority of the farmers begin to take an interest in the preservation of the quail during the winter is telling, and no doubt much of this is the result of a word spoken here and there by the sportsman himself, who now begins to find by paying a nominal sum to Mr. Rusticus he can have shooting secured for him. If our game laws and game protective societies do not take care of the birds, each sportsman can accomplish much with the farmer in the manner described. All that is needed is to interest him if need be in a pecuniary way, and a guardian is at once made. I once procured the finest of quail shooting on three or four adjoining farms in a very primitive section of Delaware by sending to each tenant for two successive seasons, blue Kersey army overcoats, which cost me but a trifle. I mention this as an illustration of what can be done, and would add every covey was saved for me, and I did not begin shooting until late in November.

The returning flight of bay birds from the North is looked for this year about the 1st of August. The birds generally show themselves from the 21st to the 25th of July, but this spring they were late in coming, and will be correspondingly tardy in appearing with their increase of family.

Nowadays on the New Jersey coast all the shooting had in the summer is at traveling birds, as they never stop longer than a tide to feed, and one requires to have a good blind and be able to whistle well or have a good whistler with him to have shooting at all. I am now speaking of points north of Atlantic City and south of Long Branch.

There is every appearance that we are going to have a good crop of reeds along our river flats this year. In times past this indicated corresponding good rail shooting, but of late years it scarcely pays one to be pushed over the grounds at either the Lazaretto or Chester, as but few rail are started, twenty to thirty being considered a good bag. At Port Penn or Morris River, however, rail are always numerous, but it takes such a big tide to give successful shooting. These freshets are not often hit when we want them.

PHILADELPHIA, July 5. HOMO.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—IX.

THE next morning it was agreed that I should fish alone that day, and work over to the sandbank in the afternoon, to bring Muller to camp in case he arrived.

The "calamity box" had been searched the evening before, and two immense hooks fished out of its depths, which old Ben "calculated were strong enough to yank the innards out of a thrashin' maskeen," and to each of these formidable-looking "innards agitators" a chain a foot and a half long was attached, made of No. 12 copper wire, also found in a recess of the calamity box. To each of these chains a hundred feet or more of trot line—a hard-twisted cotton cord a quarter of an inch in diameter—was securely fastened, and war was right there declared against the king maskalonge of Black Lake, or any of his tribe. With one of these persuaders the Deacon and one of the other boys took their way up lake to look after the big fellow off the mouth of Rock Creek, while I with the other one and a little white boat started straight for Pickerel Reef, where Dan and I had seen the chief of the tribe the day before.

At the shore end of the reef I took four or five pickerel, and selecting the smallest one of these—a three-pounder—the big hook was passed through both jaws, and he was returned to his native element alive, to be towed fifty or sixty feet astern, a tempting morsel for the monarch of Black Lake. The other end of the line was tied to the painter of the boat and passed over the thwart, where eight or ten yards of it were coiled within reach of my foot in the bottom of the boat, ready to play out the instant the strike was felt.

If that big maskalonge happened to be in that vicinity hunting around for a little morning diversion, all he had to do was to swallow that pickerel and the excitement would begin at once without any preliminary flourishes.

I had studied the points of the prospective battle all over carefully beforehand, and was prepared to come out on top or go to the bottom.

The loaded rifle was laid in easy reach, at half cock, and I had figured it out that if he had got the big hook tangled up in his corporation we would have it nip and tuck over the lake, for five or six hours, or until he was tuckered out, when I would pull warily up to him, snatch up the rifle and send a ball through his head. This, I flattered myself, would be a move he would not be looking for, and I had my chuckle over it in advance, like the Irishman who was going to have "a bit av sphort wid the bull in the pashtur forninst."

It was a brilliant (?) conception, and it looks even better on paper, as I write it, than it did there on the lake; and I may say it would perhaps have been carried out had not the contingency of Burns's line, "The best laid schemes o' mice," etc., wrecked the whole plan of the campaign.

I rowed all around the reef for a mile and for three hours, but the big fish had either changed his quarters or was too smart to be fooled with a common pickerel towing at the end of a quarter-inch cord, and I went back to the reef and plastered up my wounded smartness by yanking out a dozen of the snaky villains that claimed kinship with my bait.

But it was another backset.

The discomfiture of the Irishman when the bull tossed him over the pasture fence wasn't a circumstance to my disappointment in not running across the track of the great maskalonge, and his remark when he picked himself up that "it was a foine thing he had his laugh first," seemed to just about fit my case.

The wind had been rising for the last half hour and was now blowing a topsail breeze from the direction of Lake Huron, causing the little boat to pitch up and down in a way that made it hard to hold her anywhere and fish, and in half an hour more nearly the whole face of the lake was covered with white caps, and the waves were running so high that fishing was out of the question. I reeled up and pulled across the lake to the sandbank, and taking the rifle, went out to the forks of the road to wait for brother Muller. I found the "totem" shriveled and sun-dried so hard that they might have served for "pickerel clubs" to knock their brethren on the head with, but otherwise undisturbed. I listened for the sound of a wagon, but hearing nothing save the whistling wind, I strolled down the road a half mile, and turning off to the right, made a wide circuit through the aspens and patches of low bushes and huckleberries scattered over the plains, and back to the forks of the road again—just in the humor after the morning's experience to fight anything, from a chipmunk up to a 600-pound bear, and I have no doubt that, had a deer jumped up within range, I would have taken a shot at it out of a spirit of pure cussedness. Nothing had, however, appeared in sight on which to vent my spleen, and I stretched out in the shade of a young pine and studied over various schemes to capture the big fish until nearly 3 o'clock in the afternoon, when, concluding that Muller had given up the trip, I went back to the boat and pulled along under the lee of the shore where the water was quiet to the mouth of the little stream near the Hughes camp.

And, lest some readers who always want to know everything that happens may think it has been a long time between drinks, I will record it here that I got out and took a long drink of "clear, cold, sparkling, spring water," and before stepping back into the boat the draught was repeated.

All along this shore for nearly a half mile out the water was comparatively smooth, it being protected from the force of the wind by the woods and hill just back, but outside of this line the whole lake was a sheet of foamy white caps and tumbling waves rolling four and five feet high. From this point the wind blew nearly straight across to our camp. Hooking a dead pickerel onto the big hook I let out the whole length of the trout line and was soon plunging along through the foam at a pace that would have loosened the eye teeth of any maskalonge in the lake had he closed his jaws over that pickerel and the big hook.

The little boat sat low in the water, but she behaved well in the rough seas and I was having a glorious ride, when, happening to glance in the direction of the sandbank I saw a wreath of blue smoke outlined against the hill, and I knew six feet of the Kingfisher club was there wondering how he was to get "across the stormy water," and it did not take long to make it out that he had come just at the wrong time. It would not do to leave him there over night without shel-

ter, to be devoured by skeeters and "croppies," and the only thing to do was to 'bout ship and go after him, and this meant a hard pull of at least five miles, for I was not more than a mile from our camp when I saw the smoke signal. The dead longsnout was pulled in and the boat headed a couple of points above the sandbank to allow for leeway, but after a half hour's pull against the heavy sea and fierce wind that was now on the starboard bow, I was almost ready to give up in despair, as the boat rolled and pitched so badly that it seemed I had not made a rod of progress. But I considered that were I in Muller's place I would not like to be left there over night, and I buckled to the oars again with renewed energy, and at the end of what seemed another hour was abreast of a charred tree that Dan and I had selected as one of our landmarks by which to find a pickerel reef, and this was fully half way to the bank.

The gale had long since driven the other boys into camp, and they were now, as they told us in the evening, anxiously scanning, through the Scribe's marine glass, every visible part of the lake for signs of "Old Hickory." They had seen the smoke, and by aid of the glass could see Muller moving around on the beach, but had failed to get sight of the little white boat, although I was nearly in line with them and the bank, and could see the camp every time I was on top of a wave. They were really alarmed for my safety, but Old Knots comforted them with the remark that "the old sardine is probably asleep somewhere in the 'bresh,'" and Dan said, "It may be he's around in Sturgeon Bay waiting for the wind to go down. He'll turn up all right yet."

When I got into smooth water Old Ben, who was looking through the glass, relieved the anxiety with, "Hooray, boys! there's the old cuss now in that durned white pinted thing, jest a humpin' fur shore like a yaller dog with a tin can to his tail;" and they raised a shout that would have made me feel less tired perhaps could I have heard it. All this was told around the camp-fire that evening after pipes were lighted; and sitting here now, writing this a matter of 500 miles from Black Lake, I take the occasion to thank the boys all for their good will and solicitude for the writer's well being on that not soon to be forgotten day.

Nor must I forget that excellent boy, Sid Merrill, who had soon after discovering the signal, started from camp in a boat on the same errand, and when I reached the beach, "clean bushed," as Jim would have said, and sweating at every pore, he was less than a mile out, pulling a sturdy stroke, as regular as the pulsations of an engine. Had he known I was making for the same point, the trip would not have been undertaken, but the color of my boat was so near that of the foam-covered lake that no one, not even Muller, had made it out until I was in smooth water. He came ashore and we had a good rest before starting back, and as the wind and sea went down as evening drew on, the pull to camp was vastly easier, and brother Muller kindly furnished the motive power for the white boat going back. He had been detained a day on the road by washouts caused by the heavy rains throughout the middle portion of the State, and coming out from Cheboygan they had lost over an hour by an accident to the wagon; hence his late coming. The teamster had left him and his traps at the beach and started back for town, but not before he had pointed out some large bear tracks in the edge of the water, which he assured him, judging by the roily water in them, were not more than ten or fifteen minutes old.

This was not very consolin'; in fact, it was rather calculated to make the average "city feller" feel slightly "tore up in his mind;" but Muller is big enough to whip an average bear in a square fight, "bitin' and gougin' barred," besides, he had his breechloading rifle with him, and he felt that he could introduce himself to Mister B. Ruin in a creditable manner should he take a notion to return to the plains by the same road he came. He admitted to us, however, that the possible return that way of Mr. B. R. before he had time to frame a few remarks for the meeting, had raised a faint ripple on the usually quiet channel of his thoughts, and the moment the teamster was out of sight over the brow of the hill (brother M. is not given to undue precipitation) he unlocked his gripsack and taking out a handful of cartridges, slipped one into the rifle and would have stuffed in a half peck had it been that kind of a gun. Then he paced valiantly up and down the beach right where that bear had passed along, looking every minute for—a boat to appear in sight to take him across to camp.

That evening the smoke of the camp-fire was badly mixed with fish lies and bear stories, not a few of which would have disputed first place with neighbor Merrill's ablest effort in this branch of camp oratory, and it was not until everybody had "run down" that the circle broke up and we went to bed the happiest camp in the North Woods.

KINGFISHER.

[TO BE CONTINUED.]

THE CANADIAN SEA TROUT.

Editor Forest and Stream:

Your issue of June 26 has an article with the above title from "S. C. C.," in which he opens the question of the identity of this fish with the brook trout, and regrets that some one does not settle it. I do not know who he would accept as authority on this subject since he appears to reject all those who have declared the two to be identical. Whom shall we look to for a settlement of the question? Certainly not men who are anglers merely, and who decide by the presence or absence of spots. For myself, I consider the question settled long ago, and that the so-called sea trout is merely a sea-run brook trout.

Let us see who says they are not: Scott, Hallock, Roosevelt and other angling writers. On the contrary is the following list of authorities who are all more or less of ichthyologists, and some of them the first in the world: Gill, Bean, Jordan, Mather, Norris. If "S. C. C." is still in doubt on this question he can make inquiries regarding the standing of the two classes of authorities and decide which of the two he will accept.

The fact is that the case is settled, only some anglers do not seem inclined to accept the settlement. There is no doubt whatever about an angler being able to distinguish a "sea trout" from one that has strayed in the river. The signs are plain enough, just as you can distinguish a book-keeper who has had a vacation in the woods from one who has not, by his browned skin, but he is a book-keeper all the same.

The South Side Club, of Long Island, has obtained eggs from the so-called sea trout, and the young cannot be told from ordinary brook trout. If they are distinct then they should breed true to kind. Let us accept the authority of the trained scientists, who all agree, and smoke the pipe of peace over the trout question. POKE-O-MOONSHINE.

MAINE FISHING.

THE Maine Fish Commissioners have just completed their work of distributing 1,400,000 salmon fry to the different waters of that State, in the order previously announced in the FOREST AND STREAM. They finished by placing 50,000 landlocked salmon in the upper Androscoggin waters. One of them says: "We hope to continue as good a quota yearly until the waters are fully stocked. The most marked feature to me this year was the wonderful fecundity of those waters in trout and the fish food adapted to feed the trout family—no bass, either black or white; no perch; no bream; no eels; no catfish—all the enemies of the *Salmonidæ*, or at least not fit for their food. But the waters are literally crowded with *Cyprinidæ* of all sizes, the natural food of the trout."

Of course the Commissioners went a fishing at the Androscoggin Lakes, and they remark: "We do not believe that there is scarcely a single day in the whole season when an ordinary angler who gave the fish a fair trial could fail to take trout enough for his daily consumption. On the shallows we invariably found an abundance of trout of from one-half to one pound, and even up to two pounds weight, rising readily to the fly. In deeper water, trolling with the minnow, larger fish were taken; but we took none of over four pounds. We are satisfied that the better protection which the increased appropriation of the State has afforded us the means of giving is entitled to the credit for this great increase in trout during the past few years."

To this sentiment should be added that it is only the faithful, earnest work of the Commissioners, which has expended the limited means put in their hands by the State in a manner designed to be of so great and lasting value to the public. SPECIAL.

BOSTON, Mass., July 7.

HOW DELAWARE RIVER FISH ARE DESTROYED.—There was a time when the Delaware River abounded with valuable food fishes from its junction with Delaware Bay to its source in the State of New York. It was once noted for the number, size, and excellence of its shad, perch, rock fish, sturgeon, and other varities of fish suitable for human consumption. If a like abundance now prevailed, instead of paying from fifteen to twenty cents per pound for fresh fish, we would have them direct from that stream at less than half those rates. While the pollution of the waters of this fine river by gas works, coal oil refineries, etc., has had much to do with the marked decline in its fish products, there have been for years and are to-day still more potent and harmful agencies in the form of fish baskets, nets, weirs, etc., in the localities where the shad usually spawn, and where their young are hatched into life. Only those familiar with the injury wrought to the shad-fishing interests of the Delaware by these illicit devices can form a proper conception of its extent. There is good authority for the statement that in a single season as many young shad are destroyed by almost any one of the many well-constructed fish baskets in the upper Delaware as are anuually caught full grown at all the fisheries on the river. Extravagant as such an estimate may appear it is sustained by facts. A member of the Board of Fish Commissioners informed the writer a few years ago that young shad taken and drowned in one of the largest of those fish baskets had been hauled away by the wagon load and used as fertilizers for the adjacent fields. Formerly these fish baskets were constructed with wings of stone, but wire netting, which is much more easily put in position or removed upon intimation of an official raid, is now used, and with more damaging results to the fish. Dynamite and giant powder cartridges are also used in many streams, especially the smaller ones, such as the Pennypack, with equally disastrous effects, as the explosions kill alike the large and the small fish. At other places cocculus indicus, quicklime, and other stupefying and life destroying substances are employed.—*Philadelphia Ledger.*

TENNESSEE.—Savannah, June 30.—The bass season is open here all the year round, but unfortunately the greater number are caught in April or May. The catch this year is reported as above the average in point of numbers, but the size is small. One small-mouth bass four and a quarter pounds and another of three pounds are the largest I have heard of. The Klaw Hammer Angling Association returned from its annual meeting at the Sulphur Spring camp grounds on Horse Creek last week. Business prevented my accompanying the club. They report everything right except the fish, which failed to do their part toward the general good time. However, they caught enough to keep the frying pan at work and all returned in good spirits. We expect to make another expedition early next month, and if we do, I will keep you informed of the result. The fishermen are taking quantities of drum and small catfish on trot lines in the river. The river is too muddy for bass fishing at present, although two or three weeks ago a party visited the island some four miles above town and took several fine bass and a great many large bream and sunfish, fishing on the bar at the head of the island.—WILL.

PRINCE EDWARD ISLAND.—Charlottetown, July 1.—Trout fishing is good in most of the streams here at the present date. The fish are numerous and of good size, and go for most any kind of a fly viciously, and are full of fight when hooked. Another thing which adds greatly to the enjoyment of the sport is that there are no mosquitoes and "no-see-ems" here. The largest *S. fontinalis* taken here was killed in the Morrelle and weighed four and a half pounds, and four of his mates were taken at the same time that weighed four pounds each. In the Guerney River a half-pound trout at one dash scooped up two of my flies, and when landed had them both well down his gullet.—STANSTEAD.

THE WEST ISLAND CLUB.—Some fine striped bass were taken last week by members of the West Island Club. I met one of the club on the train who told me that Messrs. Isaac Townsend, R. L. Cutting, Chas. L. Tiffany, Chas. E. Miller and S. W. Milbank, of New York, and Mr. W. Sellers, of Philadelphia, were down at the club and were having good success. They took six large fish on Monday last, which was the first good day of the season. The largest fish taken this year weighed thirty-two pounds.—POKE-O-MOONSHINE.

BASS GROUNDS IN VERMONT.—Small-mouthed black bass are reported to reward the angler who casts his flies in Lake Champlain, near St. Albans, Vt. Accommodations and boats can be found at the Lake View House, a notice of which is given in our advertising columns.

DEAD FISH IN LAKE ONTARIO.—This dispatch was sent from Ottawa yesterday: "The Marine and Fisheries Department has come to the conclusion that the millions of dead fish now floating on Lake Ontario are young shad hatched at Seth Green's fish-breeding establishment at Rochester, N. Y., and placed in the streams tributary to the lake. It is also believed that the falling off in the catch of whitefish in Lake Ontario is due to the poisoning of the waters by the dead shad. Representations will probably be made to the United States Government respecting the matter." "That's a very singular dispatch," said Mr. Eugene. G. Blackford, "and I am convinced that there is an error somewhere. Mr. Green has not hatched any shad at his breeding establishment in Caledonia, not far from Rochester. He hatches nothing there but whitefish, salmon and brook trout. The shad which he hatched at Castleton, near Catskill Landing, were all turned into the Hudson River. The only shad hatched by the New York Fish Commission beside these were 80,000 at Cold Spring, Long Island, which were turned into the Smithton River. I think the Canadian Fisheries Department are mistaken about the fish. I should not be surprised if they were fresh-water herring, which are indigenous to the great lakes, and somewhat resemble young shad." [The above appeared in the New York *Times* of July 8, and the annual appearance of dead fish in Lake Ontario, supposed to be shad, has been yearly noticed in our columns. Three years ago Dr. Bean pronounced the fish to be alewives, and we do not doubt that those of the present year are the same fish. Just why the papers should blame Mr. Green for introducing these or any other fish into the lake we do not see. He is merely a superintendent, and is, or should be, under the orders of the State Fish Commissioners, who alone are responsible for all plantings of fish, as well as for the acts of their subordinates. The hatchery near Rochester belongs to the New York Fish Commission, a fact that does not seem generally known.]

SHEEPSHEAD AND WEAFISH.—Philadelphia, Pa., July 5.—Our rivers still continue to be very muddy, this condition having been increased by a second deluge of rain yesterday. There is no earthly use trying for bass within twenty miles of Philadelphia while the water is in this state and I fear it will take some days before it is clear. Sheepshead are biting well at both Barnegat Inlet and Little Egg Harbor Inlet. Weakfish and seabass are plentiful at these points, in fact one can always, at this season, be assured of sport at both places. No bluefish have thus far shown themselves at either Barnegat or Little Egg Harbor. Outside the beach scores of menhaden fishing steamers are plying their trade.—HOMO.

MAINE WATERS.—Anglers' Retreat, Middle Dam, June 30.—June has been a splendid fishing month here, and last week Mr. G. H. Wellman, of Lowell, Mass., who was stopping here, had some very nice fly-fishing, taking one three-pounder and one of five pounds, besides numerous others of lighter weight. As the gates at the Middle Dam are now closed, and will remain so for several weeks, there will be good fishing on the river, at the head and foot of the pond, Smooth Ledge, the Hop Yard, Cedar Stump, and other places where the trout congregate when the water in the river is low. Now is the time for anglers who would like to make a mid-summer trip to visit this place.—L. L. S.

BASS IN THE POTOMAC.—Moorefield, W. Va., July 7.—Continued rains and high waters have prevented bass fishing up to this time, but the prospect ahead of us (owing to the unusual numbers of fish brought up by high waters in the spring and the clearing of the streams of all moss and brush by late freshets) is unusually fine. No finer waters can be found for black bass fishing than the water of the south branch of the Potomac at this place, either for fishing from shore, wading or from boat, with fly or live bait. Daily stages and livery connect from Keyser, on B. & O. R. R.—COMMODORE.

FARIBAULT, Minn.—I would inform sportsmen, who contemplate a trip this summmer to the Northwest, that the fishing in the lakes of this State has been and is now unusually good; some very fine large catches have been made.—R. E. S.

SPANISH MACKEREL and sheepshead were taken last week for the first time this season off Bayshore, L. I. They have hitherto been caught no further north thon the southern New Jersey coast.

Fishculture.

AMERICAN FISHCULTURAL ASSOCIATION.

Proceedings of the Thirteenth Annual Meeting.

IN the evening at 8 o'clock an address was delivered by Hon. Theodore Lyman, of Massachusetts. Hon. Elbridge G. Lapham occupied the chair. The hall was well filled by an appreciative audience, of which about one-fourth were ladies. The chairman, in introducing the orator of the evening, spoke as follows:

"LADIES AND GENTLEMEN: I am thankful for the honor of having been selected to preside over the ceremonies of this evening. The subject which has called us together is one of far greater importance than the mass of the public conceive it to be. The question of the propagation and preservation of the food fishes of our streams and along the ocean coasts is second only in importance to the propagation and preservation of animal food. Indeed, the food which is furnished by the fish of our waters is free from many of the difficulties and dangers connected with the subject of animal food. We have in the former no trachinæ, pleuro-pneumonia, foot-rot or mouth disease. Fish are not controlled in their habits by man as animals are. The demand for fish as an article of food has of late years been rapidly increasing. Indeed such demand far exceeds the supply, and every year the interest taken in the subject is increasing, and this is the case not only in this country but in almost every civilized country of the earth. This subject has of late attracted special attention through the international exhibitions held at Berlin in 1880 and at London last year, where I am proud to say the United States bore off the honors for having the best and largest variety and most perfect exhibits which were made. It is a subject, I repeat, of vast and deep importance to everybody. A little more than two years ago the State of New Jersey undertook the passage of a law to regulate the fisheries in the waters of the ocean, over which she supposed she had control. The Attorney General, however, decided that the State had no jurisdiction over the subject beyond low-water mark on the ocean coast. A bill was introduced by Hon. Mr. Sewell, of New Jersey, looking to the passage of a national law regulating this subject. This was referred to the Committee on Foreign Relations, to consider whether such a law would inter-

fere with our treaty obligations under the Treaty of Washington. For two seasons a sub-committee of that committee has been investigating the subject, and has visited many of the principal points along the ocean coast from Fortress Monroe, Virginia, to Portland, Maine. A volume of valuable testimony has been gathered on the subject, and I confess that I had no conception of the importance of this question until I entered upon that investigation. It is almost as fathomless as the ocean itself. We have met this evening to consider this grave and important subject, and I now take great pleasure in introducing to you the Hon. Theodore Lyman, of Massachusetts, who will deliver the annual address of the Association."

SPEECH OF HON. THEODORE LYMAN.

Old Rondelet wrote a great work at the beginning of the sixteenth century on sea fishes. His breadth of view included under the term "Fishes" almost every living thing that he found in salt water. It is in relation not to a fish but to the radiated Medusa-head that he uses these fine words, more familiar, perhaps, to our older naturalists than to those of the rising generation: *Immensa et summe admirabilis poi potentia atque solertia in rebus cœlestibus iisque quæ in aere et terra fiunt, maxime vero in mari, in quo tam variæ et stupendæ rerum formæ conspiciuntur ut quærendi et contemplandi nullus usquam futurus sit finis*—"Vast and highly admirable are the power and skill of God in things heavenly and earthly and in those of the air, but more especially in the sea, where are beheld shapes so various and stupendous that the study and contemplation of them shall never end."

He spoke thus in the spirit of prophecy. Three centuries have passed and we are still contemplating and investigating the things of the sea. We have skimmed its surface with muslin nets in search of its infusoria, and we have let down dredges and scraped its valleys three miles deep, and still the shapes various and stupendous continue to multiply. The more workers there are, the more work remains to be done. Humble clams, worms and urchins take on great importance and become marine Sphinxes, asking riddles that no one can answer. Creatures that once were conveniently dismissed as gelatinous, or gristly, now advance claims to an intricate circulatory system, to muscular fibres and to nervous ganglia. Nay, they proudly look down on the vertebrates, in the matter of reproduction, as they pass gracefully through the varied stages of alternate generation and self-division.

Rondelet lived near a sea whose inhabitants were well calculated to excite his wonder and delight. He was professor of medicine at Montpellier, not many miles from Aigues-Mortes, the port whence St. Louis embarked for his crusade, and whose walls, now surrounded by dry land, were in the middle of the sixteenth century still bathed by the waters of the Mediterranean. The shallows of the bay teemed with the smaller crustacea and shells, while the open sea beyond was then, as now, the home of many fishes, varied in form and brilliant in color—the whiting, the red mullet, and the tunny celebrated by classic writers. There, too, were found the darting squids and the great-eyed octopus, while from its depths came the rosy coral.

In the ancient medical school of Montepellier, still hangs the portrait of Rondelet in his red gown. He has a placid look of a man who was master of his studies, and who stood well with science and with the church. For had he not as a patron, Bishop Pelicier? and was he not the first authority in zoology and medicine, at a time when a good scholar could acquire all that was known of these and many things besides?

Every gain in knowledge has a loss that balances it. As the current of human thought grows wider, it becomes also more shallow, and splits into that infinitude of little channels which now are called specialties. In each of these channels may be seen a diligent investigator urging forward his little skiff, and well contented to be navigating what to him seems the great river of truth.

Learning has grown so great in our day, that the genius of one man can grasp no more than a part of it; so that in proportion as learning becomes larger, generalization, which is the final end of learning, grows more difficult. Worse than this, the mind employed on particular investigations gets unsymmetrical. The side that is used is strengthened; the disused side fails, and there results a scholar who believes in one set of ideas only.

After all then, we must look with a certain envy at the state of mind of old Rondelet. Like most men of his age, he had that richness of thought and expression which comes of many-sided culture, and a strong faith in things both material and immaterial. When he said "Dei potentia," he distinctly meant power of God, and not "potentialities" or "molecular environment" or "power that works for righteousness," or any of those modern euphuisms which taste in the mouth like weak boiled arrow-root. Nevertheless, if we look closely, we can find the beginnings of that skepticism which plays so great a part in one day. For both he and his bishop Pelicier were strongly suspected of favoring the Reformation. As to his colleague, Rabelais, he was noted for his unorthodox opinions, and went so far as to describe the future life as a "great perhaps."

But it is high time to leave Rondelet, and turn our attention to his sea-fishes. Their importance was great then; it is greater now. We might know by analogy, did we not know by actual research, that fishes have ever been of the first importance for men's food. Their natural abundance and the easy capture of shallow species put them within the reach of the primitive savage. The skeleton of the pre-historic chief, found in the cave of Mentone, had a head ornament, a net strung with Trochus shells, showing that he had walked the beaches of the neighboring Mediterranean, whose waters doubtless furnished his food.

The shell heaps of Scandinavia and of America, contain abundant bones of fish. Morton, of Merry Mount (1623), gives us a good idea how these shell heaps were formed, when he tells how the Indians came each year to the shore near Quincy, in Massachusetts, and there camped for a long time, feasting on the plentiful clams and lobsters, and alewives and striped bass, whose shells and bones combined with the camp offal to build those deposits that we call shell heaps.

In New England it must have been the fish that furnished the surest support to the native savages. Even in the depths of its Arctic winter there was a chance to get eels, smelts and clams, and at the first approach of mild weather the waters teemed with abundance. "It (Pawtucket Falls) is excellently accommodated with a fishing place," wrote good Mr. Gookin in 1674, "and there is taken a variety of fish in their seasons, such as salmon, shad, lamprey eels, sturgeon, bass, and divers others. And this place being an ancient and capital seat of the Indians, they came to fish; and this good man (Mr. Eliot) takes this opportunity to spread the net of the Gospel to fish for their souls."

That child of Belial, Morton, of Merry Mount, as keen a sportsman as any of our Bohemian backwoodsman, gives enthusiastic accounts of the abundance and excellence of the fish which were in the sea convenient to his house. He is the first author that mentions cod-liver oil, which now plays so beneficent, though nauseous, a part in medicine.

He writes: "The coast aboundeth with such multitude of codd that the inhabitants of New England doe dunge their grounds with codd, and it is a commodity better than the golden mines of the Spanish Indes. * * * Greate store of traine oyle is mayd of the livers of the codd and is a commodity that without question will enrich the inhabitants of New England quickly."

Almost coincident with the establishment of Plymouth colony, we find laws concerning the fisheries, proof positive of the esteem in which they were held.

In 1633 was passed what I take to be the first law for the encouragement of fishculture, in these words: "It is enacted by the Court * * * but if any man desire to improve a place and stocke it with fish of any kind for his private use, it shal bee lawfull for the Court to make any such graunt and for bid all others to make use of it."

In 1637 the same court enacted, with the contrary-mindedness of our Puritan forefathers, that six score and twelve fishes shall be accounted to the hundred of all sorts of fishes.

In 1670, it was set forth with pious teleology that "the providence of God hath made Cape Cod commodious for us, for fishing with seines;" implying that it might not be commodious for less religious persons. The act goes on to state that "careless persons" must not interfere with the said providence, "by leaving the garbage of fish to lie there."

The country had not been settled a half century before there was complaint of the diminution of fish. The act just quoted goes on to speak of the great inconvenience of taking mackerel at unseasonable times, whereby their increase is greatly diminished, and a law was passed prohibiting the catching of fish before they have "spaumed." This shows that our ancestors were not more logical than most of their descendants, who still hold, that to take a fish when ripe for spawning is in some peculiar way destructive to the species. It is almost needless to say that fishes taken at any time of year are killed before they have "spaumed." The only reason that it is more destructive to take fish during the spawning season is because they are then tamer and are crowded together, so that greater numbers are likely to be captured.

The river fisheries, too, called aloud for protection. In 1709, it was enacted "That no weirs, hedges, fish garths, stakes, kiddles or other disturbance or encumbrance shall be set, erected or made on or across any river, to the stopping, obstructing or straitning of the natural or usual course and passage of fish in their seasons * * * without allowance first had and obtained from the General Sessions of the Peace in the same country." This law, especially applied to such fishes as run up the rivers to spawn, salmon, shad and alewives. The Indians, in their day, were wont to construct weirs and the like obstructions to capture these fishes. But the Indians were few and were idle and wandering. They took only what was necessary for their present use. Now, however, had come the white men, who put up permanent abodes and increased in numbers, year by year. They were money makers, who worked every day and all the day. They would catch fish, not for themselves only, but to sell to strangers; and so they have gone on ever since. Patucket Falls, on the Merrimac, where the Apostle Eliot spread his net of the gospel, now furnishes the water power for the great manufacturing city of Lowell. And Merry Mount, to-day the country seat of John Quincy Adams, is a suburb of the metropolis of New England. The inhabitants no longer "dunge their grounds with codd" but are fain to buy that fish in the market at a round price per pound.

The river fish whose protection has cost most law-making in the old commonwealth of Massachusetts is the humble alewife. In contradiction of the proverb "mute as a fish" this one may truly be said to have made a great deal of noise in the world. Like some men they are small and humble, but persistent and numerous. In the spring time the alewives stand in from the sea, and push up the smaller fresh-water streams, seeking ponds wherein to deposit their spawn. They come in great armies and insist on entering those ponds. Nothing less than a vertical wall six feet high will stop them. Amid the clatter of mill wheels, and in the very face of the sweeping scoop net, they force themselves through rapids, over falls, and by long underground drains, regardless of their perishing comrades, who by thousands fall a prey to the fishermen and to hawks and eagles; or who run themselves ashore in their frantic efforts to get on. It may be that only a few reach the spawning ground, and these are enough to keep up the race; for one female will lay a quarter of million of spawn. They are therefore *par excellence* domestic and cultivable fish and have been so regarded in Massachusetts for generations. As early as 1741 there was passed "an act made to prevent the destruction of the fish called alewives," wherein it was provided that any owner of a dam "shall make a sufficient passageway for the fish to pass up such river or stream, through or around such dam."

It is, however, not until 1790 that the alewife fishery of Taunton Great River, first appears on the statute books, whose pages it was destined to encumber. If very few of my hearers know anything of Taunton Great River, the fact proves how miserably our system of popular education fails to instruct people concerning the most remarkable geographical features of the land. Taunton Great River was doubtless named in the spirit of contrary-mindedness already referred to as a characteristic in our Puritan ancestors. The unregenerate would be inclined to call it Taunton Small River, for it is a small stream, which heads in some ponds in the town of Lakeville, and after a short and quiet course empties into the sea at Fall River. But not the mighty Mississippi itself bears on its bosom so great a mass of legislation. The great and general Court of Massachusetts invariably spends a portion of each session in trying to regulate the fisheries of this stream. The fishermen of the upper waters always complain that those of the lower waters get all the alewives, while those of the lower waters maintain that their rivals feloniously conspire to shut the fish off from their spawning grounds. And when by some special providence, both sets of fishermen are at peace with one another, they invariably make a combined attack upon the regulations of the State Fish Commissioners. The riparian inhabitants of other alewife streams, although not so combative, are quite as much interested as those of Taunton Great River. Indeed it was in such waters that a sort of fishculture first grew up. In some cases where a dam owner wished to save his water power by shutting up his fishway, he would agree to catch each year so many thousand alewives at the foot of the dam and to convey them alive to the millpond above, and thus to keep up the crop. And it has been the custom for more than a century to regulate these little streams by special acts which govern the public sale of the fish, the days on which they may be netted and the fishways that are to be kept open for their passage. The law goes often so far into detail as to provide that each widow of the town shall have a barrel full for nothing. I have dwelt thus long on this humble fish because its successful culture gives encouragement to attempt that of others more difficult.

I shall follow briefly the decline of the fisheries in New England, because it is there that an organized system of fishculture first in this country took its origin. That region has two rivers of considerable size—the Connecticut and the Merrimac. Both rise in the cold streams of the White Mountains. The Connecticut, flowing south, empties into Long Island Sound, and the Merrimac, by a southeasterly course, reaches the Atlantic Ocean. A century ago both rivers abounded in shad, salmon and alewives, and would doubtless have continued for many years to give a fair yield, in spite of over fishing, had it not been for the erection of impassable dams, which were intended to give water power to the manufacturers, or to furnish slack water navigation to lumber rafts. As early as 1798 the Connecticut River was thus barred at a point just within the northern limit of Massachusetts, but it was not until 1847 that the Merrimac was in like manner shut off by the great dam at Lawrence. In both cases the salmon, stopped on their passage to the spawning grounds, became extinct after a few years, while the shad and alewives, which could be bred in the lower waters, continued annually to revisit these rivers.

What happened on the Merrimac and Connecticut happened equally on almost every lesser stream in that region. The people of New England, lacking advantages for farming, turned all their attention to manufacturing. Water power was then much cheaper than steam, so that before long there rose a dam wherever there was a fall great enough to turn a millwheel. Except some simple trenches for the passage of alewives, no fishways were then known. The complete ignorance of this subject may be illustrated by the great dam twenty-seven feet high at Lawrence. The charter of the company permitted the building of a dam, provided a pass were furnished for salmon, which should be satisfactory to the County Commissioners. Before the dam was finished a solemn council of the best ichthyological and engineering talent was held to determine what kind of pass would be suitable. The council based its judgment apparently on the cheap woodcut in the primary geographies of half a century ago, which represented a salmon briskly leaping over falls at least fifty feet high. At any rate, the salmon pass finally approved by the learned Commissioners consisted of a simple plank trough, sloping from the crest to the foot of the dam, at an angle somewhat steeper than forty-five degrees. It is needless to say that the salmon declined to exhibit any of the feats of agility portrayed in the woodcut of the primary geography.

There soon came to be a general feeling, and one under the circumstances quite natural, that manufactures and fish mutually excluded each other, and so things were allowed to drift at their pleasure. The streams that emptied into salt water no longer furnished such abundant swarms of small fry as had in former days served to toll the sea fishes toward the land, while the passage of boats and steamers and the increase of population and of fishing tended to destroy or scare away the fish of the small bays and coves. The balance of nature had thus been changed, and one part had reacted against another.

The steady dimunition would have gone uninterruptedly on but for the revival of fishculture.

The discovery of artificial impregnation of eggs is such a simple one that the only wonder is that it was not practiced long ago. Country boys who watch the brooks in autumn, know how trout deposit their eggs; and fishermen, after hauling their seine ashore, are familiar with the spectacle of spawn and milt flowing from the ripe fishes. It is more than likely that many persons have in the past times practiced the artificial fecundation of ova. The process was described in 1420 by Dom Pinchon, a monk of the abbey of Réome. It was rediscovered by Jacobi, of Westphalia, in 1763, and several naturalists availed themselves of this method in their embryological researches. Among others, Louis Agassiz, who, in 1838, hatched the impregnated eggs of Swiss whitefish by tying them in a muslin bag and sinking it on the margin of the lake of Neufchatel.

In 1843, two fishermen of the Vosges, Joseph Rémy and Antoine Géhin, not only hatched a large number of trout, but devised means of feeding them artificially. They succeeded in stocking several water courses in their neighborhood with these trout fry. Seven years later their results had become known to the scientific men in Paris. Napoleon the Third had already begun his elaborate measures for the material aggrandizement of France and he took up fishculture and the acclimatization of new animals among other schemes. He disliked the professors of the Garden of Plants because of their Orleanist sentiments, and he set up a rival under the name of the Garden of Acclimatization, of which fishculture was in some sort a branch. Its apostle was Professor Coste. With large appropriations from the central government he established at Huningue, near the Swiss frontier, a large and elaborate station for fishculture. His enthusiasm was great. He estimated that the yield of fresh-water fishes in France was not worth more than $1,200,000 annually, which he was confident could be raised by artificial fecundation to $180,000,000. Like many another inventor, Prof. Coste was doomed to opposition and disappointment. M. Rimbaud, Secretary of the Fishery Board of Marseilles, ridiculed what he called the unnatural waterculture. He said the machinery and labor for hatching and the artificial food would cost more than the fish would come to. He was not far from right. With plenty of money to work with, it was not difficult to build hatcheries, dig ponds, set up apparatus, and put in turbine wheels for pumping. The working of the establishment was more difficult. The spawn, collected at distant points and sometimes in a careless way, often failed to hatch. The fry, carefully placed in suitable pools, disappeared in a way considered mysterious, until it was discovered that several large pickerel had found their way into the pools. The eminent engineers of the *ponts et chaussées* contended in vain with the waters of the Rhine, which sometimes backed up and flooded the pools and tanks, and anon receded, leaving the turbine wheels high and dry. Years rolled on, and Prof. Coste was still struggling to make fish plenty in France, when the Prussian armies crossed the Rhine and appropriated Huningue to the use of the German Empire.

All these disappointed hopes had not been quite in vain. Many valuale experiments had been tried and precious information published, and, above all, it had been discovered that certain things could not be done. Meanwhile, knowledge of these discoveries had crossed the Atlantic, and in 1853 Dr. Theodatus Garlick hatched the artificially impregnated eggs of trout. Three years later commissioners appointed by Massachusetts published a valuable report on the general subject of fishculture, and attempted unsuccessfully to hatch trout. In the same year an admirable report on fisheries was written by the eminent scholar, George P. Marsh, who had been appointed a Commissioner by the State of New Hampshire.

The true beginning of fishculture, however, under the auspices of State governments, was in July, 1864, when New Hampshire and Vermont passed legislative resolves calling on Massachusetts to re-establish a free passage for migratory sea fish through the dams on the Connecticut and Merrimac rivers. To the late Judge Henry A. Bellows, of New Hampshire, this country owes the successful beginning of the undertaking. He was an advocate learned in the law and full of enthusiasm for the restoration of the former runs of salmon and shad in the cool waters of the Pemigewasset and the broad expanse of Lake Winnipiseogee. He appeared before a committee of the Massachusetts Legislature, and by their recommendation two commissioners were appointed, of whom I had the honor to be one. This was in 1865. Within a year every New England State was represented by Fishery Commissioners. They were accustomed to assemble from time to time for the discussion of their mutual interests. These modest gatherings, whereat the assembled authorities failed not to test the excellence of their own fish, were the prototypes of the national gathering we celebrate this evening.

The opening of the great dams by fishways led to several important results. In the first place the decision in the case of the Massachusetts Commissioners against the Holyoke Water Power Company has settled the law in regard to the rights of migratory fishes in rivers. This decision, which was confirmed by the United States Supreme Court in 1872, sets forth that a river was a public way, and the passage of migratory fish in it a public right. Therefore, whoever builds a dam across a river must furnish a passage to its migratory fish unless expressly exempted by the Legislature.

It thus became easy to open the streams, and hundreds of owners of dams, who by adverse possession had considered themselves safe from intrusion, now found themselves obliged to construct fishways at their own expense.

The second important step was also a legal one. It was the passage in 1869, by Massachusetts, of an act to encourage the cultivation of useful fishes, which was intended to embody in one law all necessary regulations. Before that time the fishery laws of that State, to the number of nearly four hundred, were for the most part special enactments. The new statute substituted general provisions. It established a board of fishery commissioners, and gave them suitable power; gave to the riparian proprietor the control of ponds not exceeding twenty acres in extent, and regulated the times and methods of taking fish.

In attempting to restock the Merrimac and Connecticut, the most difficult problem possible was the one first encountered.

that of building a fishway which would carry salmon, shad and alewives over a vertical dam nearly thirty feet high. In this country we had nothing to go by save the salmon passes of Great Britain, or the little water-steps over the low continental dams. Through successive improvements we have now attained a fishway that will certainly carry salmon, alewives and the common river fishes over the most difficult dams. But the shad, with his love of the broad, gentle stream, and his suspicion of artificial contrivances, still remains rebellious. There is, however, a strong belief that the ingenious Colonel McDonald will irrisistibly inveigle the shad into his mysterious pass. It is indeed a truly Irish pass, in which more water runs in than runs out; and the steeper is the incline, the more rapidly the water runs up hill; so that a shad would think he was swimming toward Fortress Monroe when he was in reality going over the falls of the Potomac. From the outset, the Massachusetts Commissioners had foreseen that the building of fishways on the Merrimac River was but a half remedy. It was further necessary to breed salmon and place them in the upper waters, that they might thence descend to the ocean, and return as marketable fish to their native river. To obtain impregnated eggs of salmon was at the time a work of great difficulty and expense. In the autumn of 1866, Dr. W. W. Fletcher, of New Hampshire, placed 15,000 New Brunswick salmon eggs in the Pemigewasset; but it was not until 1872 that 16,000 young fry were let loose in its waters: and in 1873, 185,000. Occasional captures of salmon in nets at various points on Massachusetts Bay were soon after reported; and on the 31st of May, 1867, two full-grown salmon were discovered mounting the Lawrence fishway. Since that year, salmon have been artifically bred at the headwaters of the Merrimac, and the full-grown fish have annually ascended a river in which for twenty-five years they had been extinct.

The other chief river of New England, the Connecticut, was the scene of the first artificial hatching of the shad. With the encouragement of the Massachusetts Commissioners, Seth Green, of New York, began, in the summer of 1867, his experiments in shad hatching at Holyoke. His simple and ingenious invention of a hatching box, which kept up a constant current by floating, not horizontally but at an angle, has become a matter of familiar history. Great was the ridicule directed against Green, as he painfully waded about in the river under the hot June sun. But when, a few seasons later, the shad appeared in unusual numbers at the mouth of the river, ridicule was changed to admiration, and the great crop of that year was called "Green's shad."

In the following year, 1868, shad hatching was established on the Merrimac and daily record was kept of the temperature of the air and water, of the number and sex of the fish taken and the quantity of eggs hatched. These tables were the first of the kind published in this country.

The progress of this slight sketch has brought us to the question which underlies the subject of fishculture in its broadest sense, it is the question of the possible exhaustion of great fisheries, and especially those of the sea.

We have seen that soon after the first settlement of the country, complaints of the decrease of fish began to arise. It is very likely that those complaints came rather from the accidental differences of seasons than from any real decrease. Nevertheless, they indicate that the relation between overfishing and decrease of the crop was one that was early suggested to our people. The entire subject was brought into prominence in our own day by the report of the English Commissioners to inquire into the sea fisheries of the United Kingdom in 1864. Of these Commissioners it has been said: "Their industry was extraordinary, and the piles of evidence were such as to leave the impression that every fishwife in the three kingdoms had had her say. The trawlers were vehement against the set-hook men, and the set-hook men were furious against the trawlers. The Commission decided that they all were right, and might fish when, how and where they pleased. But just then Mr. Bertram comes out with his "Harvest of the Sea," in which by fact and figure he aims to show just the opposite, namely, that the open sea fish had decreasd by overfishing.

The question of the progressive exhaustion of sea fisheries came up six years later in America in the form of a monster petition presented to the Massachusetts Legislature, which was asked to pass a law restricting fishing with weirs, seines and gill nets. The petitioners alleged that valuable fishes, such as the scup, the tautog and the striped bass, were taken by the above mentioned contrivances in so wholesale a way as to threaten their speedy extinction. The complaints applied chiefly to the southern waters, including those of Narragansett Bay, where the inhabitants of Rhode Island were equally interested, and both States proceeded to investigate the subject. Their methods, however, were no better than had been those of the English Commissioners, and consisted chiefly in the examination of numerous witnesses. It was the same story over again. The weir men swore against the hook-and-line fishermen and the hook-and-line fishermen swore against the weir men. The moment had evidently arrived to abandon the methods of the court room and to take up those of scientific investigation.

To this end the Massachusetts Commissioners, in the spring of 1881, hired a weir at Waynoit, on the south side of Cape Cod, and put it in charge of an observer, who kept a daily record of the fishes taken, of the wind and weather, and of the temperature of air and water. At the end of the season the results were embodied in a report, entitled Third Notice upon the Possible Exhaustion of Sea Fisheries. It was shown by this investigation that the moment at which fishes leave the ocean to enter rivers is determined by the temperature of the water. It further appeared that these so-called anadromous fishes are usually caught in weirs and in similar traps when hurrying along the coast in their northward migrations, whereas those that arrive near or at the mouth of their native river slacken their pace and cautiously feel their way, like a ship standing into a harbor. These last are more apt to avoid the nets ingeniously set for their capture.

Up to this time the movement in favor of fishculture had been confined to New York and New England, and chiefly to the State of Massachusetts. Dams hitherto impassable had been opened to the passage of the anadromous fishes; fishways of an improved form had been built; a decision of the Supreme Court had given to fish the right of way in rivers; acts for the encouragement of the cultivation of useful fishes had been passed; the artificial hatching of shad and salmon had begun, and an investigation into the exhaustion of sea fisheries had been set on foot. All these measures, were, however, partial and on a small scale. The moment had arrived for the interposition of a power stronger and more general in its character.

That democratic and gregarious fish, the scup, was the founder of the United States Commission of Fish and Fisheries. It is a fish coeval with the first white settlements. In 1621, on the shores of Buzzard's Bay, the hungry Englishmen were entertained by Massasoit with "two fishes like bream, but twice as big and better meat," and Roger Williams says in 1642, "Nishcup the bream. Of this fish there is abundance, which the natives dry in the sun and smoke, and some Englishmen begin to salt." With the first warm days of spring, the scup were wont to push into the bays and fiords and salt ponds in multitudes, standing in from the off-shore depths which had sheltered them and furnished them abundant food during the winter. Then followed a jubilee for poor and rich. Anybody who had a hook and line could catch a "mess of fish" before breakfast; scup he was sure to get, and he was likely to add a fat tautog or a striped bass. But when did a Yankee ever allow any peace to himself or his neighbor, or when did his mind, sleeping or waking, ever cease to dwell on the invention of some labor-saving machine? Hook and line was too primitive a method to be permitted in this age of improvement. About the year 1850, one Benjamin Tallman, being doubtless moved and abetted by the Evil One, conceived the idea of driving posts in a straight line running out to sea, and stretching thereon netting, so as to make a fence; and constructing at the end thereof a sort of inclosed yard. The schools of scup, as they coasted along the shore, ran against the fence, and turning their heads seaward were captured in the said yard. The inventor, in the pride of his heart, named the engine a "trap." He little knew that he had only made a small copy of a contrivance that was know to the Phœnicians, who used it along the shores of the Mediterranean and even on the coast of Spain. There, in later days, the Moors called it the *almadraba*, whence is derived the modern French word *madrague*. If the Moors created as much popular indignation with their *almadrabas* as Benjamin did with his "traps," the fact may account for their expulsion from Spain by the Gothic tribes. For twenty years war and recrimination prevailed between the trappers and the hook-and-line men, until, at length, both parties, like the Jewish factions, determined to a peal unto Cæsar, or as he is now called, Uncle Sam.

On the 19th of February, 1871, was passed a joint resolution of Congress, the preamble of which says: "Whereas, it is asserted that the most valuable food fishes of the coast and the lakes of the United States are rapidly diminishing in number, to the public injury, and so as materially to affect the interests of trade and commerce," therefore, resolved, that the President be authorized to appoint a Commissioner of Fish and Fisheries.

It has been truly said that when the critical moment arrives, the man appears also; and this critical moment made no exception to the rule. A man—nay, the man, was at once found in the person of Professor Spencer F. Baird. The Cæsar to whom the warring factions had appealed could not have sent forth a more judicious prætor. Mercifully he was not one of those self-taught men (of whom, for some occult reason, we are so proud), but a man of careful scientific training, and one as industrious in collecting facts as in arranging them. Also was he a man of a pleasant countenance and conversation, and well calculated to assuage the irritated feelings of the hook-and-liner, or to soothe the exasperated nerves of the trapper. Indeed, he seems to be the only individual in history who ever intervened between two combatants without receiving the blows of both.

Henceforth the history of American fishculture is contained in that of the United States Fish Commission. Its work, widespread and pushed with extraordinary energy, attracted the attention of the whole country. A greater part of the States appointed Fishery Commissions, which coöperated with, and were assisted by, that of the general Government. Its rapidly increasing value and power culminated in the great Fishery Exhibitions of Berlin and London, where the United States exhibits gained the chief prizes.

The history of the movement for the restoration of our fishes, may seem like a triumphal march; but in summing up its results, we cannot in honesty avoid the cold question *cui bono?* of what good is all this?

Up to the year 1880, the Fishery Commissions of the States and of the general Government had had appropriated $1,306,378. Has the country got a return of a million dollars' worth of additional fish?

In 1880, the total value of fishery products of the United States was $43,000,000, a less sum than that of the manufactures in a single Congressional District in the little State of Massachusetts. The two products show that real value is not always to be measured by money. The people of this country could have been deprived of the manufacture of that district, without recognizing their loss, but what an outcry would rise, were they cut off, even for a month, from cod and whitefish, lobsters and oysters.

Did the expenditure of $1,300,000 since 1866 add anything to the $43,000,000 which our fisheries produced in 1880? or did it pave the way for an increase?

To define these questions we must define what we mean by a decrease in fisheries.

When so many fish are annually taken from the waters, that the remainder are not numerous enough to produce a new crop equal in numbers to the old one, there must be a progressive decrease in the yield. It is a very simple matter to demonstrate such a decrease in ordinary rivers or in lakes of moderate size, where it is easy to show that spearing and netting of the trout on their spawning beds has diminished their numbers, or that the establishment of weirs has made whitefish scarce. In the bays and coves of the sea, also, where the waters are shallow, it is not difficult to show that the use of numerous fykes and trawl lines destroy the local fish, like tautog, rock bass and flounders. But, when we come to the schooling fishes of the open sea, it is very difficult to tell how much effect the hand of man has in lessening them. If, for example, we argue that traps and purse seines diminish the crop of menhaden by capturing them in enormous numbers, we leave out of mind the fact that these same traps and purse seines also capture bluefish and small sharks, which are thus taken from their occupation of killing menhaden. Again, when menhaden entirely disappear from a long stretch of coast, they are, in reality, no scarcer than before. They refuse to come to their wonted waters either because the temperature is too low, or because their favorite food is not to be found. They are not destroyed, only absent. There are familiar instances of such disappearance. The scup was plentiful when the whites first landed in New England; they afterward disappeared, and reappeared about the beginning of the present century. The bluefish was caught on the southern coast of New England from 1659 for more than a hundred years. In 1764 they disappeared, and after an absence of sixty-six years, they reappeared about 1830.

Another element that must be borne in mind in estimating the total catch of fish is the number of men and the kind of engines employed. If, for example, the population of a coast is scanty and only a dozen men go a-fishing, each of them is likely to have a good catch; but when the coast becomes thickly settled a hundred men will fish, and though each one may take but few, the catch of the hundred will be greater than that of the twelve.

In the light of the patient investigations of the past dozen years, it is safe to assert, first, that our fresh-water fisheries have in general greatly diminished since early times, and have in many cases been destroyed; secondly, that the local coast fisheries have also to a greater or less degree diminished.

What have our Fishery Commissions done to remedy or to palliate these evils? It is fair to say that they have done a good deal, and are in a good way to do more.

Their first, and perhaps most valuable, service has been to excite universal interest in our fisheries, and to draw general attention to their importance. The second great step in advance has been the accumulation of a vast amount of accurate information concerning the number and variety of our fishes, their food, manner of breeding, condition of life, migrations and stages of growth. The third degree of progress has been fishculture, which may be called negative and positive; negative when obstructions to the increase of fish, such as improper apparatus and impassable dams, are removed; positive when fishes are artificially bred, or when new species are introduced from distant countries.

It may be fairly said that both forms of culture have already given considerable results. Of the success of negative culture, a familiar example is that of the smelt, which a few years ago had grown scanty in numbers and small in size on the Massachuseets coast, because the breeding fish were captured in the brooks when crowded together on their spawning beds. The prohibition of this kind of fishing was followed within three years by the restoration of the smelts to their former numbers and size.

The best instance of positive culture is that of the California salmon in the Sacramento River, where Livingston Stone, by annually turning into the river 9,000,000 young fry, artificially hatched, increased the yearly catch from 5,000,000 pounds to 9,500,000 pounds.

Wide experience in the hatching of shad and whitefish proves pretty clearly that a marked increase may be obtained, if the work be done on a scale large enough and that an amount of work insufficient to produce a positive increase will, nevertheless, check the decrease of these species.

In a word, artificial breeding, by greatly augmenting the proportion of eggs impregnated and by protecting them until hatched, presents a great advantage over the natural process, and gives us an available method of preserving many important fisheries. But to produce results of commercial value, this waterculture must be practiced as universally and methodically as is agriculture.

It is not the custom of Americans to stop half way in a profitable enterprise. Therefore I do not doubt that in the next generation some of our chief fisheries will be maintained by an established system of artificial culture.

Perhaps, in that day the honorable guild of fishmongers will erect a monument of their gratitude, and will inscribe on its tablets the names of scientific men who have in our time labored.

The chairman then introduced Hon S. S. Cox, who spoke as follows:

SPEECH OF HON. S. S. COX.

LADIES AND GENTLEMEN: It is my pleasure and privilege this evening to move a vote of thanks to the Hon. Theodore Lyman for his very felicitous and learned address upon this annual occasion. I am told that by a custom which now obtains in this museum, I am expected to speak to my own motion. If I were in another body I think I should rule it out of order, but I have a special gratification this evening in having a Congressman appear here so thoroughly learned in marine zoology. There is sitting before me, I notice, an ex-member of Congress, the Hon. Mr. Roosevelt (and I beg to say that in this particular province an x is not an unknown quantity), who has also devoted his services, his intellect, and sometimes his sportive nature to the same object as my distinguished friend from Massachusetts. But a New York man has not the same right to talk fish as a New England man. It is the peculiar privilege of the latter, as any one can see who will examine the last census, and you may have noticed all through the remarkable address of our friend that he is associated with the fish interest and with the dams of Massachusetts. I cannot say that I was shocked or astonished at his description, and at hearing the names of the various little streams of that State. We have always heard of them in the River and Harbor Bill. [Laughter.] But I was struck by one thing, namely, that he took very good care in his discussion to connect science with religion. And even at the falls of the Pawtucket, where he said the manufacturing interests did not harmonize with those of fisheries, he associated the old Puritan doctrine with religion, revelation, science and fishculture, which were almost one and the same thing. And it is simply true. If you look at the escutcheon of the State of Massachusetts you will find it to be a codfish, and nearly all the quarrels of that Puritan State have arisen from the same question that vexed the old Hollanders in early days as to whether the codfish took the hook or the hook took the codfish. [Laughter.] I do not know whether that point is settled yet. The State of Massachusetts should be proud of her fisheries. I remember having the honor of being arrested at 3 o'clock in the morning with General Butler, in the House of Representatives, in my attempt to break down the proposition to pay over to England the $5,500,000 growing out of the fishery award. I heard Mr. Rice, another member from Massachusetts, contend for the abrogation of the fishing treaty, which now allows fish to come in free from the Dominion of Canada. I sustained him in that, not because I was unwilling to have fish come in free to this country, but because I did not want fish to come free from Canada or Great Britain, who had cheated us out of $5,500,000. Throughout this whole subject Massachusetts has played a most prominent part. Why not? In early days the Puritans came here to worship God and catch fish. [Laughter.] New England is the home, if not the mother, of invention. The feature which most interests us here to-night is the inventive faculty. It has been shown in such a remarkable degree in fishing, and chiefly in New England, in connection with improvements for the catching of fish. These were displayed on a magnificent scale at Berlin in 1880, and in London in 1883.

You may remember that a certain weaver at Lyons invented his famous net, which revolutionized fishing. They arrested him, and the great War Minister Carnot, sent for him to come before the great Napolean. The Minister said: "Are you the man that can do what God cannot?—tie a knot on a stretched string?" And they put him gently under arrest, for fear he would go to England and there introduce his net.

Since then we have made remarkable strides in the invention of fish apparatus. Our fishing schooner attracted universal admiration in London. We now use steam as an adjunct and the great purse-seine. In the whale fisheries harpoons are no longer of the old sort, but explosive. Not satisfied to blow up dynasties with dynamite, we blow up whales with it (Laughter.)

But the great element of advancement was not discovered perhaps as early as some think—in Japan or China. Our learned friend fixed it at about 150 years ago, but I have data to show that this discovery of fishculture was made in *Ohio*! (Laughter). I know the man! (Prolonged laughter). His name was Dr. Garlick of Cleveland. His discovery like others was not complete at first. It was necessary that New York should perfect what Ohio had begun, and with the aid of several New York men, prominent among whom was my honorable friend in front (Hon. R. B. Roosevelt), this science was brought to perfection. By aiding nature, and with the skill of such men, these investigations have been prosecuted. Congress has been enabled to see something of the inestimable value of food fishes. Out of these investigations came the United States Fish Commission in 1871, for the creation of which I had the honor to vote. We should in a body pass a vote of thanks to Congress. From it came the appropriations that warmed up the hatching places. They helped on the grand results. So that now we can send from one end of the country to the other over car-wheels, tanks of fish. We all have, I trust, or ought to have, a deep interest in the fisheries.

But I forgot that I am speaking on a mere motion of thanks. Besides, I yesterday had occasion to speak at length in Congress in favor of Professor Baird's bill for the preservation of the shad and herring of the Potomac. We carried it handsomely.

I have already spoken too long. I meant merely to refer to what my friend has stated so eloquently, and to make the motion which has already been made. I cannot, however, cease without referring to one matter, which is, that in our legislative action in Congress in connection with fishing and fishculture, we have not been behind other nations, or rather legislative bodies. It is pleasing to know that we have furnished all the appropriations necessary to enable us to meet the nations of the world, both at Berlin and at London. I believe such appropriations should continue to be made. They will enable us to solve, as no other nation can, the problem which you fishculturists are trying to solve here, and which France, Germany, and England are solving. With scientific applications to the multiplication of fishes, we shall always, with the aid of liberal appropriations from Federal and State governments, not only be able to increase our food supply, but also to meet the nations of the world in happy rivalry and successful competition. I will say in conclusion: All honor to men engaged in this work! All honor to the Congressmen who can elucidate its value to the satisfaction of the people. All honor to the men, nay to this chief of men,

MR. F. WINDHOLZ'S BLUE BELTON ENGLISH SETTER BITCH "PRINCESS PHŒBUS."
Winner of First in Puppy Class, New York, 1884.

Professor Spencer F. Baird, who received the grand medal from the Emperor of Germany at Berlin, as the greatest of all living fishculturists. All honor to Professor George Brown Goode and his associates at Berlin and London, who bore away the highest prizes given in Germany and England. I want these honors to come while they are full of life, faith and hope, and can enjoy them. They are worthy of the commendation of Professor Huxley, who said that Professor Baird, Professor Goode and his associates, by their energy, patience, and scientific research, have made the world more and more comfortable for mankind. By their exertions they have advanced into high favor, the doctrine of applying science to human ends. I, therefore, ask you, Mr. President, to put the question of thanks to Professor Lyman for his very able address. I wish I could add to it that emphatic sentiment of the people, who in their homes all through the land gratefully commend the efforts of the United States Fish Commission.

The president of the meeting proposed a vote of thanks to Hon. Theodore Lyman for his eloquent and instructive address.

Hon. James B. Groome, referring to Hon S. S. Cox's statement that Ohio had originated and New York perfected fishculture, remarked: "I beg to say also that Ohio produced, and New York perfected, the model Congressman." (Applause.)

The chairman proposed a vote of thanks to Hon. S. S. Cox, which was carried unanimously.

The meeting then adjourned to meet next day.

THE GREAT FALLS FISHWAY.—The plans for the McDonald fishway at the Great Falls of the Potomac have been accepted by Prof. Baird and transmitted to Maj. Lydecker, of the U. S. Engineers, under whose direction the work will be done. This insures more thorough work than if done by contract, and this fishway will give opportunity for careful and critical study of details. The total hight to be surmounted is 71.9 feet, this rise being accomplished in a horizontal distance of 2,600 feet, measuring from the crest of the dam to the level of low water. The greater part of the ascent to be overcome is in the lower part of the section surveyed, the total elevation being accomplished by a succession of abrupt declivities, rising successively to higher levels. It is estimated that it will require for this work 202 cubic yards of cut stone masonry; 90 cubic yards of coping stone masonry; 479 yards of concrete masonry; 93,600 feet of timber, B. M.; 8,532 lbs. iron; 17,732 short bolts, 2 to 6 in.; 51,664 screws, 2½ to 9 in.; 1,655 cubic yards of rock excavation; 750 cubic yards of earth excavation; and 110 cords of riprap. The work will soon begin. Col. McDonald expects to sail for Scotland about July 10, the Scotch Commissioners having engaged him to construct a fishway on a salmon river, which he expects to complete in time for the fall run of fish.

SOME OTHER MAN is always the one you think will get hurt by accident, and the "other man" thinks it will be you! If he is right, you will be sorry you didn't insure in the Travelers, of Hartford—or your family will.—*Adv.*

The Kennel.

FIXTURES.

BENCH SHOWS.

Sept. 16, 17 and 18.—Collie Bench Show and Field Trials of the Ontario Collie Club, Toronto, Ont. Entries close Aug. 23. Mr. H. J. Hill, Secretary, Toronto.

Sept. —.Bench Show of the Philadelphia Kennel Club. Mr. Benj. C. Satterthwaite, Secretary.

Oct. 5, 9, 10 and 11.—Third Annual Bench Show of the Danbury Agricultural Society, Danbury, Conn. E. S. Davis, Superintendent, Danbury, Conn.

Oct. 21, 22, 23 and 24.—First Annual Fall Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Chas. Lincoln, Superintendent.

FIELD TRIALS.

Dec. 8.—Sixth Annual Trials of the National American Kennel Club at Canton, Miss. D. Bryson, Secretary, Memphis, Tenn.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1319.** Volume I., bound in cloth, sent postpaid, $1.50.

POINTERS AT NEW YORK.

Editor Forest and Stream:

Mr. Aldrich seems to look upon the forty signers of that protest somewhat as Ali Baba did upon another famous forty. They are all very, very wicked men. But why should I be especially chosen out of the forty, to be the text of Mr. Aldrich's sermon, when so many of them are better known, both as breeders and exhibitors, than my humble self. I have not said that Bang Bang was throaty. I have not said that he had a black nose. I have not said he was cock-eyed. What is the head and front of my offending? But to relieve Mr. Aldrich's mind I will explain my position in regard to the protest. I was told that a protest was being signed against the judging of the pointers at New York, and asked if I, as a breeder, wished to sign it. In my letter of June 5, from which Mr. A. quotes one paragraph, I expressly gave my reasons for thinking Mr. E. C. Sterling no judge of a pointer. I readily then signed my name to a protest which I thought, and still think, was intended to convey the objection of pointer breeders to that gentleman as a judge, and to prevent his being employed in that capacity at future bench shows. The protest as printed was worded a little differently from what I had expected, but the substance being the same, I did not cavil at the form.

As regards Meteor, I have never undertaken to pick him to pieces, but I frankly say that after hearing a full description of him from Major Taylor, who is an open admirer of the dog, and hearing more of him from others who know what a pointer should be, as well as or better than I do, I do not believe he can beat one side of Beaufort in a large pointer class and under a judge who knows what a pointer is. Mr. Aldrich seems to be under the impression that I am fighting Mr. Mason's battles against the W. K. C. Such is not the case. I consider Mr. Mason amply capable of taking care of himself, and when I condemn Mr. Sterling's judgment it is with no feeling against the W. K. C. I am only championing Beaufort against his foes, and would do so whoever owned him and whoever ran him down. If Meteor is such a grand dog why run Beaufort down? Were Meteor mine I should like Beaufort to be all his friends claim him to be when my dog had beaten him. Every fault that is found in him takes a leaf from Meteor's laurels, and if he is as Mr. Cornell and Mr. Aldrich would fain paint him there is not much glory in beating a cripple. And now I have explained, I want some explanation from Mr. Aldrich. What does he mean by "men like this," as applied to me? If I have not forgotten my grammar "this" needs another word to make sense, and applied to the rest of his sentence it is either ungrammatical or shows that Mr. Aldrich does not understand the wording of the protest. What is "hard" in my signing my humble name to that protest, and who it is "hard" on I cannot say. Perhaps Mr. Aldrich can.

T. B. DORSEY.

Editor Forest and Stream:

It is vain for Mr. Mason to say that Mr. Cornell began the fuss. He certainly cannot deny that his attempt on me was altogether without provocation on my part, yet he deliberately chose to make it a personal matter.

If he opines that only the owners of good ones are entitled to discuss dogs, I might call attention to the fact that I have owned, and indeed do now own, dogs that have won both in bench shows and field trials, first-class events at that, and not tail-end prizes either. But then, as we all know, Mr. Mason would say there was no competition, or if there was then the judges were fools.

This hostility to the record amounts, on Mr. Mason's part, to an assumption of something like infallibility. Whenever a dog he dislikes, as Bang Bang or Thunder, wins, as such ones most commonly do, why then it don't count, that's all. But before he is publicly installed as pope of dogdom, he must make a better case than against Thunder. No such loose statement of the facts, even if what he states are facts, will suffice to discredit a public record. But take it all as he gives it, and it is as strongly against him as could be wished.

There were no birds, he says. Well, then, what were the points upon which the decision was reached? Evidently range, pace, quartering, obedience, etc. If he was such an idiot as represented, it is apparent that he would lack in all those points which are dependent on intelligence, and there would be little left for him to win on but range and pace, which are precisely the points for which he would be disqualified if he had such a defect as is affirmed. Mr. Mason will find that before he will be able to overthrow Thunder's record he will have no resource left him but a resort of personal vilification of those who made the record.

Now I want it understood that I never write anything in favor of my own works, and will not now do so, but I will give a little "fact, hard as granite," that will show beyond dispute that either Mr. Mason is guilty of intentional unfairness, or of complete ignorance of the subject he makes so free to discuss. In my picture of Thunder, with the dog in the position indicated and the spectator at the point of view chosen, and clearly established by the composition of the picture, such a crook as Mr. Mason describes in his criticisms of Thunder's leg could not be detected with the naked eye, or shown by a photograph, even if it were present in the degree he claims. Now he either knows this or he does not, and I care not which horn of the dilemma he chooses.

It is neither necessary nor proper to bring private persons or private expressions of opinions into a public discussion. What cannot be shown by proofs that are public and open to the inspection and verification of all, I am quiet willing to forego. So instead of giving the private conversation of any party to show what "notoriety" there has been in regard to Thunder's field qualities, I will allude to the fact that at Vincennes, Pittsburgh gentlemen, who were well acquainted with the dog and with his owner, backed him in the pools, and against no less a crack than Gladstone!

It is not news to anybody what kind of dog Mr. Mason favors, we all knew he went in for a distinctly show animal, as do a great many others, all of which is their right and privilege. There are, however, many who go in for field quality, and care less for ornamental points. It is not yet proven which of these opposing parties is in the right. The question is open for discussion, and any person, however humble, who can give valuable facts looking to its elucidation, will be listened to with pleasure, but mere assertion, personal denunciation and bounce will not impose upon anybody.

J. M. TRACY.

GREENWICH, July 5, 1884.

NEW YORK FALL DOG SHOW.

THE first annual fall bench show of the Westminster Kennel Club will be held at Madison Square Garden, Oct. 21, 22, 23 and 24. With the exception of bloodhounds, deerhounds, greyhounds and fox-terriers, the show will be confined to the non-sporting classes. The premium list, which we give below, contains ninety-two classes. The prizes offered are liberal, and perhaps as well apportioned as possible. Should the fanciers of any breed feel that they are not sufficiently noticed, we can assure them that a full entry will result in a better classification and larger prizes next year, and we presume that the management would cheerfully sub-divide at this show all of the classes where the number of entries is sufficiently large to make it advisable. We are glad to notice that the club have taken a new departure, and adopted a rule debarring all dogs from the champion class who have not won three first prizes either in open, champion or extra champion classes. We trust that all future shows will, now that the ice has been broken, adopt the same rule. They have also added to the list of recognized shows those held at Crystal Palace, Alexandra Palace and Birmingham, England. The entries close Oct. 6. Following is the premium list as corrected to date:

MASTIFFS.—Champion dogs $20, bitches the same; open, dogs $15, $5 and medal, bitches the same; an extra prize of $10 for best brindle dog, best brindle bitch the same; puppies, dogs $10 and medal, bitches the same.

ST. BERNARDS.—Champion rough-coated dogs $20, bitches the same; open, dogs $15, $5 and medal, bitches the same; puppies, dogs $10 and medal, bitches the same. Champion smooth-coated dogs $20, bitches the same; open, dogs $15, $5 and medal, bitches the same; puppies, dogs $10 and medal, bitches the same.

NEWFOUNDLAND.—Black, champion dogs or bitches $20; open, dogs $10 and medal, bitches the same; other than black, dogs or bitches $10 and medal.

GREYHOUNDS.—Champion dogs $20, bitches the same; open, dogs $10 and medal, bitches the same; puppies, dogs or bitches $10 and medal.

DEERHOUNDS.—Champion dogs or bitches $20; open, dogs $10 and medal, bitches the same; puppies, dogs or bitches $10 and medal.

ENGLISH BLOODHOUNDS.—Open, dogs or bitches, $10 and medal.

FOX-TERRIERS.—Champions, dogs $20, bitches the same; open, dogs $15, $5 and medal, bitches the same. Wire-haired, dogs or bitches, $10 and $5; puppies, dogs $5 and medal, bitches the same.

SHEEP DOGS.—Champion dogs $20, bitches the same; open, rough-coated, dogs $10, $5 and medal, bitches the same. Smooth-coated, dogs or bitches $10 and medal; puppies, dogs $10 and medal, bitches the same.

BULLDOGS.—Champion dogs (any weight) $20, bitches the same; open, dogs (45 lbs. and over) $15, $5 and medal, bitches (35 lbs. and over) the same; dogs under 45 lbs. the same, bitches under 35 lbs. the same; puppies, dogs or bitches $5 and medal.

BULL-TERRIERS.—Champion dogs (25 lbs. and over) $20, bitches the same; dogs under 25 lbs. $20, bitches the same; open, dogs (25 lbs. and over) $15, $5 and medal, bitches the

same; dogs under 25 lbs. the same, bitches the same; puppies, dogs or bitches, medal.

BLACK AND TAN TERRIERS.—Dogs or bitches $10 and medal.

SCOTCH TERRIERS.—Hard-haired, dogs or bitches $10 and medal.

TERRIERS.—Rough-haired dogs or bitches $10 and medal.

DANDIE DINMONT TERRTERS.—Dogs or bitches $10 and medal.

IRISH TERRIERS.—Dogs or bitches $10 and medal.

BEDLINGTON TERRIERS.—Dogs or bitches $10 and medal.

SKYE TERRIERR.—Champion dogs or bitches, champion medal; open, dogs or bitches $10, $5 and medal.

YORKSHIRE TERRIERS.—Champion dogs or bitches over 5 lbs., champion medal, under 5 lbs. the same; open, dogs or bitches over 5 lbs., $10, $5 and medal, under 5 lbs. the same.

TOY TERRIERS.—Rough-coated, other than Yorkshire, dogs or bitches under 5 lbs. $10 and medal, smooth-coated the same.

KING CHARLES SPANIELS.—Dogs or bitches $10 and medal.

BLENHEIM SPANIELS.—Dogs or bitches $10 and medal.

JAPANESE SPANIELS.—Dogs or bitches $10 and medal.

PUGS.—Champion dogs $20, bitches the same; open, dogs $10, $5 and medal, bitches the same; puppies, dogs or bitches, medal.

MALTESE DOGS.—Dogs or bitches $10 and medal.

ITALIAN GREYHOUNDS.—Dogs or bitches $10 and medal.

POODLES.—Dogs (black) $10 and medal, bitches the same. white, dogs or bitches $10 and medal.

DALMATIANS.—Dogs or bitches $10 and medal.

MISCELLANEOUS.—Dogs or bitches not classed, over 25 lbs., $10, $5 and medal, under 25 lbs., the same. Should there be two or more in either class of the same breed a separate class will be made for them, and regular prizes awarded.

MISTAKE IN PEDIGREE.

Editor Forest and Stream:

In reference to the above entitled article contained in last week's issue of FOREST AND STREAM I deem it a duty, not only to myself, but to others, who may be interested in the matter, to make the following explanation:

The pointer bitch Fancy, purchased by Mr. Miller [about 6 months ago), was originally owned by a Mr. M. Walrath, of East Albany, N. Y.; this gentleman obtained her from a Mr. P. Halie. Mr. Walrath obtained the pedigree from Mr. R. G. Wilbur of Albany, to whom it was given by Mr. Halie, pending previous negotiations for the sale and purchase of the bitch between the two latter parties (the pedigree referred to is the one now in question). Mr. Wilbur told me afterward that he was assured positively that the bitch was as represented; that she was one of a litter of nine puppies (four dogs and five bitches) and whelped in November or December (I have forgotten which), in 1881. Here I desire to make a correction on the part of Mr. Miller, who is in error (unintentional I feel assured, however) in regard to the age given at time of purchase by him, which was two and not three years, which corresponds with the date of birth as previously given to me, making the bitch about two years seven or eight months old at the present time.

It is not my custom nor has it ever been to guarantee the pedigree of any stock not bred in my own kennel or from my stock unless I am positively assured beyond any question of doubt as to the correctness of the breeding, and again I regret that Mr. Miller is laboring under an erroneous impression in regard to my certifying as to the pedigree's being correct, not but what it may be so, and beyond a question of doubt with others, but simply because it is not my custom to do so. I have always since my first acquaintance esteemed Mr. Miller as a gentleman, and I believe him entirely incapable of knowingly misrepresenting any stock that he may have for sale. Both Mr. Walrath and Mr. Wilbur, the parties referred to, are gentlemen that are held in high esteem, and both are positive in their assurances as to the bitch's being bred as stated. Mr. Halie I never knew personally, but only through the above named parties, both of whom place entire confidence in him and his statement.

In regard to a technical error in a pedigree, if the pedigree is otherwise correct (*i. e.*, correct as to sire and dam), due allowance should always be made. Mr. Dilley should and undoubtedly does know whether his bitch was bred to Croxteth at all, and if so at what time, and if there was any progeny what disposition was made of them. Either of the parties I have referred to will sustain me *verbatim et literatim* in what I have said, and any communications to them on the subject I am sure will be cheerfully and promptly answered. My specialty in breeding is almost entirely and exclusively Irish setters, and on the subject of pointers and their pedigrees I consider myself but a poor authority. W. N. CALLENDER.

ALBANY, N. Y.

DEATH OF GATH.—We have received a dispatch from Memphis, Tenn., announcing the death, on July 1, of the famous English setter dog Gath, from the effect of a dose of poison administered at Fairmont, Minn. The history of Gath is well known to the readers of FOREST AND STREAM. A capital likeness of him may be found in our issue of Dec. 6. We then said of him: "The setters at this last meeting made a very strong class, and Gath stands at its head. We believe him to be the very best setter in America to-day, and the work which he did in the concluding heat of the All-Aged Stake was marvelous." In describing this heat we said: "The work in this heat was very near perfection, and fully equal if not superior to that in the heat between Gath and Pink B. Indeed, so bewildering was the nature of the performance that we could scarcely realize that we were not upon enchanted ground, and following the evolutions of supernatural dogs." Gath made his first appearance in public in the National Derby of 1882, where he acquitted himself very creditably, but was not placed. Last year, in the hands of Mr. H. M. Short, he won first in the Eastern Field Trials All-Aged Stake, second in the National All-Aged Stake, and at the same meeting divided the champion prize with Bryson's Sue. At the Southern States Trials, a week later, he won second in the All-Aged Stakes and the champion prize. He was shown on the bench but twice. At New Orleans last winter he won first in the open class, the special for the best English setter and three specials for dogs that had been placed at field trials. At St. Louis last April he won in the champion class. He was a finely formed animal with a wonderful turn of speed, and possessed one of the best noses that we ever saw. He was also very stylish when on game. This is a peculiarly aggravated case of dog poisoning, and Mr. Crawford will have the sympathy of all owners of valuable dogs.

THE WARWICK SHOW.—London, S. E., June 20.—*Editor Forest and Stream:* Your correspondent "Lillibulero," in your issue of May 22 last, has indulged his imagination in a description of the judging at this show, and has given it such reins that it appears to have run away with the owner, and it is a difficult task to find out where he gains control and is able to assume the sober, steady pace of truth. He says, "Well, but look here, this did not happen at Warwick, so adieu, imagination, and return hard facts." The hard facts are hard, but the facts are mere presumptuous outpouriugs of an ignorant conjecture, which he seeks to impose on the credulity of his readers. His remarks which follow this announcement are directed against two gentlemen, most honorably and deservedly respected in the mastiff world, and are as far from the truth, as regards the inuendos which they contain, as any imagination, filled with "envy, hatred and all uncharitableness," can make them. He, evidently, knows little of Mr. Portier or Mr. Taunton. He describes the former as "having judged before, but he does not remember where;" and says he has written "over the *nom de plume* of 'Anglo-American.'" It should be "Franco-American," some of whose letters have been among the most able of those appearing in our journals. But did your "Lillibulero" know anything of mastiffs he would be aware that Mr. Portier's letters on that subject were signed "County Monaghan." I shall hardly be accused of partiality, for it is well-known that "County Monaghan" has been my fiercest and most powerful opponent in the controversy on "Mastiffs and their Points;" but always an opponent who fought fairly and gave his reasons for any differences of opinion. Mr. Taunton, as a gentleman of unimpeachable honor, and as a breeder of some of our best mastiffs and foreign dogs, enjoys the esteem of all who are interested in these breeds and is too well known to require any eulogies. The stud prize at Warwick, was awarded to Mr. Taunton's Cardinal, and my own dogs, who represented the progeny of Crown Prince, were beaten. Under the circumstances of the case, as explained by Mr. Portier in the *Live Stock Journal*, I see no reason to cavil at his decision, and feel quite sure it was a conscientious one. I do not like to see exhibitors grumbling at the verdict of those judges whom they have themselves asked to adjudicate, and still more object to a reporter who tries to make people believe that he casts no "suspicion" on a judge's "strict probity," at the same time insinuating that the judge and his friend are "Arcades ambo," which those versed in the comic Latin grammar know how to translate. This is giving "a handle to the party of envy, hatred and all uncharitableness," in which malice may be very safely included. Hoping you will find room in your paper for this protest, as I know Americans like fair play as well as Englishmen, I beg to sign myself.—I. SIDNEY-TURNER.

DOGS BOARDED.—Mr. Wm. H. Pierce advertises to board and condition a few dogs. We have no doubt he will readily obtain all he wishes, as the appearance of his dogs when shown is ample testimony as to his ability to put them in condition and to keep them looking their best.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Duke of Hudson, Don, Spot and Lucy. By Mr. Charles H. Malleson, Hudson, N. Y., for King Charles spaniels, three dogs and one bitch, whelped April 27, 1884, by Duke of New York out of his Jumbo.

Belton II. By Mr. B. A. Gage, Pawtucket, R. I., for white, black and tan English setter dog, whelped April 30, 1884 (Yale Belton—Topsy.

Falka. By Mr. Lawrence M. Kostright, Bristol, R. I., for red Irish setter bitch, whelped Jan. 21, 1884, by champion Glencho out of Bess (Chief—Tilley).

Burr. By Mr. C Frank Greene, Jersey City, N. J., for beagle dog, whelped Feb. 21, 1884, by Joy out of Nelly.

Dane Bondhue. By Messrs. Walter and Mason; Providence, R. I., for black, white and tan English setter dog, whelped Feb. 27, 1884, by Gus Bondhue (Dashing Bondhue—Novel) out of Countess Mollie (Count Noble—Spark).

BRED.

☞ *See instructions at head of this column.*

Rena—Agrippa. The Riverview Kennel's (Clinton, Mass.) mastiff bitch Rena (A.K.R. 262) to their Agrippa (A.K.R. 449), May 13.

Delph Viva—The Prince. The Riverview Kennell's (Clinton, Mass.) imported mastiff bitch Delph Viva (E.K.C.S.B. 14,788) to Mr. J. Royle's (Manchester, England) The Prince (Crown Prince—Lady), May 2.

Medea—Dash III. Mr. C. D. Foss's (Boston, Mass.) English setter bitch Medea (Bute—Pride) to Mr. A. M. Tucker's Dash III., May 11.

Hilda V.—Agrippa. The Riverview Kennel's (Clinton, Mass.) mastiff bitch Hilda V. to their Agrippa (A.K.R. 449), May 30.

Antea—Agrippa. The Riverview Kennel's (Clinton, Mass.) mastiff bitch Antea (A.K.R. 244) to their Agrippa (A.K.R. 449), May 2.

CORRECTION.—In the notice last week of the breeding by Mr. C. H. Drayton's Vic to Glencho, Elcho is given as his sire. It should read Echo.

WHELPS.

☞ *See instructions at head of this column.*

Jumbo. Mr. Charles H. Malleson's (Hudson, N. Y.) King Charles spaniel bitch Jumbo (Prince—Gipsey), April 27, four (three dogs), by Mr. A. W. Lucy's imported Duke of New York (Don Carlo—Queen of Bow).

Nora. Mr. Joseph Hayes's (Boston, Mass.) imported red Irish setter bitch Nora (Cigar—Belle), July 7, eight, by Mr. J. J. Giltrap's (Dublin, Ireland) champion Garryowen (E.K.C.S.B. 8,262).

SALES.

☞ *See instructions at head of this column.*

Radnor—Nora whelp. Orange and white English setter dog, whelped April 25, 1884, by Mr. Manasseh Smith, Woodford, Me., to Dr. Charles D. Smith, Portland, Me.

Ruth. White, with orange ears, English setter bitch, whelped August, 1881 (Dashing Lion—Armida), by Mr. E. W. Jester, St. George's, Del., to Mr. E. S. Hawks, Ashfield, Mass. (Wrongly given as Highland Kennel, June 26).

Belton II. White, black and tan English setter dog, whelped April 30, 1884 (Yale Belton—Topsy), by Mr. H. A. Bailey, New Britain, Ct., to Mr. B. A. Gage, Pawtucket, R. I.

Pet Berwyn. Black, white and tan English setter bitch, whelped June 2, 1883 (Dashing Berwyn—May. Druid), by Mr. J. A. Rockwood, West Medford, Mass., to Mr. Walter B. Peck, Pawtucket, R. I.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Pride of Columbia. White, with orange markings, English setter dog, 2½ years old, by Cossack (Don—Fairy) out of Ophelia (Pontiac—Mollie Bawn), by Hon. John W. Browning to Mr. Stewart M. McKay, New York.

DEATHS.

☞ *See instructions at head of this column.*

Gath. Black, white and tan English setter dog, 3 years old (Count Noble—Peep o' Day), owned by Mr. W. J. Crawford, Memphis, Tenn., July 1, at Fairmont, Minn., from poison.

Taurus III. Mastiff dog (A.K.R. 1,152), owned by Mr. B. R. Hampson, St. Louis, Mo., June 17, from pneumonia.

Lorna II. Deerhound bitch, 14 months old (Oscar—Lorna), owned by Prof. Theodore A. Blake, New Haven, Ct., from distemper.

Rifle and Trap Shooting.

RANGE AND GALLERY.

LOCKLAND RIFLE RANGE.—At their Range, June 27, the Lockland Rifle Club made the following scores: Geiger 169, T. Smiley 168, Stickles 162, Best 161, Forbis 161, Critchfield 159. Neiman 157, R. Mace 157, P. Mace 157, Richards 153, Poole 153, Dunn 151, Stevenson 148, Freechey 146, Roll 145, W. Smiley 145, Musselman 143, Potter 139, J. J. Smiley 138, Harrison 118. The average, 151¼, is very good. The shooting was off-hand 200 yards at a Massachusetts target. Our range is situated at Maplewood, just ten miles north of Cincinnati, Ohio. When Mr. W. M. Farrow visited us we were organizing the Rifle Club and he set us a pattern of 165, stating that when any one of us beat that score he would come to our range and set us another pattern. We would be happy to see Mr. Farrow here once more and hope that this will be the means of inducing him to come.—A. R. R.

GARDNER, Mass., June 25.—Members of the Gardner Rifle Club who went out to Hackmatack range to-day, made the following scores, using the American decimal target, distance, 200yds., shooting off-hand, with a possible 100: J. M. Dodge 86, A. Mathews 82, G. F. Ellsworth 81, G. C. Goodale 78, W. C. Loveland 69, George H. Hisler 56.

BULLSHEAD RIFLE CLUB, July 3.—12-ring target, possible 120: A. Lober 117, G. Zimmerman 115, M. Dorrler 115, J. Schrarder 112, G. D. Johnson 111, C. Rein 111, D. Loulzki 104, S. F. C. Weber 105, J. F. Campbell 102, W. Shaw 89.—A. LOBER, Sec'y.

BOSTON, July 4.—There was a large number of riflemen at Walnut Hill to-day, and, with fine conditions, some good work was done. A match was shot on the range between teams representing the Lawrence Rifle Club and the home association, the former winning. Matches B, C and E, which had been running some time, closed to-day. The records made in these contests are appended, as well as the scores in the other contests of the day:

Creedmoor Practice Match.

J W Frost	5555544544—46	D Kirkwood (mil.)	5444445444—42

A B Archer	44	43	44	43+ 9	—180

July 5.—There was a very slim attendance of shooters at the range at Walnut Hill to-day, in fact the regular "after a holiday crowd," owing no doubt in part to the threatening weather. The clouds were dark and heavy, with alternating sunshine and shadow, with a stormy "fish-tail" wind. Despite this fact, however, Mr. Berry made a fine 47, Creedmoor, and Mr. C. H. Brown a clean score of 100, decimal rest target, and followed it with 8 centers, making 18 consecutive shots put into a 3-inch circle. This is all considered remarkable shooting, when the weather conditions are observed and it is remembered that each gentleman was using a 32-caliber Maynard rifle.

CREEDMOOR.—The members of the Amateur Rifle Club of New York shot at Creedmoor on Thursday, July 3, for the Leech cup, given in 1875 by Maj. Blennerhasset Leech of Ireland. It was won by W. W. De Forest, who made the highest score ever made on the range, 221 out of a possible 225, namely 75 at 800yds., 74 at 900 and 72 at 1,000. Before the 1,000yds. range was shot, a heavy rain storm set in, and the weather conditions at the range made the score most remarkable. There were but six competitors.

	800yds.	900yds.	1,000yds.	
W W DeForest	75	74	72	—221
H P O'Neil	74	71	69	—214
Col H F Clark	75	64	52	—201
L Geiger	68	70	61	—199
N D Ward	75	69	55	—199
J W Todd	65	67	64	—196

THOMASTON, Conn., June 28.—At the weekly shoot of the Empire Rifle Club to-day, the following scores were made:

W H Dunbar	10	11	10	11	11	10	10	11	9	12	—105
G A Lemmon	9	9	11	11	11	9	11	10	10	12	—103

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

ASSOCIATION OF THE CAROLINAS.

Editor Forest and Stream:

"The day we celebrate" is not an unfitting one on which to inform the readers of FOREST AND STREAM, that the Sportsmen's Association of the Carolinas propose to have a trial of skill at Columbia, S. C., on July 29, 30 and 31. I am authorized to state that visitors from all sections of the country are cordially invited to participate, and we

promise to show them that whatever expertness they may exhibit, we have several members who will be able to make their triumph an honorable one. Not being blessed with much spare cash, our prizes are not large, but such as they are, any one is welcome to get them, if they can. Hotel accommodations are good and the grounds are eligible. WEELS, President.

ROCKINGHAM, N. C., July 4.

TOPSHAM, Me., July 4.—The regular shoot of the Riverside Club on this date was made a side shoot, and was a very interesting and somewhat exciting affair. Twenty clay-pigeons, 10 single and 5 pairs, an i 20 glass balls, 10 singles and 5 pairs, the best individual score to take club badge:

Ties on 24: Tinker 4, Crandall 5. NARRAGANSETT.

WELLINGTON, Mass., July 5.—There were some forty-five sportsmen gathered at the grounds of the Malden Gun Club, at Wellington, to-day. The leading events were the contests for the gold and leather badges, Wemyss taking the former and Scott the latter. The other events were:

First event, five birds, straightaway, 21yds.—Snow and Dickey first, Adams second, Goodnow third.

Second event, five balls, 100yds. rise—Dickey and Symmes first, Nye second, Scott third.

Third event, five birds—Shumway first, Scott and Morrill second, Hopkins third.

Fourth event, five birds—Hopkins first, Morrill and Scott second, Goodnow third.

Fifth event, three pair doubles—Hopkins and Morrill first, Adams second, Green and Scott third.

Sixth event, five balls—Nye and Adams first, Morrill and Hopkins second, Green and Scott third.

Seventh event, five birds—Morrill and Nye first, Scott second, Adams third.

Eighth event, five birds—Nye and Goodnow first, Nichols and Dickey second, Hopkins third, Adams fourth.

Ninth event, five birds—Dickey and Nye first, Hopkins and Morrill second, Scott and Nichols third.

Tenth event, five birds—Snow first, Dickey and Morrill second, Nye third.

Eleventh event, five balls—Morrill and Dickey first, Scott and Symnes second, Foster third.

Twelfth event, three pair birds—Dickey first, Goodnow and Nichols second, Morrill third.

Thirteenth event—Morrill first, Dickey and Snow second, Nichols third,

Fourteenth event, miss and out—Dickey first, Nichols second.

Fifteenth event, miss and out—Nye first, Nichols second.

Sixteenth event, five birds—Law first, Snow and Saunders second, Ricker third.

Seventeenth event, five balls—Law first, Symmes second, Russell third.

Eighteenth event, five balls—Russell first, Snow second, Symmes and Ricker third.

Nineteenth event, five birds—Snow first, Law second, Rockwood third.

Twentieth event, five birds—Law first, Nichols second, Russell third.

Twenty-first event, five birds—Law first, Snow second, Symmes and Ricker third.

Seventy-second event, five birds—Law first, Snow second, Russell and Nichols third.

Twenty-third event, five birds—Law first, Nichols second.

MAYNARD GUN CLUB, Maynard, Mass.—Glass-ball and clay-pigeon shoot on their grounds July 4. Representatives from many of the surrounding clubs participated in the sport.

First event, 7 clay-birds—Dickey first, Cutting second, Wurm third.

Second event, 5 clay-birds—Dickey first, Wurm second.

Third event, 5 clay-birds—Dickey and Wurm first, Nichols and Johnson second, Cutting and McCoy third.

Fourth event, 5 glass balls—Dickey and Wurm first, Cutting and Johnson second, Lawrence and McCoy third.

Fifth event, 5 glass balls—Johnson and Wurm first, Cutting and Dickey second, Nichols and McCoy third.

Sixth event, 5 clay-birds—Dickey first, Cutting second, Nichols and McCoy third.

Seventh event, 5 clay birds—Johnson and Wurm first, Dickey second, Cutting and McCoy third.

Eighth event, 5 clay-birds—Wurm first, Cutting and Johnson second Newton and McCoy third.

Ninth event, 5 glass balls—Wurm first, Cutting and Nichols second, Newton third.

Tenth event, 5 glass balls—Wurm and Dickey first, Cutting and Newton second, McCoy third.

Eleventh event, 3 pair glass balls—Dickey first, Wurm second.

Twelfth event, 5 glass balls—Dickey first, McCoy second, Wurm third.

Match between B. F, Johnson of the Maynard Gun Club and G. H. Wurm of the Massachusetts Rifle Association; conditions, 25 clay-birds, 25yds. rise.

Wurm	1111111111111111111110111—24
Johnson	1111111111111111111011110—23

G. F. CUTTING, Sec.

WINCHENDON, Mass., June 26.—At the regular meeting of the Winchendon Gun Club to-day, only clay-pigeons were thrown from the trap. This is the second time it was used. The result was as follows:

L F Martin	1111111110—10	F M Brown	1110101110—7
James Southerland	0110111111— 8	F E Monn	0011011000—4
F F Hopgood	1101101111— 8	L P Ball	0101000000—2
P S Davis	1001110111— 7		

EVANSVILLE, Ind., July 4.—The match at clay-pigeons at the Salt Well to-day was one of the most hotly contested, as well as one of the best—as far as a fine score is considered—ever shot in this State. The match was at 20 birds, 18yds., rise, ties to be shot off at three yards. The first score was as follows:

Throop	00101001101000111110—10
Gilbert	11111111110111111111—19
W Durham	01101111111111111111—18
Clifford	01111111010111111111—17
Cooper	01111111001111111111—17
E Durham	11111011111111111111—19
Lacy	11010111111101101111—16
Hallock	01111111101011111111—17
Johnston	11111111101111111111—19
Garvin	11111111111111110111—19

This gave Gilbert, Ed. Durham, Garvin and Johnston ties on 19 birds. The distance was moved three yards, and the next score at the birds resulted: Gilbert 3, Ed. Durham 3, Johnston 3, Garvin 3. The distance was then moved three yards further, and the next shoot, which proved the deciding one, was as follows: Gilbert 1, 1, 1, Ed. Durham 0, 0, 0, Johnston 0, 1, 1, Garvin 0, 1, w. This gave the match and the medal to Gilbert, who probably won the tie by having an extra shooting gun. Aside from this he broke three trial birds, i. e., birds tried to test the trap, making him a total of 28 birds broken out of a possible 29. Mr. Johnston, who was second, is deserving of especial praise in his shooting, as ill health has prevented much practicing, and his shooting in this connection was very remarkable.

CASTLEWOOD, D. T., June 27.—This evening the gun club recently organized in this city had their first shoot. Taking into consideration that a strong wind was blowing, and the fact that the majority of the club never had any experience at trap shooting the score is not a bad one: Wm. Shanks 5, E. C. Webber 1, H. Ellefson 0, A. F. Swift 5, E. L. Hills 6, R. Matson 1, A. F. Poulson 4, F. Cheever 1, F. L. Page 3, W. O. Fraser 9.

SACRAMENTO, Cal., June 22.—The Foster Gun Club held its monthly pigeon-shooting contest in Agricultural Park to-day. The birds were a fine lot, flying swiftly, and as there was a strong southerly wind prevailing nearly all were "tailers," and got out of range in short order, consequently the scores made may be considered unusually good. Several birds that were hit hard died out of bounds. Mr. Eckhardt, whose score is the lowest, was very unfortunate, hitting all his birds, but only being able to retrieve 5. He shot a light gun, using wood powder, which is slow, and by the time the shot reached the birds they were most of them too far away to be stopped inside the 80-yd. circle.

Following is the score of the main match to-day, John Gerber winning the first medal by a clean score:

Gerber, J, 21yds	111111111111—12
Gerber, W E, 21yds	111111101111—11
Todd, 26yds	111111011111—11
Miller, 21yds	110111111111—11
Watson, 21yds	101111111111—11
Stevens, 21yds	111111001111—10
McKuno, 21yds	111100111110— 9
Zuver, 21yds	100110101111— 8
Tebbets, 21yds	001110011011— 7
Eckhardt, 21yds	011000091110— 5

A match at 31yds., both barrels, followed. Watson made a clean score and took first money, and Zuver and Nesbitt divided second and third money, with a score of four each.

Several matches at clay-pigeons were shot. The score of a specimen one is appended.

Todd	111111011111—11
Watson	110110111111—10
McKune	110111001111— 9
Stevens	111011110011— 9
Chapman	111001101111— 9
Tebbets	101110111001— 8
Denny	010111010110— 7

The entrance in this match was $2.50.

INDIANA.—The Crescent City and Lamasco Gun Clubs, of Indiana, met on the 4th inst., and had a friendly match. Sides were chosen from the members present. Live birds were used and several good scores were made considering the birds were all as fresh as possible, having not been cooped up over twenty-four hours.

Capt. Halwes's Side.

H Halwes	011111000111111101—15

O B Still*	110111101100000000— 8—127

*Only shot at 10 birds.

There is a movement now on foot to have a two days' tournament at live birds at an early day and to invite all neighboring clubs. The Crescent City Gun Club are anxiously awaiting challenges, Evansville Gun Club preferred.

Canoeing.

CANOEISTS are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc, of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

July 9 to 15.—Chicago C. C., Annual Cruise.
July 14.—Allegheny C. C., Cruise at Conneaut Lake.
July 19.—Chicago C. C., First Annual Regatta.
July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 15.—A. C. A. Meet, Grindstone Island.

CRUISING CANOES IN THE A. C. A. RACES.

THE limit of sail in Race No. 10, Class B, should be 75ft. instead of 50ft., as stated June 26. The following letter from the Mohican C. C. expresses the feeling of a large number, as under the present rules the all around canoe of 14 to 15ft.x30in. is practically exclude from the races. It cannot enter Race 3 with any chance of success, as it will meet a boat built nearer to the limit, 17x28, against which it would be hopelessly handicapped. In Race 4 there will be a chance, but in favor of the heavy boats, and it would be absurd for a 14x30 boat to enter Race 7, as there will probably be a 17x28 boat or one of similar dimensions. Race 8 is out of the question, Race 9 handicaps it to the extent of 2ft. length, Race 11 and 12 will allow it to enter, but the whole system of measurements, based on a division into sailing classes and paddling classes, tends to develop special boats for each class, to the exclusion of the all around boat. We would call the attention of the Regatta Committee to this fact, as the great majority of canoe owners are directly interested. Mixed races will tend, to a certain extent, to encourage the all around boat, and a plan is now under consideration to attain the same end.

Editor Forest and Stream:

At a regular meeting of the Mohican C. C. of Albany, N. Y., held July 2, 1884, Gen. R. S. Oliver offered the following resolutions, which were unanimously adopted:

Whereas, It appears from the published list of races to be held at the A. C. A. meet for 1884 in Eel Bay, that no race has been provided for Class B without ballast and without heavy centerboard;

Whereas, The majority of canoes in this club and many others in inland waters are of Class B without heavy centerboards, and are usually sailed without ballast;

Resolved, That we respectfully request the Regatta Committee to place upon the programme of the meet a sailing race for canoes of Class B, without ballast and without heavy centerboard;

Resolved, That a copy of this resolution be sent to the Commodore of the A. C. A., to the Regatta Committee, to the editors of FOREST AND STREAM and of the *Canoeist*;

Resolved, also, That should such a race be placed upon the programme, the Mohican C. C. will contribute a flag as first prize in such a race, if the Regatta Committee desire it.

B. FERNOW, Sec'y M. C. C. ROBERT W. GIBSON, Captain M. C. C.

Editor Forest and Stream:

The official programme of races—A. C. A. Meet of 1884, regatta committee report—is before me. There are two points I notice about it—faults I might say—which could be easily amended. First, the average cruising canoe is systematically neglected, the very one the Association should encourage in every way possible. It is handicapped in every event on the list with perhaps three exceptions, viz.: No. 10, limited ballast race; No. 11, sailing and paddling race, and No. 12, the light race. In these races its chances are slim with other boats built up to the limits.

Second, there is no inducement offered to the canoeist of average ability to enter any race. He naturally feels that his chance of getting a first or second prize is too small to pay for the exertion necessary to win such a place. This has been the fault of every programme offered at any meet thus far. Without changing a letter of the document as it now stands, I would suggest to the committee of three that they add two prizes to their already long list. The first to be given to the canoe making the best average in all the races. The second for the next best canoe. Also that the record of every canoe entering any race be taken (with three events omitted to be named later), and after the races this record to give the exact position to every canoe having taken part. The same to be published with the other results. The canoe with the best average to be classed No. 1, the next best No. 2, and so on down the list. If twenty canoes take part in the races they will be numbered from one to twenty on the record, according to their deserts.

This record will be very simple to make up and of great interest to all. The canoeists entering the races will do their best to get good places at the finish, not only for the individual race prizes but also for the average prize and for the place on the record. A man may be low on the record but ahead of any other one of his club's members. This record will also show the club having the highest average, a very desirable thing. An average 14ft.x30in. canoe will be on a par with a canoe built to the full sailing or paddling limit if, for instance, it gets two third places in two races to the other's first place (sailing) and fifth (paddling)—average for both is six.

Now for the method: Suppose there to be thirteen events, and that ten canoes enter in one of them, the other races all having less than that number. The maximum number of points will then be 10×13, or 130 points. The first canoe in each race (no matter how many enter it) will receive 10 points, the second 9, the third 8 and so on, a canoe not entered or not finishing to get nothing. Of the thirteen events one canoe can enter, perhaps, eight, and if it wins them all will receive 80 points. The canoe securing the most points, all told, to be No. 1 on the record. In case of a tie at, say ten, then two canoes would be numbered 10 and 11 would be dropped. The clubs could also be numbered in the same way, and it would foster patriotism among members to push the club record up as high as possible, thus securing more entries for the races.

The thirteen events are accounted for thus: No. 2 on official programme to be omitted in the averaging—it being a limited novices race. No. 4 is really two events, A and B sailing; No. 10 is also, for the same reason. Nos. 13 and 14 should be omitted. By this arrangement—which I hope to see made a permanent feature—the canoe in any class, built up to the limit, sailing or paddling, stands a very poor show of getting first place—and the canoe built and used for all around work will be pretty sure of getting a good place with fair management. Such a record will also help the novice to select his canoe with an eye to the "average," the true canoer's aim being the "happy medium." What have you to add, Mr. Editor—something, I hope. DOT.

THE A. C. A. MEET.

To the Members of the American Canoe Association:

The site chosen for the 1884 camp of the A. C. A. (Aug. 1 to 15) is on the northeast end of Grindstone Island, distant about four miles from Clayton, N. Y., and five miles from Gananoque, Canada, just south of the boundary line, and facing Canada on the north and Eel Bay on the northeast. The grove in which the tents will be pitched is on the north side of the point, on a rather sharp slope, with a stony shore, but the shore on the northeast side is a gently sloping one, with a sandy beach.

Arrangements have been made at the camp so that those who desire to do so may get their meals at a regular mess, at which meals will be served at reasonable prices. There will also be a camp store established, at which campers may obtain groceries, provisions, etc., at Clayton prices. Milk, eggs, vegetables, fresh meats, etc., can also be obtained at the store. Ice, which has been stored for the use of the Association, will be brought into the camp every morning. Wood in abundance, both for camp fires and cooking purposes, has been provided.

The palatial steamer Puritan, connecting with the Utica and Black River Railroad at Clayton, and with the Grand Trunk Railroad at Gananoque, will land members at the camp wharf, arrangements having been made, by which, during the encampment, she will include the camp in her regular stops. This steamer will carry canoes and kits free. The regular fare (25 cents) will be charged. No other steamer but the Puritan will be allowed to land at the camp wharf without a permit from the officer in command of the camp at that time.

The following railroad and steamboat lines in the United States have agreed to carry canoes and kits free, at owners' risk, but in all cases members must go on same train or boat with their canoes: New York Central & Hudson River, New York, Ontario & Western to Oswego, thence steamer Ontario to Clayton; Utica & Black River Railroad, Delaware & Hudson Canal Company's Railroad; Ogdensburgh & Lake Champlain Railroad, and the Lake Champlain Transportation Company (steamers on Lakes George and Champlain).

The Canadian Southern Pacific Railway will issue excursion tickets at one and a third regular rates. Tickets one way will be at regular rates. The Grand Trunk Railroad will also issue excursion tickets at the same rate; regular tickets one way. The Ontario Division of the Canada Pacific Railway offers excursion tickets at same rates as those above. The Northern & Northwestern Railway will charge one fare for excursion tickets. The Richelieu & Ontario Navigation Company will also sell round-trip tickets at one fare. All these railways and steamers will carry canoes and kits free of charge, but at owners' risk of loss or damage.

Members coming from the South via Jersey City, etc., wishing to ship their canoes by express to the camp, have an opportunity of doing so via the National Express Co., which operates over the line of the New York, Ontario & Western Railroad, and connects with the Adams Express Co. at Union Depot in Jersey City.

All mail matter intended for the camp should be addressed A. C. A. Camp, Clayton, N. Y. Arrangements will be made to have it forwarded direct to the camp. The address of the secretary of the Association will be Clayton, N. Y., after July 15.

CHAS. A. NEIDÉ, Secretary A. C. A.

SCHUYLERVILLE, N. Y., July 2, 1884.

THE A. C. A. BADGE.

Editor Forest and Stream:

I have appointed as a committee on the A. C. A. badge question the following gentlemen:

Wm. B. Wackerhagen, M. C. C., 41 State street, Albany, N. Y., Chairman.

Dr. George L. Parmele, H. C. C., Hartford, Conn.

James L. Greenleaf, K. C. C., New York City.

Months ago I requested the members of the A. C. A. through the *American Canoeist* to send in designs for this badge, or to suggest designs that I might work out and present to the committee, thus giving them valuable assistance in the selection of the badge. The result was the reception of designs from three members of the A. C. A. One of two things appears as almost a certainty. Either the *Canoeist* reaches only a few A. C. A. men, or else very few A. C. A. members are at all interested in the badge question. Once more I will express my desire that designs be sent to Chairman Wackerhagen at the earliest moment possible in order to have the committee report at our annual meeting. Respectfully, yours,

F. A. DICKERSON, Com. A. C. A.

SPRINGFIELD, Mass., July 8, 1884.

[The subject of a badge for members of the American Canoe Association has been under consideration ever since the local meet; and as yet little has been accomplished, as will be seen from the above letter of Commodore Nickerson. It is a matter in which all canoeists are interested, and it remains for them to assist the committee in their labors. If every club will but send a design, there will be no lack of material to work on at the meet. "What is everybody's business is nobody's business," and each individual member is apt to neglect his part, but in such matters, the Commodores of the different clubs must take the lead, and if each will do so, he can readily obtain one design on behalf of his club; but the time is now very short, and what is done, must be done speedily.]

RONDOUT C. C. CAMP.

THE Rondout Canoe Club enjoyed a very pleasant outing on July 4th at their camp on Esopus Island, situated a few miles below Rondout, half a mile long, and a most beautiful spot for a camp. Camp was made on Thursday night, canoeists from Newburg and other places joining the R. C. C.

The next morning nearly a hundred guests of the club, many of them ladies, came down on the little steamer W. B. Crane, chartered for their use by the club. Two cooks from Rondout were an board to look after the dinner, which included 10 gallons of clam chowder, 1000 baked clams, and unlimited ice cream.

The following races came off in the afternoon at 3 P. M., the final one, a tub race, being omitted, as the water was too rough for such frail craft, a swimming race, won by C. V. A. Decker, being substituted.

Firt Race, Paddling.—Entries: Grant Van Deusen, Helena; N. S. Smith, Pixie; C. V. A. Decker, Glance; C. W. Crispell, Zephyr; Conrad E. Hasbrouck, Crazy. Prizes.—Flrt, canoe lantern; second, flag. Result.—N. S. Smith, first; C. W. Crispell, second; Grant Van Deusen, third.

Second Race, Sailing.—Entries: Grant Edger, Dido; Grant Van Deusen, Helena; Jansen Hasbrouk, Jr., Crazy. Prizes.—First, canoe chair; second, flag. Result.—Grant Van Deusen, first; Grant Edger, second.

Third Race, Paddling Tandem.—Entries: Messrs. D. Vaux and N. S. Smith, Dido; Grant Van Deusen and H. S. Crispell, Chum; C. V. A.

Decker and J. Hasbrouck, Jr., Janet. Result.—Dido, first; Chum, second.

The latter portion of the programme was interrupted by the usual Fourth of July storm, which drove all to the boats and hurried them home.

The Rondout C. C. seem to be able to have a good time on less provocation than any canoe club we know of, and from what we hear of their doings the members are much to be envied.

BAYONNE C. C.

THIS club, which started in a small way two years ago is now quite flourishing, the members being all enthusiastic canoeists and hard workers, having built their own house and many of their canoes. Their house is now too small to hold all the boats, and they expect to enlarge it soon. Newark Bay is a fine place for canoe sailing, there being but little traffic, and the tides, though strong, being much better than in New York Bay or the Kills, while there is an excellent beach on the east shore.

The first regatta of the club was held on July 4, there being four races on the programme. In spite of the unpleasant weather the club and their friends enjoyed the sport

The first event was a paddling race with seven entries, distance one mile with a turn. Won by F. B. Collius, with T. Garrett second and A. T. Fleming third.

The sailing race, three miles, triangular course, was not finished, as the mark could not be found in the fog. The double paddling race brought out four canoes, the distance being one mile with turn, and was won by A. Fleming and R. Vienot, by five lengths, with F. B. and J. L. Collins second. The last race, an upset, was won by Com. Smith, with L. F. Burke second, there being five entries.

MOHICAN C. C.

THE Mohicans have lately increased their membership to twenty-eight canoeists and eighteen canoes, and numbers of them may be daily seen on the river. Last Saturday, June 28, a championship badge and flag, offered by Capt. Gibson, was sailed for in a race of about three miles, and won by a new member, Geo. H. Thacher, Jr., in the Lasca, a Rushton Ellard; the Thetis, P. M. Wackerhagen, came in second, and the Uncas, H. R. Pierson, Jr., third, no other canoes participating. Mr. Thacher will have to defend his prize in a race on the 26th of July.

Gen. Oliver offered a silver cup as prize to be sailed for by canoes of any class, sail limited to 60ft., but the Executive Committee has not yet taken any action about it.

At the regular meeting of the club, held to-day, several resolutions were adopted, viz.: That if the official programme of the A. C. A. meet is not amended to include a sailing race for canoes of B class, without leavy centerboard, the M. C. C. will offer a flag, value $10, as first prize for such a race in Eel Bay; and that in races of the M. C. C., canoes with centerboards weighing more than fifteen pounds should not be admitted.

Nine Mohicans talk now of going to the Thousand Islands, but it is not quite sure whether the club will be so well represented.

FIOR DA LICE.

ROYAL C. C.—The race of Saturday, June 14, was sailed in Teddington Reach, with three entries, Imogen, H. Church; Gladys, T. F. Knowles; Violet, W. Watney. There were four rounds to the course, the wind being W. N. W. The times were as follows:

	First Round.	Second Round.	Third Round.	Finish.
Violet	3 55 00	4 15 00	4 36 00	4 56 30
Imogen	3 53 00	4 14 00	4 36 30	4 57 30
Gladys	3 55 30	4 16 00	4 36 30	4 56 00

CRUISING NOTES.—Dr. Neidé and Mr. J. F. Newman, N. Y. C. C., started on a long cruise on July 3, leaving Caldwell at noon, Lorna Island at 9 A. M. on the 4th, Cook's Point 7 A. M. July 5, Ticonderoga 2 P. M. same day, and making camp near Crown Point that night in a heavy blow and rainstorm. The weather was very variable, dead calm or very hot, wind light and squally or blowing very hard. The canoeists expect to be at Grindstone Island by July 20, or perhaps earlier. Mr. Alden is off again on his usual cruise down the Richelieu.

A NEW CANOE CLEAT.—We have received from Mr. Tyson two cleats of a new pattern, designed by Mr. E. B. Tredwen, R. C. C. They are in one piece, light but very long, being 4in. and 6½in., and are so shaped that the cord jams between them and the deck, and are recommended as superior to Paget's rocking cleat, while much cheaper.

ATALANTIS.—Mr. Stoddart, L. G. C. C., resumed his cruise this week around the coast, in company with Mr. R. B. Burchard, N. Y. C. C. They were at Wood's Hole on July 6, stormbound, but arrived at Hyannis at 6 P. M. on the 7th, leaving next morning.

NEW YORK C. C.—The club will meet on Saturday, July 12, at 3 P. M., at the club house, for a series of scrub races for practice. The programme will be decided on meeting. A janitor is now employed regularly by the club.

Yachting.

HULL Y. C. REVIEW AND CRUISE.

SHORT cruises in company are becoming more popular with our yachts each year, and this season a better opportunity than usual is offered, as the 4th and 5th of July, as well as the 30th and 31st of May were both generally observed as holidays, giving a chance for three days away from business. About New York, the Knickerbocker and Jersey City Y. C., and in Philadelphia, the Quaker City Y. C., have taken advantage of the three holidays for their club cruises, and in Boston, the Hull Y. C. has called together all who cared to neglect the races for cruising. The programme called for a review of the fleet in the morning, the start for the cruise following.

Friday morning broke with a promise of a storm, but by 8 A. M., a breeze from the southwest changed the appearance of things, bringing sunlight and every prospect of a fine sail, which was fulfilled by 10 A. M., by which time the Brenda, with Commodore C. A. Perkins on board, signaled for the fleet to pass in review. The Vif, Vice-Commodore William H. Crane, led the fleet out into Nantasket Bay, then in with a free sheet, heaving up under the stern of the Brenda, and firing a gun to leeward, which was answered by one on the flagship, each yacht saluting in turn until all had passed, when they hove to and waited for the Brenda to get under way. At 11 A. M., the signal to make sail was hoisted, Brenda having taken her position at the head of the fleet, passed on through Hull Gut, followed by the schooner Titana, ex-Commodore William Wells; yawl White Cap, Rear-Commodore D. Hall Rice, Vice-Commodore William Crane; schooner Alice, Captain William Lockhart; schooner Tempest, Captain Whittier; sloops Hera, Captain Weld; Echo, Captain Farrell; Nimbus, Captain Jenney; Gem, Captain Osgood; cutters, Sigdriffa, Captain Monks and Ella May, Fleet Captain George Tyler, and other sailing and steam yachts. At 2 P. M. the fleet anchored in Marblehead Harbor.

BOSTON CITY MATCHES, JULY 4.

THE city matches on July 4 brought out nearly one hundred yachts of all kinds and sizes, from Maggie, the stylish cutter of 44½ft., to little Shrimp of 13ft. The wind was very light in the morning, but came out fresher from the east, and held there through the race.

The courses sailed were for first class (sloops and schooners of over 38ft.), from the judges' boat out Broad Sound, leaving Ram Head buoy on the starboard and Egg Bar buoys on the port, rounding Fog Whistle off the northeast ledge of the Graves, leaving it on the starboard; thence to the bell boat on Harding's Ledge, leaving it on the starboard, up Lighthouse Channel, through the Narrows, leaving Fort Warren, Gallop's Island and Nix's Mate buoys and Spectacle Island on the port, to the judges' boat, passing between it and the flagboat, a distance of twenty miles. For Class 2 (sloops and schooners 25 to 38ft.), from the judges' boat down the West Way, leaving Thompson and Rainsford islands on the starboard, Long and George's islands and Point Alderton buoy No. 3 on the port, and back through the Narrows, leaving Fort Warren, Gallop's Island and Nix's Mate buoys on the port, to the judges' boat, passing between it and the flagboat, a distance of fourteen miles. For Class 3 (for keels and centerboards 20 to 26ft.), from the judges' boat round a flagboat moored off Cow Pasture Bar, near the pumping station, leaving it on the port; thence to buoy No. 7, off Fort Independence, leaving it on the starboard; thence to Sculpin Ledge buoy, leaving it on the port; thence to buoy No. 6 on Lower Middle, leaving it on the port, to the judges' boat, passing between it and the flagboat, a distance of eight miles. For Class 4 (keels and centerboards), from the judges' boat to buoy No. 9, leaving it on the starboard; leaving buoy No. 7, off Fort Independence, on the starboard, buoy No. 6 (Cow Pasture Bar) on the starboard, passing between the judges' boat and flagboat, a distance of five miles.

Messrs. Morton, Whittier, Nugent, Lappen, Farrar, Bigelow and Brigham, of the City Council, had charge of the arrangements, the judges being Messrs. Riley, Morris, Loring, Palmer, Melvin and Guild. The tug Wesley A. Gove carried the judges over the course, but it was impossible to see all of the boats on their different courses.

At 10:30 the starting signal was given, the fleet getting away in good order. No time was taken at the various marks, but by noon, when the judges' tug returned to the starting point, Joker was not far away, the first home, the rest coming in in groups.

To time such a fleet was no easy matter, but it was finally accomplished, and the times computed as follows:

FIRST CLASS—SLOOPS.

Name and Owner.	Length.	Actual.	Corrected.
Maggie, George H. Warren	44.06	4 20 56	4 20 55
Nirvana, S. P. Freeman	41.06	4 43 30	4 39 20
SECOND CLASS—CENTERBOARDS.			
Shadow, John Bryant	33.06	2 46 30	2 42 12
Magic, E. C. Neale	30.02	2 53 12	2 45 13
Nimbus, B. Jenny	33.03	2 53 20	2 48 48
Tri, Henry Tudor	33.00	3 10 44	3 05 55
SECOND CLASS (KEELS).			
Hera, C. G. Weld	35.00	2 50 27	2 47 40
Lapwing, M. Forbes	36.00.	2 51 04	2 49 15
Ægis, William McCormick	34 00	2 53 13	2 49 26
Lillie, John P. Gale	36.02	3 00 00	2 58 22
King Philip, C. G. Weld	35.06	3 03 46	3 01 29
Percy H., Albert Hall	32.06	3 08 13	3 02 52
Altaire, J. L. Crowley	28.08	3 26 29	3 16 40
SECOND CLASS (SCHOONERS).			
Bessie, C. P. Curtis	27.02	3 33 50	3 33 50
THIRD CLASS CENTERBOARDS.			
Black Cloud, Brown & Cunningham	22.00	1 34 12	1 30 29

A misunderstanding of the whistles gave grounds for several protests.

KNICKERBOCKER Y. C. ANNUAL CRUISE.

IN obedience to orders from the flagship Sara, Commodore Hobby, the following yachts made sail at 4 P. M., off the club house, July 3; Sara, Gipsy, Lizzie R., Reverie and Gil Blas. The wind was light, and the yachts did not reach Echo Bay, the rendezvous, till late in the afternoon. At 8 P. M., the rest of the fleet were towed up by a tug chartered for the occasion, and under command of the club's busy secretary, W. R. Morse. This fleet consisted of yachts Gracie, Mayotta, Whimbrel, Maggie, Rosetta A, Adele, Mystery, Peerless, Sea Robin, Reckless and Waconda. They reached Echo Bay at 11:30 P. M., and were warmly received by the yachts which had preceded them.

At 8 A. M., July 4, a meeting was held on board the Sara, and the captains agreed to proceed to Larchmont, see the start of the Larchmont Y. C. regatta, and then make the anchorage off the Indian Harbor Hotel, Greenwich. The weather was threatening from the S.E., and by noon it blew "great guns" and heavy rain commenced to fall. When off Larchmont, Sara stowed large jib and set her storm jib, reefed mainsail and kept off for Greenwich, not waiting to see the race start. Some of the yachts followed her, but the fleet became somewhat scattered owing to the heavy weather. Lurline hauled her wind for Cow Bay, and Gipsy and Gracie ran for Milford.

However before nightfall most of the yachts reached the anchorage agreed upon. The crews of the small boats, after dressing in oil skins and rubber boots, retired to somewhat moist sleeping accommodations. Waconda reached Indian Harbor first, with Sara second.

At six bells the next morning the fleet started for Oyster Bay in the face of the easterly gale and heavy rain. Sara reached Oyster Bay first. Peerless was struck by a heavy squall when in the middle of Sound and was blown to Bridgeport before she was able to spread any canvas. Maggie, a wee catboat under command of Capt. Gus Wagner, was pluckily handled and went the rounds with the fleet.

On Sunday A. M., the fleet left Oyster Bay homeward bound, and arrived during the late afternoon and evening. At the start the Knickerbockers were joined by yachts from the East River, Yonkers, Harlem and Newark yacht clubs. That the cruise was brought to a successful termination reflects considerable credit on the seamanship of the members of the Knickerbocker. Three worse days as to wind and weather it would be hard to select from an entire yachting season.

ATLANTIC Y. C. CRUISE.

FLEET Captain R. C. Field has issued the following orders of Commodore H. H. Hogins, regarding the annual cruise of the Atlantic Y. C.:

GENERAL ORDERS NO. 4.

FLAGSHIP AGNES, July 7, 1884.

1. The rendezvous of the fleet of the Atlantic Y. C., for its annual cruise, will be on Saturday, July 26, at the harbor of Norwalk Islands, and off Wilson Point.

Members and guests desiring to join their yachts at the latest moment can take steamboat leaving New York, pier No. 27 East River, at a quarter to 3 P. M., or Thirty-first street at 3 P. M., or train at 4 P. M. from Grand Central Depot, connecting with Danbury and Norwalk Railroad, at Norwalk, for Wilson Point. The facilities of this place as a rendezvous are represented as complete, particularly in the matter of railway, steamboat and telegraph communication and dock accommodation.

2. On a signal from flagship, after arrival of train and boat, the fleet will sail for Black Rock.

3. On Sunday, July 27, service will be held on a yacht of the fleet to be hereafter designated. At half-past ten A. M. a gun will be fired from the flagship, when the service signal will be hoisted on the yacht on which service will be held at eleven o'clock. General attendance is desired, and captains are requested to have their gigs ashore to convey such shore guests as may desire to attend.

4. There will be two divisions of the fleet during the cruise, classes A, B, C and D comprising the first and all other classes the second division, and the signal for starting will be habitually as follows:

First gun from flagship to prepare to sail. Ten minutes later—

Second gun from yacht Nomad, Rear Commodore Wintringham, for the second division to start. Ten minutes later—

Third gun from yacht Enterprise, Vice-Commodore Moffat, for first division to start.

5. On due signals the fleet will proceed as follows:

On Monday, July 28, to New London; on Tuesday, July 29, to Greenport; on Wednesday, July 30, to Stonington; on Thursday, July 31, to Newport; on Friday, Aug. 1, to New Bedford.

At New Bedford (or earlier, further or final orders will be issued.

6. Any Captain in second division desiring to make the start for New London prior to the regular start will be permitted to do so on application to the Commodore.

Attention is called to the fact that, with the exception of the run of July 28, the cruise has been so arranged as to make it feasible for the smaller cabin yachts of the club, and to avoid, as far as possible, the very early start heretofore necessary. It is greatly desired, therefore, that the fleet of such yachts will be large.

7. These daily runs will to an extent be trials of speed, and the first yacht arriving at the destined port will take its own time of arrival and that of the other yachts of the fleet, selecting, if possible, a point for turning that will be equitable and fair to all, and report the result to the commodore.

8. Yachts should be provided with red fire or Roman candles for use in case of fleet sailing at night.

9. These orders are subject to alteration or modification as occasion may require.

LYNN OPEN MATCHES, JULY 4.

THE open matches of Friday last were the first held since 1880, but they were so successful that it is to be hoped they will be held every year. The entries numbered 41, of which 33 went over the course, the boats being from 13 to 27ft. in length. The course for the first, second and special classes was from club house to a flagboat off Point Shirley, leaving it on port, thence to western Lobster Rocks buoy, leaving it on port, thence to judges' boat, a distance of 5 miles; that for class three being from the club house to a flagboot off Pines Point, leaving it on port, thence to Sand Point buoy, leaving it on port, thence to judges' boat, 3 miles. The boats were divided as follows: Class 1, 20ft. and not over 27ft.; class 2, centreboards, 17ft and not over 21ft.; special class, keels, 17ft. and not over 20ft.; third class, 12ft. and not over 17ft. The prices were, first class, $25, $15, $10, $5; second class, $20, $15, $10, $5; special class, $20, $15, $5; third class, $15, $10, $7, $5. The judges were Messrs. W. B. Newhall and B. W. Rowell.

The wind came from the east at 8 o'clock, freshing up sufficiently to make a good race throughout. The following table gives the full times of the classes.

FIRST CLASS.

Name and Owner.	Length.	Actual.	Corrected.
D. Crockett, H. Putnam	20.11	1 42 00	1 23 57
Pearl, J. F. Lee	22.04	2 03 30	1 45 53
Viola, E. C. Smith	20 00	1 41 00	1 21 44
Edith, J Davis	26.11	2 10 25	1 55 22
Jennie L., C. H. Lockhart	23.11	1 43 21	1 26 42
Daisy, W. Hawkes	22.09	2 17 45	2 00 08
Jantho, J. Cole	20.08	2 15 15	1 56 31
Nora, J. McLaughlin	21.08	2 24 20	2 06 17
Nellie J., M. Lake	21.00	2 10 20	1 51 50
SPECIAL CLASS.			
Annie, G. Parker	17.00	2 52 45	2 31 50
Vesper, Benner Bros	18.09	1 58 45	1 38 35
Inez, Goodridge Bros	18 09	2 00 10	1 40 00
Iris, Guilford Bros	17.00	2 14 05	1 52 25
SECOND CLASS.			
Georgie, F. E. Newhall	17.06	2 23 05	2 02 45
Daisy D., W. Martin	18.06	2 21 00	2 00 34
Twilight, A. K. Hall	18.01	1 56 00	1 35 17
Raven, F. Steinbeck	18.01	2 17 45	1 57 02
Alice L., P. Lynch	17.03	2 14 10	1 52 43
Rattlesnake, W. H. Alley	19.00	1 53 15	1 33 17
THIRD CLASS.			
Mabel, F. W. Sawyer	15.04	1 29 00	1 15 01
Imp, J. Renton	13.02	1 38 10	1 22 40
Florence, —. Mansfield	16.10	Ruled out.	
Crescent, T. M. Alley	16.07	1 13 15	1 00 01
Wizard, J. Bertram	13.00	1 28 15	1 12 37
Elsie, C. F. Hardwick	16.04	1 21 00	1 08 30
Flirt, F. H. Hildreth	15.08	1 14 00	1 00 13
A. B. C., —. Mansfield	Ruled out.		
Spray, G. F. Putnam	14.00	1 21 15	1 02 22
Ida A., Rideout Brothers	14.00	1 31 55	1 17 02

The following prizes were awarded: First class—Viola, first, $15; Davy Crockett, second, $15; Jennie L., third, $10; Pearl, fourth, $5. Second class—Rattlesnake, first, $20; Twilight, second, $15; Alice L., third, $10; Raven, fourth, $5. Special class—Vesper, first, $20; Inez, second, $15; Iris, third, $5. Third class—Crescent, first, $15; Flirt, second, $10; Spray, third, $7; Elsie, fourth, $5.

LARCHMONT Y. C. ANNUAL MATCHES.

A FRESH northeast wind made plenty of work for the sailor men of the Larchmont Y. C., in their fifth annual matches, on Friday last, while the day was cool enough to make it pleasant for the spectators, and excepting the rain squalls in the afternoon, the weather was all that they could desire, a strong wind from one quarter all day, and not enough sea to bother even the little fellows.

The club is better situated than any other about New York, having a good anchorage, plenty of water for sailing, and in addition, handsome grounds and club house close to the anchorage, many of the members having cottages near by, while some of the bachelors live in the club house. Although comparatively a new organization the club numbers over 300 members with 114 yachts. Shifting ballast is still permitted on the open boats, of which there are 50 on the club list, but the crews are limited to one man for 5ft. length, the latter being taken as the waterline plus ⅛ of overhang, the time allowanced being estimated on the same basis.

The 24 entries included 6 classes; class C, sloops, cutters or yawls of 55ft. sailing length, or over; class 1, the same of 42ft. and under 55ft.; class 2, 30ft. and under 42ft.; class 3, under 30ft.; class 4, open jib and mainsail boats of 23ft., or over; class 5, the same of under 23ft.; class 6, catboats of 23ft., or over; class 7, the same under 23ft. The prizes were, classes C, 1 and 2, each, $75.00; class 3, $60.00; classes 4 and 5, $50.00; classes 6 and 7, $35.00 each, besides the "Connor Cup" for class C; value, $750.00, and the "Gould Cup," classes 1 and 2, value, $550.00.

The courses were, for classes one and two, from off Pagoda Point, Larchmont, to and around red buoy off Execution Reef, thence to and around buoy off Matinnicock Point, to and around a stakeboat off Captain's Island, around Execution buoy again to the starting point, 22 miles. The smaller classes, after rounding Matinnicock, going to the black buoy off Constable Point, and thence home by way of Execution Point, making 17 miles.

The steamer Belle Horton came down from the city about 10 A. M. with a large party of ladies and gentlemen on board, and after taking on another party at the Horseshoe, steamed over the starting line, where the tug W. Goodwin with the judges, Messrs. W. H. Jenkins, J. Lester Wallack and T. R. Fisher, and reporters, was lying.

Of the twenty-four yachts entered, but eighteen were to windward of the line ready to start, their names being as follows:

CLASS 1.

Name.	Owner.	Length.
Athlon	J. C. Barron, M. D.	54.08
Eclipse	E. H. Wales	50.08
Fanita	George J. Gould	47.05
CLASS 2.		
Crocodile	J. G. Prague	41.02
Schemer	Commodore Monroe	37.03
CLASS 3.		
Yolande	C. A. Stevenson	28.03
Varuna	Edgar S. Turton	27.03½
Amazon	Franklin Beams	26.08
Kathleen	G. R. Barreto	25.11
Gannet	Oliver Adams	21.02
CLASS 4.		
Florence	D. H. Jardine	28.00
Meteor	S. Wainwright	26.06
Cheemaun	W. I. Van Wart	24.10
CLASS 5.		
Zoe	H. A. Sanderson	22.08
Nymph	F. W. Flint	21.09
G. B. Dean	T. W. Whittemore	21.05
CLASS 6.		
Cruiser	A. Bryan Alley	20.09
Jewel	Thomas Mott	19 08

Ileen was entered but was not present. Fanny and Oriva were both sailing about, but not in the race, while Comet, Columbia, Natalie, Princess, Nokomis, and the little launch Sindbad were also on hand.

At 11:21 A. M., the first signal was given by whistle and flag, as stated in the printed instructions, and at 11:26 the second followed, but the yachts, well up to windward in Larchmont Harbor, paid no attention to them. When the time was up but 5 had crossed, and the Sindbad was sent with a roving commission to hurry the loiterers over, but it was not until 11:51:37 that the last one crossed. The fault

certainly did not rest with the Regatta Committee, as the signals were all worked properly, but the whole start was a bungling affair.

Meteor was first over, hauling in her sheet as she crossed. Zoe came next, her crew busy with the bags, as the blocks came together, and she headed for Execution with wind abaft the beam. Then came Fairy with a still larger pile of bags. Cruiser came down, but stopped to reef. Florence, jibing as she crossed, and then came up, rounded the judges' tug, and crossed a second time, jibing again. Then Cruiser, with her reef tied on, by which time the big ones were ready, and Schemer went over with full jib and mainsail and working topsail; then Chemaun and Varuna under jib, main and topsail; Amazon with the same; Crocodile, Athlon and Fanita with jibtopsails set; Eclipse, showing a bright green bottom and red stripe at water line; Yolande, with big square header; Gannet and, last, Kathleen, each hauling in sheets as they rounded. The times of starting were:

Meteor	11 26 33	Amazon	11 45 47
Zoe	11 30 12	Crocodile	11 46 20
Fairy	11 30 35	Fanita	14 46 55
Florence	11 34 18	Jewel	11 48 15
Nymph	11 35 55	Athlon	11 48 36
Cruiser	11 37 23	Eclipse	11 49 05
G. B. Deane	11 38 40	Yolande	11 51 04
Schemer	11 39 40	Gannet	11 51 13
Cheemaun	11 41 39	Kathleen	11 51 37
Varuna	11 45 03		

The run to Execution was made so quickly by the leaders that it was too late to time them when the tug left the start, but the order was nearly the same as at starting. Down to Matinnicock was a beat, long legs on port tack and short on starboard, scattering the boats and changing positions, Schemer and Fanita taking the lead, the little ones doing well, though their crews were soaked. Off Glen Cove the tug sighted a sailboat capsized with a man on her, and another one swimming near by, but two yachts were already trying to rescue them. Yolande, having taken in her club topsail, was now beating to windward with her topmast on end.

At 12:15 a squall of rain struck the boats, returning at intervals throughout the day. Fanita was first at the buoy, luffing around and standing over for Captain's Island on starboard tack, Schemer soon following. Zoe and Fairy had been having a sharp tussle all the way down, and now, just as big Athlon luffed round, they passed through her lee, easing sheet for Constable Point, the bags flying at a lively gait to windward. Meteor, now astern, nearly fouled the buoy, and Yolande was hindered by a clumsy working schooner. Athlon and Varuna both set jibtopsails at the buoy.

The times were:

Fanita	1 13 00	Chemaun	1 26 41
Schemer	1 16 45	G. B. Dean	1 40 15
Zoe	1 17 05	Cruiser	1 44 59
Athlon	1 17 45	Jewel	1 48 39
Fairy	1 18 00	Varuna	1 55 08
Eclipse	1 21 42	Amazon	1 56 02
Crocodile	1 24 28	Yolande	1 57 14
Meteor	1 26 00		

The four miles to Captain's Island were soon made, the positions being the same, except that Schemer was fourth instead of second, as below:

Fanita	1 36 00	Schemer	1 45 00
Athlon	1 40 30	Crocodile	1 48 00
Eclipse	1 43 00		

The fight was lost to view in a heavy rain squall, but all the boats were doing their best though invisible, the big ones hurrying under spinnakers to Execution, and the little ones when passed by the tug still bravely at it. No time was taken at Execution, the tug hurrying home for the finish.

By this time the wind was hauling to the south, helping all home rapidly, Fanita being first in. In spite of the blunders at starting, the boats were curiously grouped together, Athlon, Fanita and Eclipse coming in close, Crocodile and Schemer, Yolande, Amazon and Varuna, Zoe and Fairy.

The times of the race were as follows, the actual times of start and finish and time over the course being given, while the official time taken from the gunfire is given in the fourth column.

	Start.	Finish.	Actual.	Official.
CLASS 1—CABIN SLOOPS.				
Athlon	11 48 36	3 03 10	3 14 34	3 27 10
Eclipse	11 49 05	3 04 47	3 15 42	3 26 45
Fanita	11 46 55	3 02 45	3 15 50	3 21 39
CLASS 2—CABIN SLOOPS.				
Crocodile	11 46 20	3 13 20	3 27 00	3 37 20
Schemer	11 30 40	3 15 27	3 25 47	3 35 32
CLASS 3—CABIN SLOOPS AND CUTTERS.				
Yolande	11 51 04	3 36 57	3 45 53	4 00 57
Varuna	11 45 03	3 35 08	3 50 05	3 57 48
Amazon	11 45 47	3 35 37	3 49 50	3 57 38
Kathleen	11 51 37	Did not go the course.		
Gannet	11 51 13	Did not go the course.		
CLASS 4—OPEN JIB AND MAINSAIL.				
Florence	11 34 18	Did not go the course.		
Meteor	11 26 33	3 05 16	3 38 43	3 38 36
Cheemaun	11 41 39	2 56 47	3 15 08	3 18 32
CLASS 5—OPEN JIB AND MAINSAIL.				
Zoe	11 30 12	2 54 53	3 24 41	3 24 41
Nymph	11 35 55	3 18 45	3 42 50	3 41 21
Fairy	11 30 59	2 54 58	3 23 59	3 22 27
G. B. Dean	11 38 40	3 18 25	3 39 45	3 40 16
CLASS 6—CAT RIGGED.				
Cruiser	11 37 23	3 27 52	3 50 29	3 51 52
Jewell	11 48 15	3 28 57	3 40 42	3 50 09

The success of the races is largely due to the regatta committee, Messrs. Charles E. Jenkins, Thomas B. Brown and J. B. Miley, who had charge of all the arrangements.

BEVERLY Y. C.

THE eighty-fourth regatta, being an open catboat sweepstakes, was sailed at Monument Beach July 4. A large entry of local boats not belonging to the club was expected, but they held aloof till after the entries closed, being afraid of the new Surprise, built this spring by Mr. Hanley. This boat had never been measured, it was known that she was very near the line between first and second classes, and she frightened all but the B. Y. C. boats and one boat from Chatham out of both classes When she was measured on the morning of the 4th and found to be in first class by four-fifths of an inch, the local second class boats wanted to enter, but it was too late.

At the time of the start, the wind at the judges' yacht was brisk N. E., but some two miles down the bay it was S. W. The following courses were selected: First and second classes, from judges' yacht off Tobey Island buoy No. 2, leaving Bird Island buoy No. 13 and Scragg Neck buoy No. 10 on port hand on return, eleven miles. Third class, leaving Dry Ledge buoy No. 12, Abial's Ledge buoy No. 1 and black buoy No. 3 on port hand, seven miles. The preparatory gun was fired at 12:04, being delayed four minutes waiting for the Mattapoisett boats.

The boats started as follows:

Name.	Owner.	Length.	Start.
FIRST CLASS.			
Mattie	Vice-Com. Stockton, B.Y.C.	25.10	12 09 32
Violet	Geo. H. Richards, B.Y.C.	24.05½	12 10 50
Atalanta	J. R. Thomas, B.Y.C.	26 10	12 11 05
Surprise	C. C. Hanley, B.Y.C.	24.01	12 11 40
SECOND CLASS.			
Flirt	Geo. H. Lyman, Jr., B.Y.C.	22.09	12 15 03
Iris	E. A. Bangs, B.Y.C.	21.08½	12 16 20
Tantrum	Jas. M. Codman, B.Y.C.	22.01	12 16 35
Echo	A. W. Baker, Chatham	21.10	12 16 48
Lestris	J. Crane, B.Y.C.	21.10	12 16 48½
Eleanor	Richard Codman, B.Y.C.	22.09	12 18 55
Romp	E. B. Robinson, Pocasset	22.10	12 19 00
THIRD CLASS.			
Vivian	R. F. Nickerson, Chatham	20.05	12 20 59
Clara B	Outram Bangs, B.Y.C.	18.06	12 21 15
Dolly	A. H. Hardy, B.Y.C.	20.01	12 21 49

Romp was timed by request, having failed to enter in time. Flirt's measurement is not official. Mystery, third class, was entered, but could not be got off the beach, where she had gone to clean her bottom, in time.

The two larger classes carried the N.E. wind for the greater part of the run down; about a mile this side of Bird Island they struck a calm and the rear boats closed up. After some time spent drifting around in puffs coming from all directions, Mattie struck a S.W wind and began to beat for the buoy. Surprise and Atalanta took it next, then the leaders of the second class.

Mattie rounded the buoy first and started free for Scraggy Neck. Surprise came next, gaining on her, then Atalanta, followed by Echo, Eleanor, Tantrum and Violet.

Mattie and Surprise carried the S.W. wind around Scraggy Neck buoy and started home before the wind, when Atalanta was three quarters, and Violet, who had passed Eleanor and Tantrum, half way across, the wind came out S.E. and they had to beat for the buoy, which put the two leading a long distance ahead. Atalanta rounded third, then Violet and Echo together, Tantrum and Eleanor.

All this time wind was N.E. at the judges' yacht. Mattie and Surprise carried the S.W. wind over the home line, but it immediately shifted back to the east. The others had it N.E. running home, and as they approached the line found the wind east and crossed line close hauled, as follows: Atalanta, Violet, Echo, Eleanor, Tantrum, Romp, Flirt, Lestris and Iris.

The third class got into the edge of the calm, but when clear of it had the wind N.E.; they stuck closely to each other, Vivian leading the way home, followed by Dolly and Clara B. Following is the summary:

	Actual.	Corrected.
FIRST CLASS.		
Surprise	2 49 50	2 35 30
Mattie	2 52 28	2 40 33
Atalanta	2 56 53	2 45 31
Violet	3 08 50	2 55 07
SECOND CLASS.		
Eleanor	3 02 27	2 44 41
Echo	3 03 36	2 46 12
Tantrum	3 04 59	2 47 57
Lestris	3 10 14½	2 52 50½
Flirt	3 11 30	2 55 31
Iris	3 11 35	2 53 49
Romp	3 03 48	2 47 49
THIRD CLASS.		
Vivian	2 06 51	1 55 54
Dolly	2 07 36	1 54 49
Clara B	2 07 44	1 53 37

Surprise, Eleanor and Clara B. take first prizes; Mattie, Echo and Dolly second prizes. The race being an open one, was sailed under the rules and allowances of the N. E. Y. R. Association. Judges, Edward Bangs, A. H. Hardy, W. Lloyd Jeffries. Judges' yacht, Madcap, B. Y. C.

EIGHTY-FIFTH RACE.

Saturday, July 5, opened with half a gale of wind from the S.W. and a pouring rain; the result was that only four boats started in the match for the Buzzard's Bay championship, and they were under three reefs most of the way. The B. Y. C. measurement was used in this race.

FIRST CLASS CATS.

Name.	Owner.	Length.	Actual.	Corrected.
Mattie	Vice-Com. Stockton	28.10	3 00 31	1 51 42
Flirt	George H. Lyman	25.10	2 13 06	2 00 43
Iris	E. A. Bangs	24.02	withdrawn.	
Tantrum	J. M. Codman	25.00	withdrawn.	

A one-gun flying start was used, Tantrum going off with the lead. Mattie overpowered the others in the beat down to Bird Island Light. Course same as on the Fourth. Judges, George H. Richards, J. P. Gardner, F. I. Amory and W. Lloyd Jeffries. Judges' yacht, Maude, B. Y. C.

BLUE WITH A GOLD CASTLE.

LA NUBIENNE.

THIS steam yacht, the first that has made the voyage to America under French colors, arrived in New York on Saturday morning from Montreal, having left Havre on June 10 and arrived at Quebec June 23. She has on board her owner, Mr. Edmond Blanc, Mr. Paul Saunieres, owner of the famous 40-tonner Myosotis, now the Eva; Mr. Fonande of the cutter Flamberge, and Mr. B. Clerc, proprietor of *Le Yacht*. The party left the yacht at Montreal, coming to New York by rail, visiting Niagara and Albany, joining the vessel here and leaving on Tuesday evening for Newport, where they spend a few days before returning to France.

The Nubienne, formerly the Cumbria, is named after the famous mare belonging to Mr. Blanc, winner of the Grand Prix in 1882, is bark rigged, of 470 gross tons and 596 Thames measurement, and was built by C. Mitchell & Co., of Newcastle, in 1881, being intended by her former owner, Lord Lonsdale, for a voyage around the world, but on his death she was purchased by Mr. Blanc.

She is 179.7ft. long on waterline, 27.1ft. beam, 13.7ft. depth and is built of iron, with five bulkheads and two decks, and is a splendid specimen of an ocean cruiser. Her fittings on deck are all of teak—houses, bulwarks and rail—while below she is finished with English oak. Forward are the crew's quarters on the lower deck, aft of which is a handsome dining saloon for the officers, their staterooms opening into it.

On the main deck aft is a dining saloon on the starboard side, handsomely finished in oak, and ornamented with a painting of the yacht's namesake, Nubienne. Aft of this is a stateroom, and further aft a bathroom, fitted with a very ingenious combination washstand, occupying but little space, while on the port side are staterooms for the servants. Aft of all is the smoking room, a semicircular apartment over the wheel, very handsomely fitted up, with a small yacht piano of English make, the entire keyboard of which folds up out of the way, the instrument, though of good tone, occupying about half the space of a small parlor organ.

The owner's stateroom is on the lower deck, and abaft it are the storerooms and magazine. The chartroom is a very cosy apartment in the forward end of the deck house, under the bridge. The latter is fitted with signaling apparatus of the usual construction, with lever and dial, but in addition has on each side three electric buttons, set under the rail, for signaling ahead, astern, stop, all parts of the ship being also connected by telegraph. The engines are of excellent design, inverted compound 25 and 47in.x27in.

The propeller is of bronze, two bladed, and so fitted that the pitch may be altered from 11ft. to 15ft., from inside the ship. Her armament is remarkable for a pleasure yacht, consisting of eight rifled steel breechloading guns, mounted, four on a side, on the main deck, all being fitted with hydraulic recoils. Besides these she carries an enormous duck gun, while below are a rack of Chassepot rifles and a number of revolvers.

After leaving the North River, the Nubienne steamed up through the Gate, and at 6 P. M., when opposite the Knickerbocker Y. C. house, and running at a good speed, took the ground on the reef between the black buoys. The steamer Pilgrim, seeing her danger, whistled loudly, but the warning was not understood, and she struck with a loud crash; backing off, however, though listing badly to port, proceeding on her way, however, without assistance from the two tugs that went to her help. The rocks were two feet out of water not 100 yards off, and three sailors were on her forward deck when she struck.

YACHTING ON LAKE ONTARIO.

THE first yacht race sailed on the Bay of Quinte this year took place at Trenton on the 1st inst., Dominion Day. The contest was for second class yachts, under B. Q. Y. C. rules, over a course of twenty miles, and the prizes were $60, $30 and $15.

Unfortunately the contest was marked by an incident very unusual in these waters, namely the capsize of one of the competitors—the Surprise, of Trenton.

It was not until after the noon hour had passed that the four competitors were started, the wind being then southwest, and of fair sailing strength. The order of going was as follows: Surprise (Trenton), 12h. 15m.; Iolanthe (Belleville) 12h. 16m. 57s.; Gracie (Belleville), 12h. 18m.; Enid (Trenton), 12h. 19m. 38s. About three miles of the course was windward work, the first two legs of it being a straight run down wind and the second with the wind abaft the beam.

All, except the Enid, carried gaff and jibtopsails; the Surprise, which had been lightened by more than half her standing ballast, gaining somewhat, and the Gracie overhauling the Iolanthe. At the lower buoy light canvas was taken in, but the crew of the Surprise were not quick enough with theirs, and, a sudden puff of wind taking her, over she rolled, those on board shouting to the other yachts to keep on their course, which they did, and the crew of the unfortunate craft were rescued by the Dauntless.

The Gracie was now in the lead, but was closely pressed by the Iolanthe, which, near Indian Island, was close alongside, but to leeward. Wishing to avoid a collision, the Gracie went about, and this cost her first place, and possibly the race, as the Iolanthe stood on and was able to round the mark, which she turned 4 minutes and a half ahead. On the next round the Gracie gained half a minute, but lost all she had made on the run to the harbor buoy, and from this out the Iolanthe gained rapidly, finishing at 4:27, ten minutes in advance. The Enid was fully half an hour behind the Gracie. The mishap to the Surprise was very much regretted, as she would otherwise have made a good race with the two Belleville boats, which thus won the two chief prizes.

At Kingston on the same day there were races for first, second and third classes—local craft. The Gen. Garfield won in the first class, the Laura in the second class and the Merlin in the third class.

Preparations are now being made for the regattas under the auspices of the Lake Yacht Racing Association, which promise to be successful. The Gracie having donned a new mainsail, will challenge the Iolanthe for the challenge cup held by the latter, and for which the former receives a handicap allowance of five minutes.

The big sloops Atalanta and Norah are looking well. The latter will have an entire new outfit of canvas from the loft of Oldreive & Horne, of Kingston, and will adopt the double head rig.

The Iolanthe has been fitted with a new wheel and side and deadlights of the most approved pattern.

We anticipate a rare contest on the 6th prox., with the Atalanta, Norah, Garfield, Aileen, Cygnet, Verve, Oriole, Madcap, Coquette, Alarm, Lady Standly and possibly others in the first class, and the Iolanthe, Gracie, Surprise, Emma, Laura, Katie Gray, Cricket and no doubt, other flyers in the second class.

There seems to be no prospect of a contest for the Fisher champion cup for sloops, which the Atalanta is ready to defend against all comers.

PORT TACK.

BELLEVILLE, Ont., July 3.

CRUISE OF THE MABEL.

Editor Forest and Stream:

It may interest you to hear the latest report from the yacht Mabel, O. Y. C., Captain Jas. H. Stebbins, Jr., of this city, now on a cruise from Clayton through the lakes.

Mr. Stebbins reports that he left Port Calborne, at the entrance to the Welland Canal, on the 26th, before a heavy northeaster, and made Detroit in twenty-four hours, the distance logged being 235 miles. For six hours the only sail carried was the foresail, and the sea was so heavy that two of the crew, both old lake sailors, were sick.

You may remember that the Mabel was changed last winter from a centerboard to a keel and given a cutter rig forward. Mr. Stebbins reports that the alterations not only make the yacht a better sea boat and handier, but have also increased her speed. W. F. HAPGOOD.

NEW YORK.

[The log of a former cruise of the Mabel appeared in FOREST AND STREAM of Jan. 24, 1884, since which cruise she has been changed to a keel boat with cutter rig.]

MIGNONETTE.—This cutter, described in FOREST AND STREAM of March 6, 1884, is now completed and has left her builders, Messrs. Wallin & Gorman, of Bay Ridge. We commend her to all those who are looking for something in place of the old-fashioned sloop, but are not prepared to accept the full cutter, as a great step in advance, and at the same time a boat they can step aboard of without doing violence to their patriotism. She has an iron keel of 1,700 pounds, 3,000 pounds of lead inside, a roomy cabin with good head room, lockers, etc., large cockpit above waterline with scuppers, steers with a stick and has a housing topmast. Her jib traveler, instead of running on the bowsprit, runs on an iron rod on top of the latter. The entire boat is handsomely finished throughout, mahogany in cabin and cockpit, pine ceiling and lockers, all varnished, deck of narrow pine, varnished. Her owner, Dr. Loring, is a member of the Larchmont Y. C., but will use her about Boston this summer. Messrs. Wallin & Gorman have also launched recently a very handsome little catboat, 17ft. on waterline, with 2ft. 6in. overhang, 6ft. 6in. beam, bright finish in cockpit and deck, rather straight sheer, and a neat looking boat in every way. She is intended for use on a small lake. They have also afloat a cabin sloop of the usual American type, for Capt. Samuel Greenwood, 30ft. on deck and keel, 12ft. beam and 2ft. 9in. draft, besides a smaller open sloop with a movable cabin, for Mr. J. L. Riker, of Shrewsbury. Length 22ft., beam 9ft., hold 2ft. 5in. Her ballast will be all iron inside.

ROYAL CANADIAN Y. C.—The R. C. Y. C. gave a sail on July 1 to their lady friends, starting from the club house about 4 P. M., the flagship Aileen, Commodore Leys, leading. Seven yachts were in line—Aileen, Oriole, Verve, Alarm, Coquette, Kent and Madeline. The fleet executed a number of maneuvers, being directed from the flagship by a new and simple system of signaling, worked by the inventor, Capt. Dupont, R. N. After forming a line each yacht tacked in succession, afterward following the flagship up the bay. Further maneuvers were prevented by a squall and a pour of rain, in which Alarm lost her mizzen, the yawl was washed off the deck of the Esperanza, and a sailboat was capsized. A collision nearly took place between the Aileen and a passenger steamer, the St. Jean Baptiste. Next week's cruise will be under the command of the Vice-Commodore, from his yacht Oriole.

SEAWANHAKA C. Y. C. BOOK.—The club book for 1884 comes to us in a very neat and shipshape cover of dark canvas, very much more appropriate and durable than the usual blue and gold. The list this year includes 227 members and 102 yachts, made up of 11 steamers, 17 schooners, 21 keel boats (17 cutters) 23 centerboard sloops and 30 open boats, among which are 3 catamarans and 1 canoe. Besides the club signals, the book contains some useful notes on the barometer, the United States fog signals, the signal code, a map of the club course and rules for colors, salutes, etc. We notice that the expression "under weigh" still has a place in the signal code, as in several other club books.

SEAWANHAKA C. Y. C., CRUISE.—The following order has been issued to members, for the annual cruise: New York, June 28, 1884. Dear Sir—The Club Squadron will rendezvous at Whitestone, Long Island, on Saturday, July 12, for the Annual Cruise. You are earnestly requested to communicate with the Secretary as promptly as possible, stating whether you will be able to join the fleet or not. The Secretary offers a prize of $25 in cash to the sailing master whose yacht upon inspection during the cruise is shown to be in the best order and condition, due regard being paid to completeness and condition of outfit.—L. F. D'OREMIEULX, Secretary, S. C. Y. C.

MAGGIE.—Mr. George Warren's well-known cutter Maggie was placed in Simpson's dry dock last week and some 600 or 800 pounds of the lead recently added to her keel were removed. It was decided by her sailing master during the Eastern Club races that she was trimmed too much by the stern. The removal of the lead brought her back to something more like her old trim, and although the Fourth was rather a poor day to determine how much improvement has been made, it is thought she will make a better showing in the races to come.—*Boston Herald, July 5.*

DAUNTLESS.—This yacht arrived in Newport on July 6, having on board her owner, Mr. Caldwell H. Colt, and Mr. J. Neilson Howard. She left Madeira on June 12, but was delayed by fogs, calms, and head winds. On her arrival she at once hoisted her quarantine flag, which was no sooner seen from the shore than the report spread that she had some contagious disease on board, to the dismay of the residents of Newport. The Harbor Master, Capt. Townsend, boarded the yacht, however, and finding all well, ordered the flag to be taken down.

A NEW BOSTON CUTTER.—A fine specimen of a moderate cutter has just been finished by Mr. Jacob Rood. Her length on waterline is 31ft., beam 7ft. 8in., depth 6ft. Keel, stem and stern of white oak, frames of the same, double 2½x2½ spaced 12in., planking of clear yellow pine in single lengths. Keel of lead, 2½ tons, with composition bolts. Mast 7in. at deck, 22ft. from deck to hounds; head 5ft., with housing topmast 20ft. long. Main boom 26ft., gaff 18ft. 6in., bowsprit 14ft. outboard, fitted to house.

SURF.—Yacht Surf, Capt. Rathborne, returned from her easterly cruise on the morning of July 4. She cruised as far as Gloucester, and met with some very heavy weather. Capt. Rathborne reports a series of calms, gales and fogs, which proved anything but enjoyable. He thinks Chesapeake Bay offers many more attractions to a New York yachtsman, and intends cruising there next summer.

LARCHMONT Y. C.—At a regular meeting of the Larchmont Y. C. on Saturday evening, the following members were elected: John W. Beers, R. H. Egleston, John Q. Underhill, Otto Sarony, E. E. Chase, Arthur Padelford, Edward M. Padelford, Henry S. Hovey, J. H. Wainwright, H. Ellis Hart, Charles Elliot Warren, Charles J. Osborn, Howell Osborn, Alfred de Cordova and Lewis H. Spence.

SAN FRANCISCO YACHTING.—Halcyon, schooner, built last year for Mr. H. L. Tevis, has been sold to Mr. J. D. Grant, who will put her in thorough condition, making several changes below, and will probably put her in the races and cruises of both clubs. Mr. Con O'Connor will present the yacht with a full suit of colors, imported for her from England.

MERLIN.—This cutter was launched on Wednesday of last week from her builder's shop, South Brooklyn, and now lies afloat with mast and bowsprit and rigging in place. She shows to even better advantage outside than when in the shop. Her joiner work is partly in, and she will soon be ready for service.

KINGSTON, ONT.—In the races held on Dominion Day, the Garfield, in the first class, beat the Hebe by 24 minutes, the Laura winning in the second class, with Una, Zeta and Victoria in order behind her, while Merlin won in third class.

DAISY.—This yacht arrived in Boston on Thursday last, and will be sailed to New York, calling at Provincetown, Newport and New London. Her sailing master, William Martell, came with her on the steamer.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

TOPEKA.—Fort Davis, Tex.—1. The address is Topeka, Kan. 2. He has pointers of Faust, Bow and Sleaford blood, also a strain of black pointers.

J. C. S., Pittsburgh.—1. What food will a chicken hawk eat beside raw meat? 2. What is the right food for raccoons? Ans. 1. Raw meat is the proper food. It will eat only animal food. 2. A raccoon

will eat almost anything, meat, raw or cooked, bread, eggs, green corn or fruit. Scraps from the table are as good food as anything you can give it.

J. A. G., Washington, D. C.—The Denison target pads may be obtained through any dealer in firearms. They are specially prepared for testing pattern and penetration.

B. R., Buffalo.—Will you kindly inform me if there is a polo club organized in Chicago, or in any city west of Buffalo, and also give me their names if possible?—Ans. We know of no such club.

M. C. Waterbury, Ct.—At a Massachusetts target, out of a possible 60, A. scored 9, 11, 10, 9, 11, total, 50. B. scored 9, 9, 10, 10, 12, total 50. Is it a tie, or does A. receive the first prize? Ans. A makes the better score.

G. W., Horicon, N. Y.—It is our intention around Brant Lake to have a petition in this fall at Albany to get our time, close, extended to July 1. Can we do this? Ans. You need not petition the Legislature. Your county supervisors have authority to *extend* any of the close seasons. A local enactment will answer your purpose.

INQUIRER.—1. How does the sturgeon rank as a food fish, or is it fit for food? 2. Where is it mostly found? Ans. In England it is the royal fish, and the first one of the season caught in the Thames goes to the royal table. At Albany and along the upper Hudson, where the Dutch settled, it is a favorite. The fishermen of Long Island Sound will not touch it, and it varies in rank in different parts. The flesh is oily, and if parboiled first it makes splendid cutlets. 2. The rivers of the Atlantic coast and the great lakes. It spawns in fresh water.

C. A. R., Taunton, Mass.—1. What are the best places for trout fishing on the Lehigh Valley Railroad? 2. How is Mauch Chunk for fishing? 3. What kind of fish are to be found at or near Geneva, N. Y.? Ans. 1. Meshoppen, Mehoopany and Tunkhannock. 2. There is some trouting to be had in that vicinity. 3. Perch, sunfish, black bass, pickerel etc.

H. B., Glasco, N. Y.—Will you be kind enough to inform me of the name of the bug inclosed in the paper. I have noticed its presence among my bird skins to my regret. Ans. The beetle belongs to the genus *Dermestes*, a museum pest. Poison your skins well. If the bugs are among them in numbers, take the skins out and beat them at frequent intervals for a few weeks.

A. J. J., Hydesville, Vt. A few days ago I shot a bird on our lake here that I cannot identify to my satisfaction. I supposed it was a loon, but do not find any description that fits the bird in Coues's "Key." The bird measured 30½ inches in length, is pure white from bill to tail on the under parts and under sides of wings; back of head and neck a brownish gray and also the back and tail, feathers on back brownish black, slightly edged with white, a short and well formed tail. Legs posterior; inside of legs white and the outside black, four toes on foot, rear toe quite small and the three front ones webbed, similar to a duck; nail on end of toes flat. There are no round spots on the bird anywhere that I can see. It is built the same as a loon, head, bill and neck, and in fact all parts, but the coloring is different. The bird I shot was in company with one other near the highway on the lake, as I was passing with my team and I fired from the buggy, killing it the first fire. The other one immediately disappeared and was out of range of any shotgun, when it made its appearance. The other as near as I could judge was similar to the one killed. Ans. We presume from your description that the birds were either young loons (*C. torquatus*), or young black-throated divers (*C. arcticus*).

A. M. I., Liberty, Neb.—1. Is the bird called kildeer good to eat? 2. Is it a plover or snipe? Large numbers are coming on the prairie which is being newly broken. After the grass has been burned off the prairie, thousands of birds come which people here call snipe. 3. Is it the habit of snipe to peck around on the burned prairie? 4. How many kinds of snipe are there? 5. Are turtle doves good to eat? 6. Do southern people eat robins? Ans. 1. Yes. 2. A plover. 3. Yes, snipe and plover are likely to do it. 4. About ninety species, of which perhaps thirty-five are found in this country. 5. Yes. 6. Yes.

PATIENT, New York.—1. Can you let me know of any book which treats of black bass and trout? 2. What bait is best for bass? 3. What places in the Green Mountains are those fish caught? Ans. 1. The American Angler's Book, by Thad Norris, price $5.50; Fishing in American Waters, by Genio C. Scott, price $3.50, treat of both. The best book on black bass is Dr. Henshall's; price $2.50. We can furnish them. 2. Minnows, crayfish, helgramites and frogs. 3. There are trout in most of the mountain streams, but the fish are small. Black bass are not plentiful in the State, but some of the ponds on the west side of the mountains contain them.

Harrison's Celebrated Fish Hook.

Registered.

Trade  Mark.

Whereas, It having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and **we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours,** which are to be obtained from the most respectable wholesale houses in the trade.

Signed, **K. HARRISON, BARTLETT & CO.,** Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England.

Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

Refrigerator Baskets.

The grandest thing ever invented for fishermen or for parties living out of town, as articles of a perishable nature can be carried around all day in the hottest weather and will be kept cold as ice. These baskets being lined with tin and packed with boiler felt are perfect portable refrigerators, preserving the contents and giving plenty of ice-water for drinking purposes. They are made of the best rattan, with drop handles, double lids and straps on top, and are the strongest and most handsome baskets ever made. Two sizes. Price $3.50 and $4.50. Sent by express on receipt of price by the patentee, JOHN R. HARE, 63 Fayette street, Baltimore, Md.

Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

THIS ☞

Is our Skeleton Coat or Game Bag. Weighs but 15 ounces. Can be worn over or under an ordinary coat. Has seven pockets and game pockets. It is of strong material, dead grass color, and will hold the game of a successful day without losing a hair or feather. We will mail it to you, postage paid, for $2.00. Send breast measure.

A RARE CHANCE!

The American Arms Co., manufacturers of the Fox patent double guns, are now running their entire gun machinery on the single semi-hammerless guns and their new double-action extracting pistols, and will make no more double guns at present, except on orders, at full prices. The undersigned, having purchased all their stock of Fox guns, some 300 in all, of the various grades, No. 5 list and above, will offer them to sportsmen—"first come, first serve"—at 25 per cent. discount from the regular list while they last. Here is an opportunity to purchase a fine gun at an unprecedentedly low price. They are all warranted of the finest qualities in every respect, and cannot be duplicated when this lot is exhausted.

Orders may be sent as usual to the **AMERICAN ARMS CO., or to T. H. RAYMOND, Treasurer, 103 Milk Street, Boston.** Will be sent C. O. D. for trial and examination.

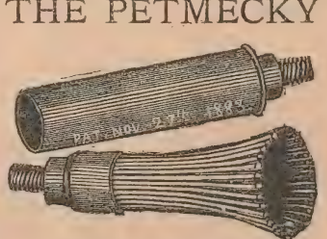
EXCELSIOR BAIT PAIL.
(Patented). **The Fisherman's Friend.**

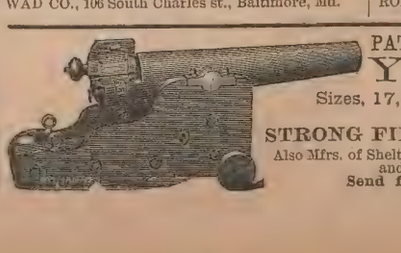


There is an inside pail which can be removed and placed in the water the same as a "fish car," thus keeping the bait alive for an indefinite time. The pan which fits in the inside pail can be raised and lowered, thus affording an easy selection of bait without wetting the hand. The bait is kept alive during transportation (the critical time) by the continuous flowing of the water through the perforations, thus causing a never failing supply of fresh air. For sale by all dealers, or will be sent on receipt of price. 8 Quarts, $2.50 each; 12 Quarts, $3.25 each. Manufactured only by DE LA VERGNE & CO., 176 Chambers street, New York.

STORM-DEFYING WINDMILL.

For pumping water for rural residences, fountains and fish ponds. A. J. CORCORAN, 76 John street, New York City.

THE PETMECKY

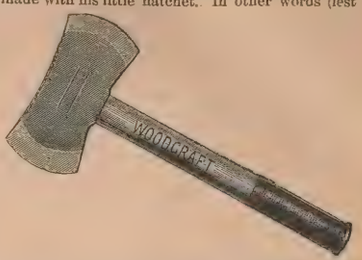


GUN CLEANER.

The only Cleaner that will thoroughly clean a gun barrel, doing the work equally well in choke bores without adjustment. Will do the work quicker and better than all other implements, for the purpose, combined. Price, $1.25. By mail, 10 cents extra. Ask your dealer for it. Discount to the trade. Circular free.

J. C. PETMECKY,
Wholesale Dealer in Guns, Fishing Tackle, etc., Austin, Texas.

SPORTSMEN'S DELIGHT.
Merino Elastic Felt Gun Wads
SOMETHING NEW!



Ask your dealers for them. If he don't have them send us 40 cents for sample box of 256, and we will send, postage prepaid. Greatly lessens the recoil, keeps gun cleaner, gives better pattern and penetration than any other wad. One box will load twice as many shells as a box of pink-edge. Just the wad to use over powder and fill up shells, as it is only half the price of other felt wads. Manufactured only by THE MERINO ELASTIC FELT GUN WAD CO., 106 South Charles st., Baltimore, Md.

PATENT BREECH & MUZZLE-LOADING

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JULY 17, 1884.

VOL. XXII.—No. 25. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. American newsdealers should order through the American News Company, those in England, Scotland and Ireland, through Messrs. Macfarlane and Co., 40 Charing Cross, London, England.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

PUBLISHER'S DEPARTMENT.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, yachting, canoeing, and kindred subjects, than is contained in all other American publications put together.

AN AFTERNOON ON THE RANGE.

TO escape from the noise and worriment of the city away to a restful afternoon on the range is a rare pleasure which many have learned to love. There is about the sport of target-shooting a fascination which is very powerful to certain men. Those who are engaged in sedentary pursuits can find no better way of taking the air and securing a certain share of field sport than in this quiet battering away at the bullseye. The mind is engaged at the same time that the body is taking a good share of exercise. The man very soon finds that, barring physical imperfections, the question of becoming a good shot rests entirely with himself. If he is in good condition or in fine form, the chances are that his score will be of a fine order, but a bit of dissipation on the night before comes back to him at once in a slipping from the bullseye, and a falling away in his average. The best man wins there in the great majority of the cases, and it is this which encourages men to persevere even when they find themselves far down in the list when first going upon the range.

To the casual spectator there are many sights far more interesting than a rifle match, even when the fight is a sharp one. The looker on is very soon informed that he is to use his eyes only, and to take no further part in the affair. Ordinarily, unless he has started in at the opening of the match and kept a very accurate tally, it is impossible to determine how the score stands and what the relative position of the contestants may be. The outsider is reduced to the necessity of sitting down, hearing the sharp bang of the rifle, followed by the puff of smoke, and then in time a bobbing up of the disk, white, black or red, as the case may be. Very soon the watcher grows tired of this, and having no appreciation of what each shot means in the way of thought and effort, he wanders away and finds something to engage his attention in the neighborhood.

While the visitor to the range who comes merely to look on, spends perhaps a very dull afternoon, it is entirely different with the man who has entered his name on the list of competitors. To him the range is simply the place where he is trying the results of his previous precautions and judgments on a dozen points. It is not alone the buying of a good gun which makes a good rifleman. We have seen the finest sporting rifles in the hands of new comers or men who are not willing to take the working road to victory, beaten by the ordinary "gas-pipe" weapons issued under contract to troops, simply because the trooper puts a good percentage of brains and judgment behind his gun when he stood up to shoot.

The trip to the range is always an enjoyable one to the enthusiastic rifleman, because he goes along buoyed up by expectancy. He looks forward to a string of bullseyes, and once on the range he has a score of details to look after. When the ordinary visitor merely notes that it is a sunny afternoon, with a sharp wind blowing, the man who is to shoot is already busy calculating precisely how much of an allowance he is to make for the condition of the light and the force of the wind. He has a book of past scores, not merely the total actually made out of a possible highest score, but a briefly-written history of each shot. He turns back over his records until he finds a set of conditions very similar or exactly so to the present state of wind and weather, and then he duplicates the record on his front and rear gauges. Then comes the shot. It is taken with care, the holding was perfect, the spirit level in front had been kept at the dead-center point, there had been no error in the setting of the sights, the cartridge had been made up with the greatest care, and at the last instant before firing the cautious score-maker had quickly glanced about and made sure that there had been no little twitch in the wind, insignificant, perhaps, to the casual eye, but instantly detected by him, because he knew that a neglect to allow for it meant an outer possibly in place of the expected bullseye. Bang, and the bullet is off beyond recall on its way targetwards. The returns come quick, for the sharp reëchoing ping shows that the leaden bolt has flattened and melted itself against the target, and this report is verified a second or two later by the opening of the trap. It is time for the appearance of the disk, and it comes, not the expected white-faced one telling of a perfect shot, but a red one, which creeps up until it hides a good share of the bullseye and notes a hit close to its lower edge. There is a feeling of disgust at even this loss of a single point, but the rifleman has caught his bearings. He goes up a point on his rear sight, holds as he had done in the previous shot, and there comes an encouraging bullseye disk in response. Again and again it comes up, and then the red disk reappears, only to remind the marksman that shooting is a very uncertain thing, and that in a little streak of forgetfulness he has allowed the wind to shift to the other side of the 6 o'clock point, and that he finds a bullet wafted away to a 5 o'clock center in place of taking its place with the bunch of hits in the 7 o'clock corner of the white iris.

It has in it the delightful element of uncertainty which makes any sport enjoyable—victory is possible, but it must be worked for. It is a perpetual struggle from the firing of the first shot until the final one is safely lodged against the iron disk or it may be the grass parapet before it. Then comes the homeward run. Those who head the list are congratulated and explanations are in order. Those who won give minute explanation and hints as to the precautions taken with every part of their work, from the buying of the empty cartridge shell, through the delicacies of loading, on to the manipulations of firing, and so to the final pull off. Riflemen, generally, are a generous set, and freely help each other to the good results of any discoveries made by them. There is such a large margin of uncertainty that there is ample room for a multitude of explanation, and unless every point is properly covered the chances are that a failure will be scored. The defeated ones are, of course, full of excuse during the homeward trip. Everything is held to blame by some over and beyond their own carelessness. There are cranks on the range as at every point, and to them there is a different wind of a peculiarly perplexing sort, and as they wind themselves up in apology the old range masters smile in a good-natured fashion and says truly, "Practice makes perfect."

TRICKS UPON TRAVELLERS.

THE stroller along South street can find considerable amusement in the inspection of the motley collection of statues that keep watch and ward from the bows of the various ships; a collection that throws the Eden Musée, Barnum's Menagerie, and the Cesnola Antiques, entirely in the shade. A notable addition was made last week to this happy family, in the shape of a huge black and gold griffin that gazed ferociously down from the balance dock on the heads of passers by, from the bow of the French yacht Nubienne.

The reason for the presence of the yacht and its fierce attendant was alluded to in FOREST AND STREAM of last week, but further details of the mishap have since come to light. On anchoring off Twenty-third street, Captain Miller applied for permission to land his boats there, and was approached by a person representing himself as a pilot, and bringing a note signed H. G. Boyton, Harbor Master, demanding a payment of $7.50 for the privilege of landing. The young man, who gave his name as Boulanger, also offered to pilot the yacht to Newport, and as he exhibited some certificates, the captain engaged him.

On coming aboard on Wednesday afternoon, he at once asked for a chart, which excited some suspicion on board the yacht, but he was allowed to take charge, and ran down the Hudson, up the East River and through Hell Gate safely, but when once clear of the Gate, he put her helm over, in spite of a loud warning from the steamer Pilgrim, and deliberately ran the yacht on the reef just south of South Brothers Island, the rocks showing plainly above water a short distance from her bows.

Two tugs came to her assistance, and she was soon afloat, the pilot (?) getting on one of the tugs to come to the city for another pilot, first borrowing five dollars for his expenses. It is needless to say that neither man nor money has been seen since. The Nubienne leaked somewhat, so she ran back to New York, going on the dock on Thursday.

The damage proved to be very slight, she having struck squarely on the keel, in two places, at each of which half a dozen rivets were cut out and replaced, no other damage being apparent. Her trip to Newport was, however, abandoned, and she left on Saturday for Havre.

An inquiry among pilots and officials failed to discover either the bogus harbor master or pilot, neither of the names being in the directory, or known to the pilots. It also appears that there is no one whose business it is to detect and punish such rascals, as the laws are at present.

THINGS HAVE COME TO A PRETTY PASS when men who have been detected in violating the fish laws are appointed to enforce these laws. A case in point is the recent appointment by the Governor of New Jersey of one Abram Terhune, as Fish Warden of Bergen county. Terhune, it appears, has been somewhat notorious in connection with the law applying to bass. He was once arrested by the Passaic County Fish and Game Protective Association for having caught bass out of season. Why the Governor of New Jersey should put such a man in the office of Game Warden is an "opaque conundrum" which we shall not try to solve.

LIST OF OPEN SEASONS.—A list of the open game and fish seasons for several States are given in another column; others will follow as soon as we can get the information. Great care is exercised to make the list authentic and a safe guide to the reader, who eagerly scans it to learn when the law is off on his favorite game. Few changes of dates have been made during the past year. This is well. As the laws become better known they are better observed. Frequent changes confuse the public. Last year we republished our list in convenient pocket form, and it has been in great demand. This year we shall do the same thing.

THE ONTARIO COLLIE SHOW, which is to be held at Toronto, Sept. 16–18, should be well supported. The collie is a valuable dog. He ought to be better known. If farmers generally understood what a collie would do for them on the farm, the demand for good dogs would exceed the supply. Exhibitions like the one to be held at Toronto are useful, because they display in a very effective way just what the collie is and what he can do. Such an exhibition ought to be given at all the State agricultural fairs in this country.

WHERE ARE THE MIGRATORY QUAIL?—It is a long time since we have heard anything about them. Did all the birds disappear never to be seen again? Who can give any information that will lead to a detection of their whereabouts?

The Sportsman Tourist.

MEMORIES OF SENACHWINE LAKE.

BY T. S. VAN DYKE.

First Paper.

TWENTY years have gone since first I trod Senachwine's boggy shores and bent the oar in its shining surface; yet it seems as if it were but yesterday when I was there. Many a happy day before that had I spent along the rushing stream or in the deep dark woods; and many a bright day since has left its autograph in my album of delightful recollections; yet to no period does memory so fondly turn, and around none so lovingly linger as around the two months I spent at Senachwine twenty years ago.

When scarcely out of childhood I had seen Bob White bounce fluttering along the frosty stubble, and at an age when few boys are allowed to even touch a gun, had seen the woodcock furl his whistling wing amid the saddened foliage of autumn, and in the tangled cat-brier brake had hushed the obstreperous wing of the ruffed grouse. But when I saw Senachwine I found that I had only been playing around the gate of Elysium, enchanted with the first flowers that I met and little deeming of anything beyond. I had indeed shot some ducks along the sloughs and snipe meadow of the Atlantic coast, had read nearly all that up to that time had been written about duck shooting, and fancied that I knew something about it. But like a child at the theater an hour early for the play I had sat dreamily gazing at a miserable daub on a curtain supposing that to be the show that I had come to see. It was at Senachwine that the curtain was first lifted and the marvellous reality that lay behind it burst upon me in all its wildest and fullest splendors.

At Henry, Marshall county, Illinois, some two miles below Senachwine Lake, I stepped from the cars into the open arms of as noble a band of sportsmen as ever stopped a whizzing wing. Though a stranger to them all, the mysterious tie of the field was enough. That I was fond of the chase like themselves, and had come a thousand miles to enjoy it, was all they knew or cared to know of me. They gave me a key of the club boat house and placed at my disposal all hunting paraphernalia that I had not brought, took me along upon all hunts, placed me upon the best stands for shooting, and fairly pushed me upon pleasure in every possible way.

It was a bright September afternoon, the day after my arrival at Henry, that Charles Everett—one of the friends above mentioned—and I, were paddling up the crooked slough that leads from Senachwine to the Illinois River. Woodducks, mallards and teal rose squealing and quacking from the slough ahead of us, but Everett paid no attention to them, and I soon ceased dropping the oar and snatching up the gun and getting it cocked and raised just as the ducks were nicely out of range. When we reached Mud Lake—a mere widening and branching of the slough at the foot of Senachwine, we drew the boat ashore. Huge flocks of mallards rose with reverberating wings from the sloughs all around us and mounted high, with the sun brightly glancing from every plume. Plainly could I see the sheen of their burnished green heads and outstretched necks, the glistening bars upon their wings, the band of white upon their tails surmounted by dainty curls of shining green. Everett paid no attention to them. But could I lose such a chance to show him that I could shoot?

As my gun rang out with right and left at a roaring flock, and I saw two relax their vigorous hold on air and descend in a whirl of cinnamon, white, green and gray, I looked around at my new friend with a smile of pride. He too smiled, though for another reason. They had fallen on the other side of a slough, the mud of which exhibited so morbid an appetite for my high-topped wading boots at the second or third step into it that I too smiled—after beating a safe retreat. The idea of considering where a bird was going to fall was something entirely new to me. Probably at this day one is glad to land a duck anywhere along those shores, but at that time ducks were so plenty that the first consideration was generally to land them where they were easily picked up. I never got those ducks, and I shot at nothing more until I saw Everett begin. He soon placed me in some high reeds on a broad tongue of land running out between two shallow sloughs while he went to another point some two hundred yards or more away.

There was already in sight what seemed to me enough of ducks to satisfy any one. Long lines of dark dots streamed along the blue sky above Senachwine, up the Illinois and over Swan Lake—between the river and Senachwine—while from down the slough, up the slough, from over the timber on the west, and the timber along the river on the east came small bunches and single ducks by the dozen. Shall I ever forget that big mallard that bore down upon me before I was fairly hidden in the reeds? He came along with sublime indifference, winnowing the air with lazy stroke, bobbing his long green head and neck up and down, and suspecting no danger. As he passed me at about twenty-five yards I saw along the iron rib of the gun the sunlight glisten on his burnished head. I was delightfully calm, and rather regretted that letting him down was such a merely formal proceeding. If he were further off or going faster, it would be so much more satisfactory, etc., you know. Nevertheless he had to be bagged whether skill was required, or not, so I resigned myself to the necessity and pulled the trigger. Had the sun dropped from heaven at the report of the gun I could hardly have been more surprised. The duck rose skyward with thumping wings, leaving me so benumbed with wonder that I never thought of the other barrel.

But little time was left me for reflection; for a wood duck, resplendent with all his gorgeous colors, came swiftly down from the other direction. Every line of his brilliant plumage I could also plainly see along the gun, for I was as cool as before. Yet this gay rover of the air never condescended to fall sheer, rise or even quicken his pace, but sailed along at the report of each barrel as unconcerned as a gossamer web on the evening breeze.

I concluded to retire from the business of single shots and go into the wholesale trade. This conclusion was firmly braced by the arrival of fifteen or twenty mallards in a well massed flock. They came past me like a charge of cavalry, sweeping in bright uniform low along the water with shining necks and heads projecting like couched lances. I could see four or five heads almost in line as I pulled the first trigger, yet only one dropped and that one with only a broken wing. As they rose with obstreperous beat of wing I rained the second barrel into the thickest part of the climbing mass and another one fell with a broken wing, while another wabbled and wavered for a hundred yards or more, then rose high and hung in air for a second, then folding his wings descended into a heavy mass of reeds away on the other side of the main slough. Meanwhile my two wounded ducks, both flattened out on the water, were making rapid time for the thick reeds across the little slough and both disappeared in them just as I got one barrel of my gun capped.

So it went on for an hour or so. There was scarcely a minute to wait for a shot, yet in that hour I bagged only four or five ducks; and I should be extremely reluctant to swear that two or three of them were not mudhens. I had already seen more ducks than I had ever seen before in my whole life, tame ones included. Yet in the full tide of pleasure I was slowly drowning under a weight of bitter disappointment. The nice little gun that had cost so many guineas in London, that had such a delicate balance, such a perfect fit to my shoulder, whose joints were so perfect, and whose locks had such an oily play and musical click, whose vent plugs, too, were of pure platinum—I had carefully tested them with all the acids known to chemistry—that dear little pet gun that I had so carefully cleaned and polished and oiled and filled with tallow, if I laid it by for a week, that beautiful little gem that had killed so many long shots at field plover and made so many bushy tails relax in the tallest hickory trees, would not stop the slowest duck at thirty yards more than once in five or six shots. And my feelings were not soothed by the steady, dull "wop" that followed each report of Everett's gun, no larger than mine and a cheap American potmetal at that. To tell the truth, I felt a slight nibbling of envy at my heart strings.

While gazing a moment into the blank that despondency often brings before me, two blue-winged teal shot suddenly across the void. With the instinctive quickness of one trained to brush shooting, I tossed the gun forward of the leading teal about the same space that I had been accustomed to fire ahead of quail at that apparent distance. The rear duck, fully four feet behind the other, skipped with a splash over the water, dead, while the one I had intended to hit skimmed away unharmed. I had fallen into the common error of tyros at duck shooting, viz., underestimating both the distance and speed of the game.

Some of my friends who had never been west of the Alleghanies had often said that there was no sport in duck shooting, that it took no skill to stop a clumsy duck in clear, open space, and that the duck was not a game bird anyhow, etc. How I wished for the presence of some of those friends that evening as old Phœbus entered upon the home stretch and his glowing chariot neared the gate of gilded clouds. The number of ducks increased by the minute. They came with swifter and steadier wing and with more of an air of business than they had shown before. Those hitherto flying were nearly all ducks that had been spending the day in and around Senachwine and its adjacent ponds and sloughs. But now the host that during the day had been feeding in the great cornfields of the prairie began to move in to roost, and the vast army of traveling wildfowl that the late sharp frosts in the North had started on their Southern tour began to get under way. Long lines now came streaming down the northern sky, widening out and descending in long inclines or long sweeping curves. Dense bunches came rising out of the horizon, hanging for a moment on the glowing sky, then massing and bearing directly down upon us. No longer as single spies, but in battalions they poured over the bluffs on the west, where the land sweeps away into the vast expanse of High Prairie, and on wings swifter than the wind itself came riding down the last beams of the sinking sun. Above them the air was dotted with long wedge-shaped masses or converging strings more slowly moving than the ducks, from which I could soon hear the deep, mellow honk of the goose and the clamorous cackle of the brant. And through all this were darting here and there and everywhere ducks, single, in pairs, and small bunches. English snipe were pitching about in their erratic flight; plover drifted by with their tender whistle, little alarmed by the cannonade; blue herons, bitterns and snowy egrets, with long necks doubled up and legs outstretched behind, flapped solemnly across the stage; while yellow legs, sand snipe, mud hens, divers, I know not what all, chinked in the vacant places.

When I shot the last one of the two teal ducks instead of his leader, I thought that I had discovered the art of missing, and fondly imagined that the skill I had acquired by shooting in brush would now show my friend Everett something worthy of his notice. How the bright bloom of that youthful conceit wilted under the fire that now consumed my internal economy! The nerves that felt but a slight tremor when the ruffed grouse burst roaring from the thicket now quaked like aspens beneath the storm that swept over me from every point of the compass. There I stood, the converging point of innumerable dark lines, bunches and strings all rushing toward me at different rates of speed, indeed, but even the slowest still fearfully fast. There I stood bothering with a muzzleloader, loading it with trembling hands, fever heat and headache from its recoil under the heavy charges I was vainly pouring into it, with the last duck that had fallen swimming away only wounded, half afraid to reshoot it because my ammunition was getting exhausted, yet knowing that it would surely get away if I did reshoot it; painfully conscious, too, that my chances of hitting a well duck were fragile compared with the certainty of a shot at the cripple, there I stood delighted yet bewildered, ecstatic yet miserable. And little conscious of how cruelly he was harrowing my feelings, Everett called out:

"Let everything go now but mallards, and land them close to your feet."

A fine sentiment! Very appropriate, neatly expressed and handsomely emphasized by the wop of a four-pound mallard in the mud beside him. He might, however, have spared his wisdom for a worthier subject.

Never did nature make a fitter background for such a display as appeared when twilight sunk over the earth. The sky was one of those rare autumnal skies, on which light is shattered into a hundred tints, when, above the horizon all is clear cut in sharp outline, and over all below it lies a pallid glow that intensifies all brilliant colors, but throws a weird, sepulchral gloom upon all somber shades. From the departed sun a broad, rosy light radiated far away into the zenith, while the clear sky on the east was changed by the contrast into pale gold tinged with faded green. North and south the deep blue changed into delicate olive tints, shading into orange toward the center of the great dome. On the west were cloud-banks of rich umber, fringed with crimson fire, on the east long banks of coppery gold, and aloft long fleecy streams of pale, lemon-colored vapor. Over such a stage now suddenly poured a troop of actors, that made the wonders of half an hour, aye ten, five minutes ago seem a mere puppet show.

Hitherto the ducks had all come from the level of the horizon. But now from on high, with a rushing, tearing sound as if rending in their passage the canopy of heaven, down they came out of the very face of night. With wings set in rigid curves, dense masses of bluebills came winding swiftly down. Mallards, too, no longer with heavy beat but with stiffened wings that made it hiss beneath them, rode down the darkening air. Spritgails and other large ducks came sliding down on long inclines with firmly set wings that made all sing beneath them. Blue-winged teal came swiftly and straight as flights of falling arrows, while green-wings shot by in volleys or pounced upon the scene with the rush of a hungry hawk. The old gray goose, too, came trooping in in untold numbers, though few came near enough to give us a fair shot. One fell at a long shot from Everett's gun, striking the earth with a crash that suggested the fall of one of the heroes of Homer—

Doupesan de peson, etc.,

But nearly all of them steered high along the sky until over Senachwine Lake, or Swan Lake—a little below us to the northeast—then, lengthening out their dark strings, they descended slowly and softly in long spiral curves to the bosom of the lake. Brant, too, dotted the western and northern skies, marched along with swifter stroke of wing and more clamorous throats until over the water's edge, then slowly sailing and lowering for a few hundred feet in solemn silence, suddenly resumed their cackle, and like a thousand shingles tossed from a balloon, went whirling, pitching, tumbling and gyrating down to the middle of the lake. Far, far above all these and still bathed in the crimson glow of the fallen sun, long lines of sandhill cranes floated like flecks of down in their southward flight, not deigning to alight, but down through a mile of air sending their greeting in long-drawn, penetrating notes, such a flight as he must often have seen who wrote:

Æthera trauant
Cum sonitu, fugiuntque notos clamore secundo.

Myriads of ducks and geese traveling from the north, swept by, far overhead, without slackening a wing. Far above us, the mallard's neck and head, looking fairly black in the falling night, could be seen outstretched for another hundred miles before dark. "Darkly painted on the crimson sky," the spritgails streamed along with forked rudders set for a warmer region than Senachwine. Widgeon sent down a plaintive whistle that plainly said good-bye. Bluebills, woodducks, spoonbills and teal, sped along the upper sky with scarcely a glance at their brethren, who chose to descend among us. And far over all, with swifter flight and more rapid stroke of wing than I had deemed possible for birds so large, a flock of snowy swans clove the thickening shades as if intending to sup in Kentucky instead of Illinois.

Yet, of those that tarried there was enough for me. With tremulous hand I poured my last charge into the heated gun and raised it at a flock of mallards that were gliding swiftly downward, with every long neck pointed directly at my devoted head. *Wheeooo* shot a volley of greenwings between the mallards and the gun; *kssssss* came a mob of bluewings by my head as I involuntarily shifted the gun toward the greenwings; *wiff, wiff, wiff, wiff* came a score of mallards along the reed tops behind me, as, completely befuddled with the whirl and uproar, I foolishly shifted the gun to the bluewings. As I wheeled at these last mallards after making a half shift of the gun toward the bluewings, they saw me and turned suddenly upward, belaboring the air with heavy strokes, and just as I turned the gun upon them a mass of bluebills with the sound like the tearing of forty yards of strong muslin came in between, and just behind me I heard the air throb beneath the wings of the mallards I had first intended to shoot at. The gun wabbled from the second mallards to the bluebills and then around to the mallards behind me—each chance looking more tempting than the last—and finally went off in the vacancy just over my head that the mallards had filled when I raised it.

Perhaps you think I sighed for a breechloader about that time. If I sighed for anything it was a garden rake, for it would have been about as efficient as the gun and considerably easier to load; and I don't feel at all certain even now that I could not have raked down a few ducks before dark, while I feel quite positive that I could not have done so with a revolving rack of loaded guns at hand, with a gamekeeper to hand them to me.

But in a moment I sighed for nothing. You who think you know all about duck shooting, if you have never been in such a position, have something yet to learn. Excitement and success you may enjoy to the full but while your ammunition lasts you know nothing of the pleasures of contemplation. Amid the shock and jar and smoke, the confusion of even loading the quickest breechloader and retrieving the ducks even with the best of dogs you see nothing compared to what you may see without a gun. Many a mile would I walk to-day to see that scene once more and gladly would I leave the gun at home. I had felt my importance as a factor in the universe more or less reduced at Niagara, but now I felt completely annihilated. As I dropped the worthless gun upon a muskrat house and sat down upon top of it the whole world where I had been living vanished in a twinkling and I found myself in another sphere filled with circling spirits all endowed with emotions, hopes and fears like those that Dante saw in Paradise.

Oude si movous a diversi porti
Per lo grau mar dell' essere, e ciascuno
Con istiuto a lei dato che la porti.

There indeed was the great sea of being, but all one vast whirlpool that engulfed the soul of the poor powderless "tenderfoot," while his ears were stunned with the whizz and rush of wings all around his head, with the thump and bustle and splash of ducks alighting in the water before him, with the squeal of wood ducks, the quack of mallards, the whistle of widgeon, the *scape* of traveling snipe, the grating squawk of herons, egrets and bitterns, the *honk-wonk* of geese, the *clank-a-lank* of brant, and the dolorous *grrrroooo* of the far-off sandhill cranes.

Thankful am I that so many Western readers have seen the full intensity of "the evening flight." For otherwise I should not have dared to tell half the truth.

NEW YORK FOREST COMMISSION.—Albany, July 14.—The Commissioners appointed by the Comptroller to investigate and report a system of forest preservation will meet at Saratoga on July 23. Owners of timber and forest lands, and all who are interested in the subject have been invited to attend. An erroneous opinion has got abroad that this Commission was appointed to look after the Adirondacks only. The act under which they were appointed applied to all the forest lands in the State.

"NESSMUK'S" POEMS.

Editor Forest and Stream:

As you see, I have changed my spot; left Indianapolis and "troops of friends" and have made a camp here—Denver. The fishing was getting very feeble in White River and Fall Creek. The dynamite fiend and the gentlemen with a seine have done the business, and so Major Arnold removed to San Antone and I came here. He is baiting catfish with paste made of Limburger cheese and oatmeal. He says "they come right out on the bank to get it," and while there he secures them; and I am waiting till Colorado law allows me to fish in the neighborhood of Wagon Wheel Gap. I shall have something to report.

I reckon climate will have something to do with the weight and number of the trout that I shall say I have taken strictly with a fly. When I am by myself I do not disdain a worm, a piece of pork cut in the fashion of a frog, or even a grasshopper. I am of a tolerant spirit, and am disposed to defer to the wishes of fish. All the same I own the lightest fly-rod in the State (four ounces), and when not entirely out of meat stick to it.

"Nessmuk's" little book came to hand. It is too little. I read it at one sitting, and cried for more. I have had some experience in camping and fire building and in cooking, all along from 1862 to late in 1865, and later in forest and by stream, and I thought I was an expert, but I welcome "Woodcraft." It is the best thing in its line ever put into covers. It is excellent from end to end. I recognize "the hatchet" and "the face."

I made the acquaintance of "Nessmuk" through your columns, and in the spring of 1882 I dropped him a line of inquiry as to the sport possible in the region of his home, Wellsboro, Pa. He answered promptly in that fine writing of his (he can get as much on a postal card as I can on a sheet), and one day in July thereafter I appeared to him. Found him at work on a boot. He rose from his seat, informed his brother that he should be absent a week or ten days, and took me over and introduced me to the canoe Susan Nipper, his first love. I have not seen Sairy Gamp, and when seen, I shall not ride in her—"she takes somethink," and too much for my weight.

Not soon will I forget the week we had in the neighborhood of Ansley's. I have nothing to say of the number of fish we brought in, although on occasion I can be poetic. We brought in enough. The camp and fire and cooking was as laid down in "Woodcraft." It was all too soon over, but I still see the face of my friend and hear "the whimper of the brook."

I am of an age that I carefully disguise except to my mother, but I have had no happier days than with "Nessmuk" in the little camp some ten miles or so from Ansley's, on a stream fished decently for a hundred years.

"Woodcraft" and FOREST AND STREAM have made us all in love with his practical prose. How I desire to see his poetry in "covers." Not simply for my own sake. I have sat on a log and read enough of it to make a book. I wish it made into a book for the sake of others like myself, who wish that a Robert Burns would reappear on this side of the Atlantic. Somebody who would sing the song of the men who must work and the women who must weep in the land of the free and the home of the brave. "Woodcraft," excellent as it is, is not the best and last of "Nessmuk." He has concealed about his person poems of hope and patience and outlook that would speak to us in mines and mills who have no month or week for "woodcraft." He is as skillful with the heart of man, its needs and cries, as he is with the ways and appetites of the residents of forest and stream. "Nessmuk" is not only a trained observer of the habits of our dumb relations but a sympathetic and a powerful interpreter of the needs of man, woman and child. Please now do for the people of mills and mines what you have done for the people of forest and stream. MYRON W. REED.

DENVER, Col.

FACTS AND FANCIES.

WHILE fishing for trout during the first week in June, in a pond near Umbagog Lake, I noticed a large white sea gull, such as winter on our northeast coast, on her nest, on an isolated rock about two feet above the water. Two pairs of gulls have had nests on two separate rocks in this pond during my past ten summers' observation. As I neared the rock the old bird left and perched 100 yards away. There were two eggs in the large and flat nest of moss. Size of hen's eggs, blotched with black on a light brown ground. Hearing a gentle cry or chirp, I supposed it was the mother expressing her anxiety, but on my guide assuring me it came from the egg, on applying my ear, found it even so. My surprise was lessened when I saw the end of a bill just protruding from the shell, though my guide assured me he had often heard the chirp of chicks before the shell was broken.

The same day there was heard by my friend on the same pond, the unmistakable call of a moose for her calf, 200 yards away. We were about two miles from Middle Dam. A lumber operator told me he knew of moose in that locality last winter, but dared not inform his choppers, as they would prefer hunting to chopping.

A citizen of Upton, at the mouth of the Cambridge where it enters Umbagog, told me that twice during the summer (having no fear of the law before his eyes) he left his house at 6 P. M., went up the Cambridge, and returned each time at 11 o'clock with a deer—hunted with a jack.

There are severals pairs of bald eagles nesting near Umbagog.

Saw a pair of sheldrakes (*M. merganser*), who have a nest in a hollow tree near to a pond two miles from Umbagog. They do all their fishing for themselves and family in Umbagog, a pickerel lake.

A few years since, a friend informed me he shot a sheldrake flying from the lake to his nest. On throwing him into his boat two live pickerel, about four inches long, dropped from his mouth. This shows how pickerel may be transported accidentally to waters where they are not wanted.

Umbagog, the lower lake of the chain of the head waters of the Androscoggin, while the Rangeley is at the head, was once a fine trout lake. Some one, out of spite so said, stocked it with pickerel, and they are abundant. Will they go up Rapid River and into Richardson's Lake, passing Middle Dam? A few have been taken during the past two years at the foot of the dam in Rapid River.

Land-locked salmon appear to suffer no detriment when associated with pickerel, as appears thus far in this State. But woe to the trout and to Maine's great attraction for the angler if ever pickerel enter Rangeley waters. Umbagog is partly in New Hampshire and partly in Maine. The New Hampshire Commissioners, against the opinion of the Maine Commissioners, have introduced black bass into Umbagog. How land-locked salmon and trout will thrive with black bass is an untried experiment in our waters.

Was glad to see by your paper that land-locked salmon had been introduced into Umbagog by way of Rapid River. A few years since, the members of the Oxford Club, who have a club house on Rapid River, deposited a few land-locked salmon in the same place.

A five-pound salmon has been taken in Umbagog. Either one of the above, or one that has come down from Rangeley, as many will unquestionably.

I notice "Major Verity's" comments on my comparison of his statements with others on the performance of shotguns. Not being a professional in Horse Guard affairs, made a needless mistake in titling him General, for there was no general nor minor statement in his facts. All were major.

I considered "Verity's" article the most reliable of the many articles on guns, and intended that my allusion to it should be so understood, and entirely complimentary.

In his line I have a case in point; perhaps an old one. If so omit it. A friend of mine visited a pond, early one autumn morning, for black ducks. The pond was thickly covered with them. He blazed away both barrels for a winrow. To his amazement the whole surface of the pond appeared to rise—ducks and surface. The mystery was soon solved; the pond was frozen over and the ducks' legs frozen in, and the live ducks lifted the whole frozen sheet of ice, taking the slaughtered with them. The sheet of ice made a few gyrations and started southward on a migratory tour. The gunner took the cars in pursuit and picked up the dead ducks as they fell out of the melting ice. He picked up 123. There was oakum over the powder.

The pond is in existence and will be shown in proof to any doubter. AUSTIN.

MAINE WATERS, July, 1884.

MOOSEHEAD LAKE NOTES.

AM back from my trouting trip to Maine. I never saw so many fish taken at Moosehead Lake and vicinity as this season, and I never saw such large ones before. I, individually, captured nothing over two pounds, but I took a companion with me and introduced him to Kineo for the first time, and he had to land a four-pounder. It takes these amateurs to hold the cards. A party brought in one night fourteen brook trout that weighed thirty-five pounds. At another time 160 trout that turned the scales (Fairbanks, not fish) at 128 pounds. Among the lot were two of five and quite a number of four and three-pounders. During the former seasons the fishing has been the greater part of the time on the west shore, but this year it seemed to be along the east shore.

The new Kineo House is almost completed and built in modern style, and contains over 200 rooms. What a pretty idea it would have been to have modelled it after a large log house, with as many piazzas, bay windows and as elaborate finish inside as you please, but to have its exterior in perfect sympathy with its surroundings. It's a big hotel, but great Kineo Rock, towering above it, looks none the less majestic in comparison.

The railroad is laid through to the lake, and is to be opened for passengers July 14. The black flies were not numerous this season, and the fisherman when out on the breezy lake suffered little annoyance.

There was fine fishing at Spencer Pond (off the bay of the same name) but there are only two spring holes, and the trout are small, seldom weighing over one and a half pounds each.

On account of the lack of birch bark there is a steadily increasing demand for canvas canoes, the frame and outlines are the same, and the canvas is said to reduce the weight at least one-fifth.

This lack of the historic birch canoe is a great pity, as to me it has remained one of the pleasantest sights about Kineo. The Indian guides, however, still stick to the birch, and as my old Aroostook guide, Tom Nichols, remarked, "Me not so hard up yet to use canvas."

Many fine large fish were taken at the East Outlet (Wilson's), and many more, but smaller, at Indian Pond, four miles down the Kennebec.

The success of enforcing the game and fish laws the past two years can very easily be seen. When box after box of trout could be forwarded to fish dealers in Boston it was an object to capture more than was needed for daily consumption at the hotels. But now all is changed, only fifty pounds is allowed each sportsman, and he must accompany the box in transportation. Each trout must also be over five inches in length, and I sincerely hope the time will come when the use of the fly will only be allowed in its capture.

With the increase of little steamboats on Moosehead Lake I think the guides are getting a trifle lazy. In former years a paddle to the head of the lake and back, forty miles, was considered nothing for a day's sport, but to cross the lake, ten miles, to-day is quite an effort with a few of the guides.

The weather was perfect for the enjoyment of fly-fishing, not a rain or wind storm for weeks past, and although the mercury ranged from 90 to 100 degrees, it was seldom uncomfortable. That box of fly ointment, made by the Bangor man, "which you sent me," was a great success.

On my return home I stopped off at Portsmouth, N. H., and visited the Isles of Shoals—it's just lovely out there ten miles from land. I am sorry I cannot forward you some photos of this year's trip, but it is the first time on record since its invention that I have visited the woods without my tourograph. I got it into my trunk, but on Mrs. S. remarking that "she believed I had photographed the Maine woods out of existence," I reluctantly took it out—a fellow does have to accommodate his wife once in a while, you know.

HARTFORD, Conn. T. S. STEELE.

INTERESTING FIGURES.

OUR esteemed Chicago contemporary, the *Current*, has been comparing the quantity of matter published in its columns with that of other periodicals. We copy its figures, giving also those of the FOREST AND STREAM. The typographical measurements of the several periodicals for six months past are as follows:

	Ems.		Words.
THE FOREST AND STREAM	6,250,000,	or about	2,500,000
The Current	3,710,000,	"	1,484,000
The Continent	3,171,000,	"	1,268,400
The Century	2,376,000,	"	950,400
Harper's Monthly	1,626,000,	"	650,400
The Atlantic	1,446,000,	"	578,400

The measurement is of the reading matter, exclusive of advertisements. The comparison is interesting. It shows that the FOREST AND STREAM has published more than the *Current* and the *Century* combined, nearly as much as the *Current*, *Harper's* and the *Atlantic* combined, and more than the *Century*, *Harper's* and the *Atlantic* combined. These figures are not at all surprising.

Camp Fire Flickerings.

"That reminds me."

126.

SEVERAL years ago at one of our military posts was a French half-breed guide and interpreter named Battiste. One day Battiste went down to the sutler's store and invested in a new Winchester rifle and a flask of fluid. The latter purchase having its usual effect, Battiste returned to the post feeling very happy. Not far off he saw a pig belonging to the Major; and thinking to try his new rifle, fired at it and mortally wounded it. The next day the Major said to him:

"Battiste, you killed my pig. I shall charge you $10 for it."

"Him dead?" inquired Battiste.

"Yes."

"Well, give him to me then, I eat him."

"Oh!" replied the Major, "I had him for breakfast."

"I no eat him I no pay you," said Battiste.

"I have charged you $10 on the book," said the Major, "and you will have to pay it." Whereat Battiste went off highly incensed, muttering, "By gar! I no eat him, I no pay him. I fix him."

In the winter the Major and Battiste were running buffalo, and the Major's horse jumped into a deep coulée which was filled with snow, and in the struggle to get out, the Major was buried under the horse, only his head being visible.

"Battiste, help!" cried the Major.

"Yes," said Battiste, advancing to the edge of the coulée, "I help you, you scratch out him peeg?"

"Yes, yes," cried the Major, I'll scratch him out."

"Ver good," said Battiste, "the old woman, you buy him dress?"

"Yes," said the Major, "come, hurry up."

"Yes, I help you," said Battiste, and he proceeded to extricate the Major from his unenviable position. J. W. S.

UPPER MARIAS RIVER, M. T.

127.

Some years ago H., one of our leading dealers in sporting goods and a jolly sportsman, told his friends that he had a way of loading his shells that prevented the shot from scattering over more space than could be covered by a man's hand.

"O, yes," replied R., a brother sportsman, "you hold the gun about six inches from the target; anybody can do that."

"No, you don't," says H., "you shoot at forty, fifty, sixty, or even a hundred yards."

Of course it was worth twenty-five cents to be the possessor of such a secret, and the money was handed over. After being told the "secret," R. looked very serious, and remarked: "I'll get even with you or revenge myself upon somebody else." For two whole days R. in turn wanted to "sell" the secret, but nobody seemed to care whether his shot scattered a mile or less. He even offered to give C. the information gratis. But no; C., who talks of nothing but his gun, was so rushed with business that he didn't even stop to say no. In despair R. cried after him, "You use only one pellet in a load!" When the boys gather in the shop now, H. is the only one who smiles when "How to load a gun" comes up before the meeting. FRITZ.

Natural History.

NOTES ON SHORE BIRDS.

WHILE recently perusing the list of the "Birds of Eastern Massachusetts," as found in "Maynard's Naturalists' Guide," I could but notice the difference between some of the notes there made and my own experience. I desire simply to notice the shore birds of interest to sportsmen, taking, as the first instance, the golden plover (*C. virginicus*). This species is given as "common spring and autumn migrant." Now during the past twenty years I have never seen one of these birds in the spring, nor did I ever hear of any save once (in the spring), and then it was a single bird from Cape Cod. Their appearance in the autumn is of course admitted.

The "beetle head" (*S. helvitica*) I have repeatedly seen in the spring; in fact I think they are seen and shot every season, though not in large numbers.

The turnstone, "chicken bird" (*S. interpres*) is stated to "frequent rocky shores." So they do, yet I think they are as often shot over decoys set in pond holes on the marshes.

The robin snipe (*M. griseus*) is given as "not uncommon during the migrations." This is one of the waders that I confidently look for any time after the 8th or 10th of July, and from then to and some seasons into September, though last season was an exception, it being decidedly an off year.

The purple sandpiper (*Arquatella maritima*) is given as "found on the coast during spring and autumn." I shot eight in the month of December some years ago, and saw a number of others. From this, and from the similar experience of a friend, I think they sometimes winter here. I never saw any in the spring.

The curlew sandpiper (*T. subarquata*), as stated, is rare, in fact a straggler from other shores. Two or three have been taken on the New England coast. I shot one at Ipswich in 1872.

Tringa canutus, or as here locally known "blue plover," is more, I think much more common in autumn than in the spring, though I have seen it at both seasons. It is not generally met with until the last of August, or better yet in September.

The red-backed sandpiper (*T. alpina americana*), one of the "grass birds," is rare in the spring but comparatively common in September or October, and perhaps later.

The pectoral sandpiper (*T. maculata*) is another and the commonest of the so-called "grass birds" from July 10 or 15, until quite late in the fall, but with us very rare in the spring. There seem to be two sizes of this species, and gunners commonly call them the "big" and "little grass birds."

The stilt sandpiper (*M. himantopus*), known about here as the "bastard yellow-leg," though why I do not know, as its legs are quite dark, is given as "very rare." This certainly differs from the experience of some others. As with all birds, there may be years when they are without apparent cause scarcer than usual, yet about every season when shooting shore birds I have taken them. I know of eight shot at a single discharge at Eagle Hill, Ipswich.

The white-rumped "peep" (*P. bonapartii*) is given as

"abundant." The same is also remarked of the common "peeps" (*A. semipalmata* and *minutilla*). The expression applies well to the last two species, but to the first, certainly not so well

The sanderling (*C. arenaria*) or "white beach bird," is common, though not as abundant as perhaps it was when Mr. Maynard first took notes. Twelve years ago I saw two baskets, each holding half a bushel, and rounded full of these birds that Lewis Stone, of Ispwich, shot between tides, down Plum Island River. I have never seen them like that since, though numbers of them doubtless are shot every season.

As to he willet (*Symphemia semipalmata*) or "humility," as we call it, scarce a season goes by without some being shot. I much doubt its being a "summer resident."

The winter yellow-leg (*G. melanoleuca*) is given as "arriving from the north nearly in August." I have shot them in July and all along until into November. Their appearance in the spring, about May, is, of course, understood.

The summer yellow-leg (*G. flavipes*) is mentioned as "summer resident, common during the migrations." I can name a dozen sportsmen who will corroborate me when I say this is a quite rare species to meet in the spring on our Eastern Massachusetts coast. By the middle of July, perhaps a little earlier, it may be expected confidently unless the off-year throws all plans out.

The solitary sandpiper (*R. solitarius*) is nowadays and near the coast a rather rare specimen at all seasons.

Of course, the spotted or "teeter" is one of the commonest, yet one almost always finds them scattered.

The upland plover, so called, (*T. bartramius*) is given as "not an uncommon summer resident." I have seen stray ones shot in the spring, but I think it is uncommon until the latter part of July and into August and the beginning of September, when some may be found almost any day, though to get them involves patient and persistent efforts, as they are pretty shy. They seem much less alarmed at the report of a gun than at sight of a man. As a rule, they will not decoy, still I have thus secured them.

The buff-breasted sandpiper (*Tryngites rufescens*) is a rare bird, as stated, but those I have seen have not been "found on the sandy shores," but the hills of Ipswich neck. Gunners generally called it the "hill grass bird," and to me it seems a fitting title.

The marbled godwit (*L. fedoa*) I never have seen alive, I mean so as to know it positively, but its capture as recorded by "Mr. H. B. Farley, at Ipswich, on July 17, 1869," is not at all unlikely.

The Hudsonian godwit (*L. hudsonica*), or "blacktail," is rare at all times, still I have shot it, and I think scattering birds are picked up about every season. I never knew of one in the "spring."

Of the curlews, the "old sicklebill," or hen curlew (*N. longirostris*) is, and has been for years, the rarest. The jack curlew (*N. hudsonicus*) is much more common, though scattering birds only are shot, as they seem to be bound right along when passing south in July.

The "dough bird" (*N. borealis*), though the latest is generally the most common. Sometimes in August and in September they are found quite numerous, and often in company with the so-called "blackbreasters" (*C. virginicus*) on the hills of Ipswich and Essex, and again on Cape Cod.

Of the phalaropes, or, as sometimes named, the "web-footed peeps," I have taken two species, (*P. fulicarius*) while on a fishing vessel well out in Massachusetts Bay, and (*L. hyperboreus*) at Swampscott over decoys. I have known of a few others, but they do as stated, "keep off the coast."

Various questions might profitably be discussed while criticising this "List." They are about all within the limits of that very important matter to ornithologists and sportsmen too, the geographical distribution of species, a subject upon which much light may be thrown by observations and data yearly—yes, often daily—collected, and jotted down with but very little trouble. These data placed in the hands of some competent person, like Dr. Coues or Mr. Ridgway, of the Smithsonian, and in a little while we should be able to see appearing in our FOREST AND STREAM some of the results, and I am confident we should learn facts full of interest and now all too obscure. Before closing these remarks let me say it is indeed surprising to see how little real knowledge is possessed by the average sportsman, about even the commonest species. It seems to be enough for him to know a goose from a duck, a snipe from a woodcock, and a few other equally plain things. If my brother Nimrods would try and book up a little I am quite sure it would not detract from their sport (it never has from mine); and then we should, by interesting this large and important class, save valuable birds which now go to the larder and oblivion.

HOW YOUNG BIRDS ARE FED.

Editor Forest and Stream:

It may be interesting to many of your readers to know more about the family cares of our birds. In order to find out how often young martins are fed by their parents, and at what times the principal meals are served, I watched my sixteen feeding pairs during an entire day, June 24, from 4 A. M. till 8 P. M., marking every visit of the feeding parents, males and females, separately.

The martins began hunting at 4:15, but no food was brought until 4:30.

The accompanying table shows that our young martins had to put up with a light breakfast, but the visits became more and more frequent as the sun and mercury climbed up, and reached their liveliest time between 9 and 10 A. M., *i. e.*, lunch time. After that a lull was noticeable, broken only by an approaching storm, which brought new life into the feeding business, but for a short time only, and to be reduced to a minimum during the light rain, 1:25 to 2:45. Even after the rain had ceased little feeding was done until the sky begun to clear up and the sun reappeared.

From that moment the number of visits swelled with great rapidity, and kept me hard at work for over an hour. It was the most substantial meal of the day, and the young martins may well call it their dinner.

After this the parents took a well-deserved rest, but when the sun neared the horizon they were all off again, preparing for supper, which was not so hearty as one might expect.

As a rule, the older the birds in the nest, the oftener they are fed, and from the size of the insect which the parents bring, the age of the young may be judged.

The youngest birds are fed at longer intervals with crushed insects, mostly small beetles, from the craw. About a fortnight old, they are fed from the bill with soft insects of the size of large flies; but insects with stings, such as bees and wasps, are never brought. When four weeks old, large dragonflies, grasshoppers and butterflies make the principal food.

The young martins do not leave their box until they are six weeks old.

The table itself needs no further explanation, except that the occupants of the sixteen boxes were of all ages, from one week old in No. 6 to five weeks old in Nos. 12, 16, 17.

The number of hungry mouths has something to do with the frequency of the visits. No. 7, which heads the list, has four young ones (four weeks old), while most of the other boxes have three. No. 16 has only two. O. WIDMANN.

ST. LOUIS, Mo.

THE ARIZONA QUAIL.

Editor Forest and Stream:

In your issue of June 12, I find an inquiry from Mr. J. B. Battelle, of Toledo, Ohio, relative to the Arizona quail I promised to send him and others. In reply I offer this explanation of the delay. My first proposition was to send the quail in September or October, when they become plentiful in our market here, but in reply to the various letters addressed me on the subject, and the expressed desire to have the quail with as little delay as possible, I concluded to get them elsewhere and forward them to their admirers in time for them to test their breeding and domesticating qualities during the present season. With that end in view I sent to a friend at Fort Yuma for two dozen, to be expressed to me here. This was in March. He replied that on account of the lateness of the season the birds would be difficult to procure, inasmuch as they were mating and consequently were shy of approach. He, however, sent me one dozen, which, in addition to two pair I already had, made up two-thirds of the number I purposed to send away. Unfortunately my cage room was somewhat limited, so I put the dozen strangers into the cage with one of my domesticated pairs. Business engagements called me away for a week, and on my return I found that the pugnacious little rascals had been systematically killing one another off. I took eight birds out of the cage at one time, some dead and others so badly pecked up that I killed them for humanity's sake. That left me so few, and as others were not procurable, I decided upon letting the matter rest until the fall birds came in. Recently, again they have been fighting, and one of the finest of the males has been so badly used up that I do not think he will live. I have one pair in a cage alone, and from them I expect a brood of little ones. The others are laying eggs all over their coop floor. Many of them have been broken. I have, however, just taken out ten good ones. The bulk of the remaining birds are females, consequently it would now be impossible for me to pair them for distribution. I can send two dozen in a cage by express for almost the price that half the number would cost, the weight of the cage being practically the same, and this on cost is quite a saving item. However, let those to whom I promised the birds do as Mr. Battelle has done, deposit the cost of the expressage with the FOREST AND STREAM and I will see that in due time they get their birds. It will be necessary for me to prepay the charges here, consequently by the deposit being made it will secure me against possible loss. I had a letter for eggs, but as I have mislaid the address I cannot forward them to the applicant. I trust that this explanation of the delay will prove satisfactory, for all may rest assured that they will get their birds. ADIOS.

TUCSON, Arizona.

[As suggested by "Adios," it may be well for those who are anxious to have quail of the first shipment to send the money to prepay express and boxing charges to us here. One gentleman has already sent us $4 for this purpose, which will be ample if enough birds are sent and they reach here in good condition. The expenses will be equally divided among those receiving birds, and if any balance remains over it will be returned to the sender.]

THE OAK WOODS SPARROW.

(*Peucæa æstivalis illinoensis*).

BY G. H. RAGSDALE.

I DEVOTED June 2 and 3 especially to a search for the oak woods sparrow, and traveled some fifteen miles through timber that seemed to invite them, but not a *Peucæa* was seen or heard.

On June 24, I started on what might prove another wild goose chase after *Vireo atricapillus*. Having ridden on horseback nine miles through intense heat, I turned from the prairie and rode into a woodland to rest and listen for *Peucæa*. I had not penetrated the wood a quarter of a mile before my ear caught an indistinct sound, which caused me to suddenly draw rein; nothing more was heard for some minutes, but I saw a brown sparrow light in a bush, at which I fired and missed. Tying my pony, I followed the course indicated by the bird's flight till I came upon a flock of sparrows, and fired at a supposed oak woods and killed a field sparrow (*Spizella pusilla*). I began to think I had only heard this bird, but as the locality looked so favorable, I concluded to put in an hour especially to determine whether the birds were present.

Stretching myself on the green sward in the shade of a post oak, I dreamed away about half the allotted time, when the faint, ventriloquial note of *Peucæa æstivalis illinoensis* was distinctly heard. I was wide awake now, and used my utmost strategy to approach the music box, but at the end of half an hour the note had entirely ceased and I had not even seen a feather. Calling Prince, I put him into the grass and tried to tramp up the bird, but it was no go. It was now high noon, and but few birds of any kind were to be heard. The field sparrows occasionally rested from feeding their young and uttered a trill, and some tits (*L. bicolor*) were scrambling after their dinner in an elm, but with this exception it might have been presumed that no other birds were near. As I had not seen one of the looked for birds since 1879, I was loth to give up the chase and sat down and waited. At length I gave up the hope of getting a specimen on this trip, and I returned to my horse and was in the act of mounting, when I heard a song quite close at hand. On advancing directly toward the sound I caught sight of the bird on a dead branch of an oak tree and shot it without its having heard or seen me, as I was screened by another tree. It was a nice specimen and not badly mutilated, but showed the worn dress. It was now 2 o'clock, but I felt well paid as I mounted and started in a hurry after blackcaps, but before I had proceeded a hundred paces I heard another song and gave chase. As I approached the bird would take short flights directly from me, and thereby be screened by the tree in which it was singing; finally I saw it fly and marked the limb it perched upon and secured it. I now "went on my way rejoicing."

GAINESVILLE, TEXAS.

FRIENDLY SQUIRRELS.

WHILE fishing in Spencer Bay, Moosehead Lake, Me., one day this summer, a red squirrel was seen swimming on the water. It soon discovered me and, swimming to the side of the canoe, made two ineffectual attempts to jump aboard, but fell back into the water. My guide then held out his paddle, on to which the animal jumped and gained a safe foothold on the boat. He ran about the canoe, climbed over my shoulder, and finally perched himself at the bow, and with blinking eyes attempted to understand his traveling companions. Having at last satisfied his curiosity, he again passed over my shoulder to the stern of the boat and jumped off into the water, raised his bushy tail for a sail and swam ashore. A similar incident happened to another canoe a few days previous, the variety of which was increased by a party in a second canoe appearing and offering the squirrel a Kineo House doughnut, which, strange to relate, the animal devoured with avidity. On reaching the steamer which was awaiting the party off their fishing grounds, the squirrel jumped aboard, ran forward and climbed the flagstaff at the bows and remained seated on the golden ball top until it reached Kineo dock, when it disappeared in the woods. T. S. STEELE.

HOOP SNAKE IDIOCY.—The editorial hoop snake is rolling on. It was last seen in Virginia: "A green snake was found by a couple of gentlemen in the Roanoke Valley writhing and twisting at the foot of a beech tree. It proved to be a horned hoop snake, which in rolling down hill after some game, had struck the tree with such force as to drive the horn an inch into the solid wood."

WHAT THEY DID.

HANK WILDS.

Hank Wilds, of Chico, and a man by the name of Nelson, have been on an extended bear hunt near Berdan's. While walking along the mining ditch of Holben Brothers they discovered a bruin upon the hillside, and Wildes took a shot at him. This infuriated the bear and he started in the direction of the men. Nelson dropped his gun and told his partner not to shoot again as the bear was coming that way, and skipped out across the ditch and down a twenty-seven-foot embankment. Nelson did not stop until he reached Holben's camp, where he informed the boys of what had happened. They went to the relief of Wildes, and as they reached the place where Nelson left his partner they discovered the latter gentleman about a quarter of a mile distant in the top of a "sturdy oak." They called to him to come down, when he made a statement that the bear weighed 1,500 pounds, and that it had chased him to the tree in which he was found. The bear was found only a short distance below, but it was only a cub.—*Chico (Cal.) Chronicle.*

JOHN GRAY.

Mr. John Gray has had a steel strap set for bears in the gorge below the falls. Last week upon reaching the trap he was confronted by an immense black bear that had been caught by the foot, and was making a fearful racket among the rhododendrons in trying to liberate itself. Mr. Gray was armed with a small shotgun loaded with bird shot. With this he banged away at the bear, which, at the report of the gun, broke away with the trap, chain and all, and tumbled over a cliff fully fifty feet high, falling into the top of a spruce pine, from which Mr. Gray found it impossible to dislodge it, and he was forced to go ten miles down the river, where he collected a crowd of men, and upon returning the bear was found still in the tree, having been unable to descend with the steel trap. The bear was killed, and was found to weigh 400 pounds—one of the largest black bears that has been killed in this county for years.—*Morganton (N. C.) Mountaineer.*

STEVE MEEK.

We were visited last week by Steve Meek, the pioneer hunter and trapper of California. Mr. Meek first set foot on California soil in 1832. He remained here but a short time and then hunted and trapped in the Rocky Mountains, returning to California in 1836, where he piloted the first emigrant train through to Oregon. He is now 79 years of age, and is afflicted with rheumatism, but the luster of the old man's eyes show considerable vitality yet. His mind is as strong as ever, and he remembers clearly events occurring 50 years ago. Like most California pioneers, he is not overburdened with this world's goods, and should receive a pension as a means of sustenance. He resides in Fort Jones with his son.—*Reading (Cal.) Democrat, June 25.*

BILL ADAIR.

Mr. Bill Adair killed another deer on Monday. Bill is beating all of the boys, but they say he deserves no credit for the last one as the deer was foolish enough to come up in sight of the depot and stand there until Adair came up and killed it.—*Goldman (Ark.) Prairie Farmer.*

Game Bag and Gun.

OPEN SEASONS FOR GAME AND FISH.

REVISED TO JULY 17, 1884.

General Provisions.

IT *is unlawful:* To kill, have in possession, transport or sell game birds, animals and fish, save only in the open season for each given herein; to net or snare game birds or animals; to take or kill game fishes by any other means than angling; to shoot waterfowl at night, or with any other than shoulder-guns; to hunt rabbits with ferrets; to enter inclosed land for shooting without consent of owner; to kill (except for scientific purpose) insectivorous or song birds at any time, or to rob nests of wild birds (except birds of prey).

Laws forbidding export of game obtain in Colorado, Connecticut, Dakota, Delaware, Indiana, Michigan, Minnesota, Missouri, Nebraska, New York, North Carolina, Wisconsin, Ontario, Wyoming.

Discriminations against non-residents obtain in Delaware, Iowa, Missouri, New Brunswick, New Jersey, North Carolina, Nova Scotia, Quebec, Tennessee.

☞ *The dates given are those between which the game and fish named may be lawfully taken.*

British Columbia.

Deer, elk, reindeer, caribou, hare, Sept. 1-Jan. 10. Grouse, partridge, prairie fowl, quail, snipe, robin, meadow lark, Sept. 1-Feb. 1. Wild duck, Sept. 1-March 1. Pheasant protected to Sept. 1, 1886.

Connecticut.

Ruffed grouse, quail and woodcock, Oct. 1-Jan. 1. Wildfowl, Sept. 1-May 1. Rail, Sept. 12-Jan. 1 (in New Haven, Fairfield and Litchfield counties, Aug. 20-Jan. 1). Game exportation forbidden. Wildfowl may be shot only with gun "such as is commonly raised at arm's length;" shooting from sailing or steam vessel, or sink-box on feeding ground, forbidden.

Speckled trout, April 1-July 1. Unlawful to net pike, pickerel, black bass, mascalonge. Local fish laws govern certain waters.

Delaware.

Partridge, quail, pheasant, ruffed grouse, woodcock, hare, rabbit, in Kent and Sussex counties, Nov. 15-Jan. 15; in New Castle county, Nov. 15-Jan. 1. Ortolan, reedbird, rail, Sept. 1-Jan. 1. Pinnated grouse (prairie chicken) protected to 1886.

Birds and rabbits may be killed by any person on his own land at any time. Entrance upon land for shooting without owner's consent, forbidden. Non-residents must become members of the Delaware Game Protective Association, fee, $5 first year, $2 per year thereafter. Secretary, George Churchman, Wilmington, Del. Sunday shooting forbidden. License (fee $50) required to export game for market. License (fee $25) required for buying game to sell again.

Indiana.

Ruffed grouse and quail, Oct. 15-Dec. 20. Woodcock, July 1-Jan. 1. Wildfowl, Sept. 1-April 15. Pinnated grouse, Sept. 1-Feb. 1. Wild turkey, Nov. 1-Feb. 1. Deer, Oct. 1-Jan. 1.

Exportation of deer, "quail, pheasant, wild duck, grouse, prairie chicken or woodcock," forbidden.

Maine.

Moose, deer and caribou, Oct. 1-Jan. 1 (forbidden to hunt with dogs), unlawful for one person to take more than one moose, two caribou or three deer in one season. Mink, beaver, sable, otter, fisher, muskrat, Oct. 15-May 1. Wood duck, dusky, black or other sea duck, Sept. 1-May 1. Wildfowl law does not apply to seacoast. Ruffed grouse (partridge), woodcock, Sept. 1-Dec. 1; pinnated grouse, Sept. 1-Jan. 1; plover, Aug. 1-May 1. Woodcock and ruffed grouse may be killed only for consumption within the State. Sunday shooting forbidden.

Salmon, April 1-Sept. 15; netting salmon permitted only from April 1-July 15. Angling for salmon within 100 yards of a fishway, dam or mill race, forbidden. Smelts, April 1-Oct. 1. Black bass, Oswego bass, white perch, July 1-April 1. Land-locked salmon, trout, togue, May 1-Oct. 1; in St. Croix River and tributaries, and all waters in Kennebec county, May 1-Sept. 15; during months of February, March and April it is lawful for citizens to take "and convey the same to their homes, but not otherwise." Unlawful to take land-locked salmon less than 9 inches in length, or trout less than 5 inches; or take, transport or have in possession for transportation more than fifty pounds of land-locked salmon or trout, or both. Unlawful to take these fish in Kennebago, Mollychunkamunk, Cupsuptic, Mooselucmaguntic and Welokennebacook lakes and tributaries, between Feb. 1 and May 1; unlawful in said waters to use spawn bait in September. Unlawful to take trout or land-locked salmon in the Rangeley stream, between the mouth of Kennebago stream and Howard's dam, from July 1-May 1, or at the South Bog stream from July 1-May 1, or in the Bemis stream from July 1-May 1, or in the Cupsuptic stream from July 1-May 1, or in the Kennebago stream between the foot of the first falls, near its junction with the Rangeley stream and the upper falls at the outlet of Kennebago Lake, from Sept. 1-May 1.

The Commissioners of Fisheries and Game are E. M. Stilwell, Bangor; H. O. Stanley, Dixfield. A digest of the laws may be had on application to them.

Manitoba.

Deer, cabri, or antelope, elk or wapiti, moose, reindeer or caribou, Oct. 1-Jan. 1. Ruffed grouse, pheasants, partridges, prairie chickens, Sept. 1-Jan. 1. Woodcock, plover, snipe, and sandpipers, Aug. 1-Jan. 1. All kinds of wild duck, sea duck, pigeon, teal, wild swan, or wild goose, except the variety of wild goose commonly known as the snow goose or the wavy, Aug. 15-May 1. Otter, fisher or pekan, beaver, muskrat and sable, Oct. 1-May 15. Mink and marten, Nov. 1-April 15. Exportation of game forbidden; consent of land-owner required before entering premises for hunting. To collect birds, etc., for scientific purposes, certificate must be obtained from Minister of Agriculture.

Michigan.

Deer, in Lower Peninsula, Oct. 1-Dec. 1; Upper Peninsula, Aug. 15-Nov. 15. Forbidden to kill deer in red coat or fawn in spotted coat, to kill in water or by pit, pitfall or trap. Elk protected to 1889. Ruffed grouse, Sept. 1-Jan. 1. Quail, Nov. 1-Jan. 1. Woodcock, Aug. 1-Jan. 1. Pinnated grouse, Sept. 1-Nov. 1. Wild turkey, Oct. 1-Jan. 1. Wildfowl, Sept. 1-May 1. (Wood, mallard, teal and gray ducks, Sept. 1-Jan. 1.) Snipe, Sept. 1-May 1. Swivel or punt gun and night-shooting wildfowl forbidden. Wild pigeons protected in vicinity (five miles) of nesting. Exportation of deer, ruffed grouse, quail, prairie chicken, wild turkey, forbidden.

Speckled trout, May 1-Sept. 1. Grayling, June 1-Nov. 1. Forbidden to take trout from stream within three years after it has been stocked, to catch grayling or brook trout of less than 6 inches length, to take California trout prior to June, 1885. Special laws govern certain waters.

The State society is the Michigan Sportsmen's Association, Secretary, S. A. Rogers, Jackson.

Missouri.

Ruffed grouse and quail, Oct. 15-Feb. 1. Woodcock, July 1-Jan. 10. Pinnated grouse, Aug. 15-Feb. 1. Wild turkey, Sept. 15-March 1. Deer, Sept. 1-Jan. 15. Plover, dove, meadow lark, Aug. 1-Feb. 1.

Unlawful for non-residents to kill game for exportation from State.

New Hampshire.

Plover, yellow-legs, sandpipers, woodcock, ducks and rail, Aug. 1-Feb. 1. Ruffed grouse, partridge, quail, Sept. 1-Feb. 1. Deer, moose and caribou, Sept. 1-Dec. 1. Mink, beaver, sable, otter, fisher, Oct. 15-April 1. Raccoon (coon), gray squirrel, Sept. 1-Jan. 1. Hare, rabbit, muskrat, Sept. 1-April 1.

Land-locked or fresh-water salmon, lake trout, brook or speckled trout (none less than four inches), April 30-Sept. 30. (Lake trout may also be taken "with single hook and line only," Jan. 1-April 30). Pike-perch, white perch, July 1-May 1. Black bass, June 15-April 30. Muskallonge, pickerel, pike, grayling, June 1-April 1. Forbidden to take striped bass of less than fifteen inches length. Fish introduced by Commissioners protected for five years.

Fish and Game Commissioners: George W. Riddle, Manchester; Elliot B. Hodge, Plymouth; Luther Hayes, South Milton.

New Jersey.

Ruffed grouse and quail, Nov. 1-Jan. 1. Woodcock, July 1-Aug. 1, and Oct. 1-Dec 16. Pinnated grouse, Oct. 15-Dec. 1. Deer, Oct. 15-Dec. 1. Rail, Sept. 1-Dec. 1. Reedbird (marsh hen) Aug. 25-Dec. 1. Upland plover, Aug. 1-Jan. 1. Summer duck, Sept. 1-Jan. 1. Squirrels, Sept. 1-Jan. 1. Rabbit, Nov. 1-Jan. 1.

Salmon trout, March 1-Oct. 1. Brook trout, March 1-Oct. 1. Black bass, June 1-Nov. 1.

Non-residents must become members of a game protective society of the State to shoot or fish within its borders, under a penalty of $50. New Jersey Game and Fish Protective Society has jurisdiction over entire State. Fee, $2 annually. Secretary, Wm. L. Force, Plainfield, N. J. Or, non-residents to shoot or fish in Camden, Gloucester, Atlantic, Salem, Cumberland and Cape May counties, may obtain membership certificate of West Jersey Game Protective Society. Fee, $5 first year, $3 annually thereafter. Secretary, Wm. T. Miller, 106 Market street, Camden, N. J.

New York.

Ruffed and pinnated grouse, Sept. 1-Jan. 1. Quail, Nov. 1-Jan. 1. Woodcock, Aug. 1-Jan. 1 (Oneida, Dutchess and Delaware counties, Sept. 1-Jan. 1). Wildfowl, Sept. 1-May 1 (in Long Island waters, Oct. 1-May 1); use of guns, except such as are habitually fired from the shoulder, shooting from sailing or steam vessels (excepted localities), use of battery or machine, decoys or bough houses at greater distance than twenty rods from shore (excepted localities), blind, net, snare or trap, unlawful. Deer, Aug. 1-Dec. 1; hounding, Aug. 15-Nov. 1, forbidden at all times in St. Lawrence county. Unlawful to crust, to kill by trap or spring gun, or to kill fawn in spotted coat. Robin, meadow lark, starling, Oct. 1-Jan. 1. Rabbit (hare), Nov. 1-Feb. 1; use of ferrets unlawful. Squirrel, Aug. 1-Feb. 1.

Speckled trout, April 1-Sept. 1. California trout, Sept. 1-May 15. Black bass, Oswego bass, June 1-Jan. 1; in Lake Mahopac, Dutchess county, Schroon Lake and River, Paradox Lake, July 16-Jan. 1; Lake George, July 20-Jan. 1. Salmon (or lake) trout, April 1-Oct. 1; in Lake George, May 1-Oct. 1. Forbidden to take striped bass of less than one-half pound weight. Unlawful to catch any fish within eighty rods of fishway.

Sunday shooting and fishing forbidden. Unlawful to export game from Dutchess and Rockland counties. Non-residents must pay $10 license fee to shoot in Richmond county (Staten Island). Forbidden to shoot for market in Niagara county.

Game protectors—See list elsewhere.

Pennsylvania.

Ruffed and pinnated grouse, Oct. 1-Jan. 1. Quail, Oct. 15-Jan. 1. Woodcock, July 4-Jan. 1. Wildfowl, Sept. 1-Jan. 1; on Mondays, Wednesdays and Fridays of each week only; shooting from steam or sailing craft forbidden, also netting and use of "other than such guns as habitually are raised at arm's length and fired from the shoulder." Wild turkey, Oct. 15-Jan. 1. Deer and elk, Oct. 1-Dec. 15; transportation allowed only Oct. 1-Nov. 30; forbidden to kill fawn in spotted coat, or to pursue or kill elk or deer in the water, or to chase them with dogs. Plover, July 15-Jan. 1. Rabbit (hare), Nov. 1-Jan. 1. Rail and reedbird, Sept. 1-Dec. 1. Grouse shooting at night unlawful. Wild pigeons protected on nesting ground. Sunday shooting and fishing unlawful.

Salmon, speckled trout, April 1-Aug. 1. Lake trout, Jan. 1-Oct. 1. Black bass, June 1-Jan. 1. Green bass, yellow bass, willow bass, rock bass, Lake Erie or grass bass, pike or pickerel, or wall-eyed pike, commonly called Susquehanna salmon, June 1-Jan. 1; does not apply to Lake Erie waters, save ponds on Erie Harbor peninsula. Speckled or California trout may not be taken less than five inches in length, nor black, yellow or green bass less than six inches in length.

Pike County: Deer, Oct. 1-Dec. 1; cannot be killed in the water. Squirrel, Sept. 1-Dec. 15. Rabbit, Oct. 15 to Dec. 15. Wood or summer duck, Oct. 1-Jan. 1. Woodcock, July 4-Dec. 15. Quail, Oct. 15-Dec. 1. Ruffed grouse, Sept. 15-Dec. 15. Salmon, speckled trout, May 1-Aug. 1. Pike, pickerel, June 1-Feb. 15.

Quebec.

Moose and deer, Sept. 1-Feb. 1 (female moose may not be killed before Oct. 15, 1888). Caribou, Sept. 1-March 1. Non-residents (except with permit) forbidden to take in one season more than 2 moose, 3 deer, or 2 caribou. Beaver, mink, otter, marten or pekan, Nov. 1-April 1. Hare, Sept. 1-March 1. Muskrat (in Maskinonge, Yamaska, Richelieu and Berthier counties), April 1-May 1. Woodcock, partridge and snipe, Sept. 1-Feb. 1. Black duck, teal and wild duck of any kind, Sept. 1-May 1. Migratory quail protected to Dec. 31, 1886.

Non-residents.—"No person who is not domiciled in the province of Quebec nor in that of Ontario, can at any time hunt in this province . . . without being authorized thereto by license to that effect. Such permit may, on payment of a fee of twenty dollars, be granted by the Commissioner of Crown Lands to any person . . . and is valid for a whole shooting season." Permits may also be granted to non-residents to take specimens for scientific purposes.

Salmon, May 1-Sept. 1. Speckled trout, Dec. 31-Oct. 1. Lake (salmon) trout, Dec. 1-Oct. 15. Black bass, mascalonge and pickerel, May 15-April 15.

Canadian Non-Export Law.

"The export of deer, wild turkeys and quail in the carcass or parts thereof, is hereby declared unlawful and prohibited, and any person exporting or attempting to export any such articles, shall, for each such offense, incur a penalty of $100, and the articles so attempted to be exported shall be forfeited, and may, on reasonable cause of suspicion of intention to export the same, be seized by any officer of customs, and if such intention be proved, shall be dealt with as for breach of the customs laws."—*Customs Act*, 1883.

Wisconsin.

Ruffed, sharptail and pinnated grouse and quail, wood duck, mallard and teal, Aug. 15-Jan. 1. Woodcock, July 10-Jan 1. Deer, Nov. 1-Dec. 15. Fire-shooting deer, chasing with dogs and exportation forbidden; also wildfowl shooting with "other than a gun habitually raised at arm's length and discharged from the shoulder," or by float, sneak boat, sail or steamboat. Otter, mink, muskrat, fisher, Nov. 1-May 1.

Speckled trout, April 15-Aug. 15. Black bass, wall-eyed pike, May 1-Feb. 1.

NEW YORK GAME PROTECTORS.

Editor Forest and Stream:

In answer to your note of inquiry about changes in the corps of game protectors, I inclose you a list of the protectors and of their respective districts as reorganized by the Commissioners of Fisheries at their meeting at Albany in May last, viz.:

First District. Counties of Suffolk, Queens, Kings and Richmond — George W. Whitaker, Southampton, Suffolk county.

Second. New York, Rockland and Orange—Joseph H. Godwin, Jr., Kings Bridge, New York.

Third. Westchester, Putnam, Dutchess, Columbia, Greene and Ulster—Matthew Kennedy, Hudson, Columbia county.

Fourth. Albany, Schenectady, Schoharie, Delaware and Sullivan—Francisco Wood, Schoharie, Schoharie county.

Fifth. Rensselaer, Washington, Warren, Saratoga and the town of Indian Lake, in Hamilton—Seymour C. Armstrong, Weavertown, Warren county.

Sixth. Essex, Clinton and all of the town of Long Lake in Hamilton except that part lying west of the east line of great lots Nos. 4, 5, 41 and 42—John Liberty, Elizabethtown, Essex county.

Seventh. St. Lawrence and Franklin—Peter R. Leonard, Ogdensburg.

Eighth. Montgomery, Fulton and the towns of Benson, Hope, Wells, Lake Pleasant, Arietta and Morehouse, except that portion of Morehouse and Arritta lying north of the south branch of Moose River—Thomas Bradley, Rockwood, Fulton county.

Ninth. All that part of Lewis lying east of the Black River and of the west lines of the towns of Diana and Croghan, all that part of Wilmurt, Herkimer county, and of Morehouse and Arietta, in Hamilton, lying north of the south branch of Moose River, and all that part of Long Lake, in Hamilton, lying west of the east line of great lots Nos. 4, 5, 41 and 42—John L. Brinckerhoff, post-office address, Old Forge, Herkimer county, or Boonville, Oneida county.

Tenth. All that part of Oneida lying north of the south line of Verona, Rome, Marcy and Deerfield, all of the county of Lewis lying west of the Black River and west of the west lines of Diana and Croghan, and all of the county of Herkimer lying south of the south branch of Moose River—Nathan C. Phelps, Remsen, Oneida county.

Eleventh. The counties of Otsego, Chenango, Broome, Cortland and Tioga, and all the towns of Oneida county lying south of the south lines of the towns of Verona, Rome, Marcy and Deerfield—Frederick P. Drew, Washington Mills, Oneida county.

Twelfth. Jefferson and Oswego—Wm. N. Steele, Clayton, Jefferson county.

Thirteenth. Madison, Onondaga, Cayuga, Wayne, Seneca, and the waters of Oneida Lake in Oswego—Wm. H. Lindsey, Canastota, Madison county.

Fourteenth. Schuyler, Yates, Chemung, Tompkins, Steuben and Allegany—A. N. Parish, Reading, Schuyler county.

Fifteenth. Monroe, Livingston, Ontario, Wyoming, Genesee and Orleans—Geo. M. Schwarts, Rochester, Monroe county.

Sixteenth. Erie, Niagara, Chautauqua and Cattaraugus—Stephen A. Roberts, Buffalo, Erie county.

The new arrangement of districts was made especially to afford greater protection to the deer districts in the Northern Wilderness, and to the waters of the St. Lawrence River.

Six protectors were detailed for service in the deer districts the present season, and the results of their services thus far have been very gratifying. In June eight violaters were detected by Protector Brinckerhoff in the Upper Moose River and Independence waters, where heretofore the poachers have defied law. Protector Leonard, of the St. Lawrence district, has had equal success on his beat. Protector Armstrong, of Warren county, reports that the law was never so closely observed in his district as it is now, and good results are reported also by Protectors Liberty, of Essex, and Phelps, of Northern Oneida.

The waters of the St. Lawrence and of Oneida and Seneca lakes have been swept of nets and other unlawful devices, and it may be safely said that there is, on account of the good organization of the protector system, a more general and vigilant enforcement of the game laws than ever before existed in the State.

R. U. SHERMAN,
Sec'y N. Y. State Com. of Fisheries.

OFFICE OF THE SECRETARY, New Hartford, N. Y., July 10.

TWO-EYED SHOOTING.

Editor Forest and Stream:

I have no fine-spun memories on the subject of one-eyed and two-eyed shooting, but for myself, I wish I had never heard of sighting down the barrel.

Any one shooting in the woods who shuts one eye is liable to put the whole load in a limb or a sapling that he didn't see when he pulled trigger; whereas, with both eyes open he would have seen the bird and all intervening objects. Again, if he aims with one eye at a bird coming overhead, the shot will pass under and behind the bird; and this must be so, because the line of fire and the line of flight are in opposite directions. Obviously then, the only way, except by chance, to hit a bird as he flies head on is to aim in front, and this can only be done with accuracy with both eyes open, as anybody may see who will try the experiment. This is also true of cross shots. 49.

VIRGINIA.

THE THREE-DAYS DUCKING LAW.

Editor Forest and Stream:

The most encouraging reports are coming in concerning the quantity and quality of game for the coming fall shooting. Quail and pheasants have wintered finely and are doing well, ducks will be found in the proper localities in abundance, and rabbits are now, as they long have been, predominantly on the increase.

In a recent number of your journal, a correspondent speaks in the highest praise of the "every-other-day" law, regulating the shooting of ducks. Is it not in reality an absurdity tending to disgust, rather than to give satisfaction to the duck hunter, especially to him who travels a long distance and has but a limited time in which to enjoy the pleasure of duck shooting? As an illustration of the fallacy of this law, suppose a city individual whose duties are of such a nature as to render his time extremely limited, manages to lock his safe, don his shooting suit, and joyfully depart for the duck pond or marsh for a week's enjoyment. Arriving there probably on Monday, he awakes to an awful realization of the fact that out of six days set apart by him for duck shooting, three, at least, and probably four days, are irretrievably lost. Yet his board bill and other incidental expenses run on with alarming regularity. Ducks may be, as they often are when you expect them otherwise, conspicuous by their absence, the weather may be in any other state than propitious for duck shooting, etc. Now let me ask the indulgent readers of FOREST AND STREAM whether such a law has not a greater tendency to weaken rather than to

strengthen the moral observation of Pennsylvania's game laws. Is it not a vice rather than a virtue? I would be pleased to hear the opinions of others on this subject. Individually, I unblushingly say that I bear no love for the man who was instrumental in the bill making this law.

C. A. R.

PITTSBURGH, Pa., July 10.

BEARS.—Many bears have shown themselves this summer in the woods and mountains of Bethel, Sullivan county, Pa. Near Black Lake in that region five or six were seen by gentlemen from your city who lately visited this section to arrange for summer quarters for their families. While on a tramp through the woods Messrs. R. and S. came to a large tract of low land with a great deal of fallen timber scattered about and many decaying stumps. Through it ran a small stream, and standing in the stream they saw a large black bear. Not one hundred feet from the *pater familias*, as he seemed to be, could be seen the mother and three cubs. She was busy pulling the bark from the old trees and stumps hunting for grubs upon which her little ones were feeding as the insects were brought to sight. Unprepared for any such sight the gentlemen thought it best to remain motionless, and having no arms it is needless to say they were quite nervous. For over an hour the ursine family kept possession of the lowlands, until a huge stone was rolled down the ridge and a terrific shout was raised, when the bears snorted, drew together, and shuffled off out of sight. At least one dozen full grown animals have been seen in this neighborhood, which has been famous for bears.—HOMO.

A LONG SHOT.—Gold Hill, Nevada.—After a fruitless day's hunt after geese, Friend Bob and myself were tramping toward home tired, hungry and wet, lamenting our bad luck and wishing that small boy who told us where there were "millions on um" was dead, when suddenly three geese were descried feeding about 125 yards beyond a fence just in front of us. Almost wild with excitement we wormed ourselves under the shelter of the fence, loaded up and surveyed the ground. Bob was preparing to shoot when I assured him that the geese were fully 130 yards distant, and that although his gun was a good one, and his shells loaded with 5 drams and BB, he would never be able to reach them. But perceiving that the geese were feeding from us and the chances for a shot decreasing, in spite of my remonstrances, he "let go," and to my surprise one of the big birds toppled over. I ran to it and having carefully examined it, assured Bob by way of explanation of his extraordinary shot, that one pellet had gone directly through the eye. With a fond look at his 10-bore and the most paralyzing cheek he told me that he "always shot at the eye, when shooting at such long range—it makes the business sure, you know."—SANGRADO.

WOODCOCK IN OHIO.—Wooster, Ohio.—*Editor Forest and Stream:* During the month of March I predicted that woodcock shooting this summer would be a failure. I based my predictions on the extreme cold weather we had during that month. The birds arrived very early and began nesting immediately; consequently all eggs were frozen. What did escape to be hatched were driven out by the prolonged drouths, so at this writing there is no shooting. A good shot with a good dog, might make a bag of from six to ten brace a day. Ruffed grouse are plentier than for many years past; quail are doing splendidly, and are quite plenty, the present and past dry weather being very favorable to them. Mr. Harry Miner of New York, and Mr. J. H. Mack of Haverly's enterprises, and myself, spent a few days at Chippawa Lake, woodcock shooting, with only fair success. —JOHN BOLUS.

IOWA CHICKENS.—Latimer, Iowa, July 10.—The open season on chickens now commences Sept. 1 in this State instead of Aug. 15 The weather has been more favorable for them while hatching than for several years past, and the coveys are all full, the most of them having at least a dozen. Saw ten or twelve coveys to-day and all of them could fly nearly as fast as the old bird. Do not think that any of the old ones will have to hatch the second brood this year. I caught three young mallards and put them with my tame ducks.—RAND.

INDIANA.—Evansville, Ind., July 11.—I am happy to say that the game law is being rigidly enforced here. I have three good gun clubs who are aiding me in every way, and we have been a terror to offenders. We have three suits with one party, who thought he could beat us, but we came out beautifully on top. The fish law is a dead letter here, as those most interested seem to take no interest in the matter Prospects for quail are better than for years past.—F. M. GILBERT (Game Warden First District, Indiana).

COLORADO.—Salida.—Have seen a few deer this spring and expect to find plenty in the fall. Of rifles give me a .40-70 and I ask no odds. They kill, are safe and sure. Any American 12-bore, 30-inch shotgun, modified choke, of reputable make, will do good work if you form the acquaintance of your gun.—KOKOMO.

THE MAN TARGET AGAIN.—Salt Lake, June 30.—Frank W. May and Joseph B. Tomlinson, both formerly of this city, went hunting near Belknap, M. T., Wednesday evening. May made a circle in his travel and in the dusk came upon Tomlinson, who mistook him for a deer and shot May dead.—*Sacramento Bee.*

ARRIVAL OF SHORE BIRDS.—Salem, Mass.—Saw four robin snipe (*M. griseus*) July 9, also about two dozen "peeps." Summer yellowlegs are reported, but I have not seen any yet.—X. Y. Z.

WHAT THEY SAY OF "WOODCRAFT."

"WOODCRAFT" is the title of a book that should be in the hands of all who delight in an outing in the woods. It opens with a portrait of the author, that genial old hunter and fisherman, "Nessmuk," who graphically describes in his own easy way what should be taken on a camping-out trip. From years of experience he gives what he has found to be the best method for making camps and camp-fires, fishing with and without flies, the best tackle, etc., and devotes some space to hints about cooking. Canoes, their build and qualifications, occupy a full chapter. The book contains many things that, though probably known before, are often forgotten, and being replete with useful practical information, will undoubtedly supply a long-felt want among pleasure seekers.—*St. John (N. B.) Daily Telegraph.*

Sea and River Fishing.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—X.

THE Assistant Postmaster was eager to try one of those wonderful abortions lately inflicted on the craft in the shape of an automatic, stem-winding, cockless, chokebore, rim-and-center-fire, lightning-geared, wind-'em-in-without-touching-it reel, and accordingly the next morning we took our way in the little weather-boarded boat down to Sturgeon Bay, where we were sure to get as many pickerel as we would care to handle, if nothing else. We took with us five minnow buckets which we intended to fill with good minnows to try on the bass in place of frogs, for pickerel fishing was beginning to be a trifle monotonous, and as I had not yet taken a bass, every joint in my frame was aching to feel the old-fashioned rush of a five-pounder and to experience the sensation of each individual hair straightening out at once when he made his first leap into the air.

Dick and the Scribe were half a mile down the lake ahead of us, apparently in a difficulty with something, and as we neared them we saw that Dick was engaged in a glorious fight with a heavy fish of some kind that was fully trying the stuff his rod was made of, and we lay off fifty or sixty yards outside to watch the issue of the point in dispute.

He was standing up intently watching the line as it cut through the water in a circle around the boat, the Scribe the while sitting placidly at the oars waiting, as he said, "to see Dick's rod break." But Dick's rod did not break, and we watched the progress of a splendid battle, that was hotly contested on both sides, until from sheer exhaustion the fish was compelled to succumb to Dick's better staying qualities, skill and fine tactics.

"Whoa there!" he shouted, as the fish made a powerful rush for the belt of grass. "Look at that, will ye?—must be that old he muskylunge o' Dan's an' yourn by the way he pulls. Come out o' that grass, durn ye, or I'll jerk yer jaw off;" and, as the Scribe swung the boat around, we could almost feel the rod crack in our own hands, so great was the strain on it and so intensely interested were we in the struggle. We could hear the Scribe's quiet suggestion, "Give him a little line Dick, and let him clear that big weed or he'll say good-bye to you," and Dick's vigorous rejoinder, "Who's a ketchin' this fish? back 'er up; swing 'er 'round 'tother way a little—there; now we've got him," and as the rod straightened up a trifle the fish swung out into the lake and headed for our boat. A few strokes sent us out of the way, and Dick again addressed himself to the fish.

"Fool old Richard by sneakin' into the grass, will ye? not much, if this old rod's as good as she used to be. I've been a lookin' fur ye fur twenty-five years, an' now I've got ye we'll have it out right here without any more pollyfoxin'. Sucked in the wrong frog, didn't ye?"

Here he took off his hat and dropped it in the boat, the fish all the time taking the line out from under his thumb with a pull that must have nearly blistered it, but Dick's Scotch was up and he would have paid no more heed to a blistered thumb just then than he would to a mosquito bite. When within twenty yards of our boat the strain was too great for the fish, and he came to the surface with a swirl and started back for the grass again.

"Must be a grass bass," said Dick, as he shortened the line and prepared for another tug to keep the fish out of the weeds. "I'll ye boys, he pulls like a hoss, look at that rod will ye, ain't she a daisy?" and then a few remarks to the fish, "think you'll git over there an' profligate 'round 'mongst them weeds till ye saw the line off an' git away, do ye? I'll jest show ye that it don't lay in yer britches to work that little game on Richard when he's got his sinister eye on ye. Look out there now, you old sardine! or I'll jerk ye whopper-jawed if ye try to git into that grass ag'in."

We laughed "voriferously" at Dick's quaint talk to the fish, but he had his hands too full to pay any attention to us, and the struggle went on. This time when he was pulled away from the bank of weeds the brave, game fish showed sign of having lost heart in the fight and after running most of the line off the reel he was brought back alongside under an easy pull, when the Scribe reached out with the gaff and lifted him into the boat, a dark-backed pickerel a little over three feet in length. He was a fine fish and had made a long and gallant struggle for his life, but Dick's taking ways and the remarks he had made to him at critical points in the battle had discouraged and bewildered him and he had lost his head (literally) and was now ready to take his place in Merrill's bar'l with others of his tribe who had been lured to their downfall by the same hankering after speckled frogs. To say that Dick was inflated with pride over his victory would be drawing it very mild, and as we had enjoyed the sport nearly as much as he had, we gave him a cheer and left him hooking on a fresh frog, with the remark coming over the water to us, "I'll jest angle fur another o' them sardines."

The wind was now rising again, this time blowing straight up the lake, and by the time we passed Pickerel Reef and turned the point toward Black River it was blowing quite fresh and the little boat plunging her bows into the waves with thumps that made the spray fly. Dick and Knots were coming half a mile astern, and it was a plain case that Knots, who was at the oars, had forgotten most of his early aquatic training (if he ever had any), as the boat would first shoot off with a sudden fit of determination toward the sandbank for a hundred yards, then by hard clawing with the starboard oar he would head her around and go lickety-split for the charred landmark on the opposite shore for a while; fierce clawing for five minutes on the larboard oar would then head her down lake for a short distance, and we could see them bobbing up and down like a cork, but evidently making little progress in the right direction. Suddenly, the wind would catch her on the larboard bow and away they would go again for the sandbank. The zigzag of an old-fashioned rail fence wasn't a marker to the erratic course of that "red cruiser of Black Lake," and we were moved to much hilarity at the heroic efforts of old Knots to keep her head to wind, which truly impels me to say was not very brotherly in us, but it must be borne in mind that we were not wooden Indians.

Knots would no doubt gladly have changed places with Dick, but the water was too rough to make the attempt, and with this in mind we let our boat drop back with the wind with the intention of taking them in tow and helping them down into the shelter of Sturgeon Bay, but when we came within hail Knots would not be towed, and when asked "Why all this meandering over the lake?" said, "Oh, I'm just rowing around for exercise, and as this boat is inclined to be a little devious I though best to let her gang her ways;" "An' that 'pears to be mostly sideways," chipped in Dick, who seemed perfectly content to let the Scribe take all the exercise he wanted.

This perversity scattered our good intentions to the winds, but Knots is nothing unless he is perverse, and it has become a settled notion with some of us that should the blessed old bundle of knots and gnarls ever fall into a stream and be drowned, his body would never be found unless near the extreme headwaters, feet up stream, for he never would by any possibility be induced to float with the current.

We left them to pursue their zigzag way and pulled down around the "stem-winder," past the mouth of Little Black and tied our boat to a stake driven into the soft mud in six or eight feet of water, at the edge of the belt of water lilies fringing the point separating the river and Sturgeon Bay, to fill our buckets with minnows; and I will say here, for the benefit of any wandering brother who may go to Black Lake, that around this point and for some distance along the lilies up the little bay is the only locality we found where good minnows could be taken in abundance, and they had to be caught with hook and line, or they might perhaps have been taken with a baited dip net, but this method we did not try, mainly on account of the conspicuous absence of the dip net. Seining for them is out of the question.

If a place is found around this lake, or most of the other lakes we have fished in this northern region where the shores are bare enough of grass, lily pads or rushes to make a draw with a seine practicable, right there you will be sure to find no minnows. We lost no time in getting to work, but a dozen casts around among the open places in the lilies led us to believe we were doomed to another backset, as we got nothing, nor could we see anything that looked like a minnow. A sudden twitch at M.'s line, however, was a symptom, and an instant later a vigorous jerk sent a five-inch shiner sailing over his head, and the hook tearing out, the victim landed "sab" on a broad lily leaf ten yards back of the boat. A suggestion that "leetle more moderation" in the use of the flexors and extensors, as our worthy brother, Dr. Henshall, would likely record it, might produce better results, had the desired effect, and the next one was flipped quietly out and placed in one of the buckets. Soon they came from all directions, out of the grass and lilies, and in ten minutes there must have been a solid half bushel of shiners in sight, all fighting eagerly for our baits the instant they were under water. They were from three to six inches long and we had our pick of sizes to suit the most "facetious" bass, as Dick would have said. Now and then a four or five inch perch would dash in, and with a quick snap seize the tempting scrap of worm and the next moment be dangling and wriggling in the air, wishing, no doubt that he had stood back and strained his jaw laughing at the silly shiners instead of making a fool of himself.

Occasionally a "blue gill" or a "red eye" would suck down worm, hook and an inch of line, and then our little switch rods, cut in the bresh a half mile above, would be called on to show their best qualities and temper in the vehement struggle that would at once ensue. When one of these were returned to the water, they would dart away under the lily pads in open-eyed wonder, thinking, we had a notion, that some new kind of lightning had struck, and they had better hunt other diggings for fear of another stroke.

But the silly shiners had no settled notions on the general effects of this kind of lightning, and just kept on fighting for the seductive worm—and even the bare hook—regardless of the fact that their comrades were being rapidly transferred to our minnow buckets, with crushed hopes and badly yanked jaws.

It was rare sport in a small way, and we enjoyed it vastly more than we would a whole day's bass fishing, at least the bass fishing that I had been having.

Brother Muller avers that he took not less than two dozen of these simple-minded shiners without a sign of bait on his hook, and that he never in his life had as much fun condensed into the same period of time. I think I hear some doubting growler say, "another fish lie nailed," so I will just turn our worthy brother M. over to the tender mercies of the readers of FOREST AND STREAM, to be dealt with by them as gentle as possible, knowing that this was his first day out and not in full practice.

I believe, however, that he did take them with the bare hook, because I was there, but I hardly expect any one else to believe it; however, we have made up our minds that it is "perfectly imperial" to us whether they do or not, as life is too short to waste in trying to prove the truth of all the details of a small fish story. KINGFISHER.

[TO BE CONTINUED.]

WANTON FOOD FISH DESTRUCTION.

THE following correspondence fully explains itself:

F. Endicott, Esq., Staten Island: Dear Sir—I was informed last evening by Mr. Fitzgerald, the proprietor of one of the hotels at the Great Kill (Giffords), that the crews of two sloops engaged in menhaden fishing have been hauling seine along the shores of Prince's Bay for some days past, and have boasted that they took a few days ago at one haul 5,000 weakfish. They have been remonstrated with and requested to desist, but intimate that they will do as they please about it, and are disposed to be quarrelsome. Two or three of the crew of one of the sloops came ashore at Fitzgerald's float yesterday and, after threatening to clean out the place, engaged in a fight in which, I am pleased to say from all that I can learn, they came out second best. I was at the beach last night and endeavored to obtain the names of the vessels then lying at anchor just under Great Kill point. One of Fitzgerald's men, John Crocheron, promised that if they were there this morning to get the names and send them to me. Inasmuch as he failed in doing so I infer that they moved early this morning and have probably gone further down the bay. They are using, so I am informed, a net with two or two and one-half inch mesh. Cannot something be done to stop this lawless proceeding? The resident fishermen of our own county, realizing the justice and medium of the law, have for some years, in response to earnest and persistent effort on the part of the Game and Fish Protective Association of our county, desisted from net fishing during the breeding season. Surely an effort equally as earnest and persistent should be made to prevent the wholesale netting of fish by non-residents on the spawning beds at this season. In haste, yours very respectfully, HENRY T. METCALFE.

Henry T. Metcalfe, Esq.: Dear Sir—On receipt of your letter I forwarded it at once to Mr. Blackford, and herewith append his reply. These people seem to be acting within the pale of the law as regards size of mesh, for by some unaccountable stupidity on the part of former legislators a two-inch mesh is allowed in "the waters over which Richmond

county has civil jurisdiction," one-half inch smaller than in other parts of the State, while in nets used in taking menhaden no restriction whatever is made as to size of mesh. This discrimination was undoubtedly made to protect certain fishing interests in the county, perhaps to save some influential man from the expense of buying a new net. If it has proved to be a two-edged sword and now cuts on our side of the blade, I don't see what we can do but grin and bear it until the next meeting of the Legislature. Still there is a way of getting at them. It unquestionably was not the legislative intent that the fishing for menhaden should be used as a pretext for skinning our waters of the more valuable food fishes, and if sufficient evidence is produced the Association will be glad to test the matter in the courts. Should you be able to give me the names of these ostensible bunkermen but actual destroyers of our food fishes, I think that we may be able to raise the temperature to an unpleasantly high degree for them. I trust that this letter of Commissioner Blackford's will be given a wide publicity through the press of the county, so that all may be on the look-out to detect and punish the offenders. Thanking you for calling my attention to the matter, I am yours truly, FRANCIS ENDICOTT (Clifton, Staten Island, July 10, 1884).

OFFICE OF EUGENE G. BLACKFORD, NEW YORK STATE COMMISSIONER.—*Mr Francis Endicott, President of the Game and Fish Protective Association of Richmond County, N. Y.:* Dear Sir—I am in receipt of a communication which was forwarded to me, making complaints with regard to the menhaden vessels seining weakfish and other food fishes along the shores of Staten Island. If you will at any time send me the names of the vessels, and if possible the names of the owners, who are engaged in this outrage, I will take steps at once which I think will prevent a recurrence. Respectfully yours, E. G. BLACKFORD (Commission of Fisheries, State of New York, July 9, 1884).

HIS FIRST BLACK BASS.

OUR county is dotted with a great many small lakes, there being about sixty-five, averaging in size from the smallest covering three or four acres, to those covering two or three thousand acres. Every summer, since commencing with the proverbial "small boy" up to the present time, we have spent from two to three weeks camping out among these lakes. Of late years, however, having attained the dignity of a family man, we have been obliged to abandon the camp and engage quarters at a farmhouse near some of the lakes, and so enjoy our "outing" with the family.

Fish any? Oh, yes, some. Any one who went to the lakes was expected to fish, as a matter of course, and we think this was the reason that we fished, because it was expected of us, more than from the real love of the sport. But a change came over the spirit of our dreams, and we found that the trouble was not with the fishing, but with the way in which we fished. We are willing to leave it to any fair-minded man if he would consider it sport to sit for half a day in a small boat, in the middle of a lake, under the broiling sun, holding a pole with a line tied to it, and baited with a lowly "wum," waiting for a stray fish to happen around and get caught? We think such "sport" would have discouraged Job himself. But we will tell you how the "change" came o'er us.

At the farmhouse where we were stopping this summer, there were other boarders, and among them a gentleman who was a most persistent angler. He used to invite us to go with him on his fishing trips, but remembering our previous experiences, we did not think the inducement sufficient.

One bright morning, however, we told him we would row him round the lake, but it was done more to "put in the time," than from any anticipation of sport on our part.

He was provided with a fine rod and reel, with the necessary fixtures for bass casting. Rigging up his rod, and baiting the hooks with minnows, he handed it to us, saying, "Now make a cast right over there by that old fence close up to the shore, and you will get a bass." We took the rod, and after making two or three trials, managed to drop the minnows in the neighborhood of the desired spot. Suddenly there was a commotion in the water down by the fence, and sure enough, there was a hungry bass there waiting for his breakfast, and he went for it, too.

"Hold still, hold still," whispered our friend, "don't jerk, wait till he runs with it." Timely advice, indeed, for we were just getting up our muscle, intending to jerk the fish out on the bank across the lake, for it felt and looked like a whale when it captured our minnow. By this time the bass made up it's mind that it had business somewhere else to attend to, and started to do it. Zip! How the line went out and how the reel did hum! It was an experience we never had before. Under the directions of our friend, who was managing the boat, we checked the fish after it had run about thirty yards, and when we brought him up, "he got on his ear" about it, and jumping clear out of the water, shook his head at us, and then started off again as lively as ever.

After making two or three dashes, he was working back near the old fence, where we hooked him, when we felt an extra jerk on the line, then it seemed as though our line was hitched to the bottom of the lake, and the rest of the inhabitants of the waters were trying to take that minnow away from our fish. The water boiled and splashed, and we could swear that that fish had fourteen fins and as many tails, for we saw them. We tried to work him away from the fence, for it was a dangerous place to get tangled up in, but the pull was so heavy we were afraid the rod would snap. Meanwhile the excitement in the boat increased, at least on the part of one of the occupants, and our friend had his hands full trying to keep us from stepping overboard or on him. He said afterward that we danced all around on the gunwale of the boat and kicked him several times in the bargain. We don't believe this story at all, but if he still persists in repeating it, as we hear he is doing, we shall always feel glad that we did kick him. There seemed to be a change of tactics on the part of the fish, and instead of the long, quick runs, there was a heavy, steady pull, with short jumps and dashes first one way and then the other, in fact it looked as though there was a difference of opinion at the other end of the line.

After playing the fish for a short time it gradually weakened and we reeled in our line. When it neared the boat imagine our surprise and delight when we found that we had hooked two fine bass. When we saw two fish we had another attack, but our friend reminded us that they was not ours yet, or we would probably have lost them after all. We soon had them safely in the landing net and then in the bottom of the boat. Weren't they fine? There was never such fish as those caught before, and they were ours! We caught them. Just think of it, two at once. They were both large-mouth black bass; one weighed three pounds two ounces and the other two and three-quarter pounds.

We never knew before why anybody ever told "fish stories" but found out then. We wanted to tell everybody within four miles all about those two fish and how they were caught, and all the other particulars. All our friends in this locality have heard about it so often that they will not listen any more, and we suppose this is the reason we send it to you. We have been converted and have joined the noble army of anglers. You will find us there any time.

Before closing we want to give in our testimony in regard to our grand paper. We are glad that there is one paper devoted to sportsmanship that can honestly be called a clean paper, and by your success you show that there are gentlemen sportsmen indorsing you. We have never seen the necessity of a pocket-pistol attachment to the rod and gun and we admire your nerve in attacking it. CUB.

CHICAGO, Ill.

CHARMS OF SALT-WATER FISHING.

Editor Forest and Stream:

Your issue of July 10 contains an editorial to which I take exceptions. I am well aware that an editor, like a clergyman, always has the floor, and that any reader who makes an issue with an editor in his own paper is quite likely to get the worst of it in the argument. However, when I see what I think to be injustice, it is my disposition to make my protest, let the consequences fall where they may. The article I refer to is yours on "Salt water Fishing." You say:

"There is a wide difference between the salt-water and the fresh-water angler. The former is content to enjoy himself in his own way and say no more about it. The trout and black bass angler, on the contrary, considers the fishing as merely part of his pleasure; the trip, the scenery, the grand old woods, all inspire him to fight his battles o'er again. There is nothing of this in the salt-water angler, be he a member of a swell bass club or an humble brother of the hand-line committee who takes the Staten Island ferryboat in the morning and, with the patience of Job, goes to the rocks and oyster beds for weakfish and with crab bait awaits a "tide-runner," as the big weakfish are called in his vocabulary. This sitting on a hard seat all alone waiting for something develops a reticence that the fresh-water angler seldom acquires. There is no doubt that the surroundings influence the angler to a greater degree than has been suspected, and the depressing effect of the ocean is noticeable on those who angle in it. * * We have yet to see the salt-water angler who possessed the fire and enthusiasm of fresh-water fishers. It is possible that there may be men who love salt water as the trout angler loves mountain streams. If so we do not know them. * * * The salt-water angler is seldom inspired by the beauties of nature because there are no such beauties in the surroundings to be inspired by," etc.

Now, my dear sir, I must assert that you are not fully conversant with that of which you write. In the first place, you forget that such anglers as Genio C. Scott and Robert B. Roosevelt, both notably salt-water anglers, have been anything but "silent men," have never been lacking in inspiration or poetry of expression, and have been what seems to me very happy in their descriptions of the beauties and pleasures of salt-water fishing; and a score more I could name of our devotees to salt-water angling, whose souls are full of inspiration and sentiment derived from their association with the shores, rocks and waves of the ocean, while enticing its finny inhabitants with rod and reel, and even with the despised hand-line, at which let no one cast a sneer. Come with me, my dear sir, and stand on the ledges, near which may be taken that royal fish, the striped bass, the bluefish, or the gamy and obstinate tautog, and let the bracing breezes of old ocean fan your cheeks and fill your lungs with the stimulus of pure ozone, while the breakers dash over the rocks, fling their spray in your face and eddy and boil around your feet, and as some noble fish dashes away with your bait and tries your skill and tackle, and you wonder whether the quarry is yours or whether fish and elements combined are not more than a match for your prowess, and with the voice of the booming waters in your ears, your every faculty awakened and aroused by the grandeur and beauty of your surroundings, come and you shall no longer say there is no inspiration in salt-water angling, but you shall feel the power of nature in your soul, and you shall say that angling has resources far greater, grander and more exciting than you ever dreamed of in your philosophy, and you shall envy the salt-water angler in that he has been all the while the possessor of joys such as had never before come to your knowledge. You will no longer call the sea "monotonous;" you will see that it is ever varying, ever changing and ever and always a source of new beauties and surprises and delights, and at the same time you will feel the resistless power which dwells there and compels your acknowledgment. I have stood on the brink of Niagara and felt silenced by its awful presence. Similar sensations come over one when he communes with nature in any of its grander developments, and the ocean has, perhaps from its very grandeur and force, tied the tongues and pens of many of Walton's disciples; but there have been, and are, many who have described its delights and resources with a fullness and eloquence that need not blush beside the choicest efforts of those who only sing the praises of the mountain stream or woodland lake. The ink has long ceased to flow from the pen of the gentle "Genio," but we have still a Roosevelt and a Ward, and many there be like them, and to these I say, rise up my brethren and assist me in the defense of one of our grandest and most favored sports—salt-water angling.

C. T. DUNCKLEE.

BOSTON, Mass.

Editor Forest and Stream:

Having been a reader and contributor of the FOREST AND STREAM for a number of years, and seeing an editorial in your last issue on salt-water fishing, I write you concerning that sport. I am one of those who indulge in that kind of fishing, and would like to give some of my experience, or rather inform those who love salt-water fishing how I have succeeded for the last three weeks. We all know that everybody is not placed in a position to go fishing for three or four weeks "at a lick," nor write long articles about it, and some people don't believe in fish stories sent on by parties hundreds of miles away, unless they put a little more salt in them.

I will give you an account of my sport and luck combined that I have had lately, hoping others will do the same. Friday evening, June 20, a party consisting of myself and two friends took the last train on the New York, Woodhaven and Rockaway Railroad to Broad Channel, Jamaica Bay (you can start from Hunter's Point, Bushwick, or Flatbush avenue as well). We stopped over night; room and bed for $2.50. Got up at 3 A. M., took a boat and paid fifty cents for use of same. Pint of shrimp cost forty cents. Started at 3:30 A. M., tide running in, and went east to the club house, or a little above it, between the club house and a place they call the "Pot," known to most of our baymen, and dropped anchor, rigged our rods and commenced to fish about 4:30 A. M. I was the first to get the line over, and soon hooked a two-pound weakfish, and a hungry fellow he was, for he had my bottom hook away down in his belly. We fished until 6:30 A. M. The tide changing, fish stopped biting, and to be sure we stopped fishing, put up our tackle, and took a bite ourselves, which we had fairly earned after one hour and three-quarters of exciting sport, for fish at that time in the morning bite fearful and almost take the rod and reel out of your hands. We counted our fish, in sizes running from one and a quarter to three and a quarter pounds, and 129 was the number, all weakfish. Now if this don't come up to your fresh-water fishing, I mean when you fish for about five or six hours and catch thirty or forty fine trout from five to six inches in length, or about six to the pound, and instead of sailing to your hotel in a boat you must walk from three to five miles and carry a heavy load of trout, then I am greatly mistaken. We congratulated each other, divided our fish, and by 8 o'clock we fastened our boat to the float and took the first train for home.

The following Monday, June 23, the same party with an addition of two boys, one nine and the other fourteen years of age, took the train for the same place, started out at 3 o'clock on Tuesday morning, my two friends in one boat and the two boys in the boat with me. We took it very easy, for the largest boy pulled my boat up to the fishing grounds, the tide running in of course, and the two boats anchored close together. My friends began to catch fish while I rigged the boys with drop lines. The small boy on the start lost two fish, but the third one he pulled in with such a force, slapping the fish on the side of my head that my hat went overboard. He continued pulling in fish and caught nineteen before he was tired out. Good for a boy of his age. Fishing up to 8:30 A. M. we put away our tackle, counted our fish, and had 86 and my friends 59, making a nice little pile, 145 in all. We got back to the dock and took the 10:47 train for Bedford Station, got home, and surprised our friends with a grand mess of fine fish.

July 7 the same party, the two boys included, started from the float at Broad Channel for the fishing grounds at 3:30 A. M., the tide running in, water smooth as glass, and full moon. It would cure a sick person to be out on the salt water on such a lovely morning. You could hear the meadow hens cackle for miles around you, now and then you would hear "quack, quack" from large birds called by that name, and bluefish, or snappers, as they call them, could be seen breaking all around. We got on the grounds about sunrise, and such a beautiful sight! The boys felt delighted. We fished up to 7 o'clock. The two boys and myself caught seventy-six and my two friends twenty-four, all weakfish except one bluefish and one blackfish. We started back for the dock, took the 8:47 train for home with as nice a lot of fresh fish as you want to look upon. Now, Mr. Editor, if anybody doubts my word, I live at 715 Myrtle avenue, and can prove this to be a fact.

If some of the salt-water fishermen will follow and give a true account of their luck or sport, you or your fresh-water anglers will begin to think that there is a good deal of sport and pleasure in salt-water fishing. Now where can you find more exciting sport than there is in trolling for bluefish with a seven or nine pound monster hooked on each of the four or five lines out? It takes men with good nerve to stand the excitement or they may get seasick or be pulled overboard by a fish. If anybody would like to catch sheepshead, let him go to Holland's Station, Rockaway Beach. Lewis Walton will furnish you with a boat, or tell you where to go or take you out himself. They catch them under the hotel dock or at the Neptune House wreck, and one or two places under the trestle works. Besides there are plenty of small fish in the bay and good sport for children. A friend of mine caught a four and a half pound sheepshead near the club house while fishing for weakfish, using shrimp for bait. There is good weakfishing on the Rockaway side up the bay on the oyster beds or "Silver hole," only bear in mind that fish will bite only at certain states of the tide, and that is the time you want to be on hand. This week I will try them below the trestle works in the channel or at the "Runt," where they often catch very large weakfish. KNEBEL.

BROOKLYN.

"NESSMUK'S" BREAD RECIPE.

Editor Forest and Stream:

I received my copy of "Woodcraft," and find it extremely good reading. I should know something of its subject, but the extent of the information acquired by one who has really made a study of the matter for a half century, is something wonderful even to one who has often faced nature in her wildest moods. I observe that "H. P. U." is disposed to criticise a portion of the outfit recommended. I can stand "Nessmuk's" boots and cutlery well enough, but I am led to ask further light upon his method of making bread. Upon this subject I am not an authority. It would perhaps be hard to find a man who has camped as much as I, and made less bread. I found on page 93 of "Woodcraft," instructions for the use of three (3) tablespoonfuls of baking powder to a quart of flour. I thought it a big dose, and asked a member of my family, who said she thought the bread would not be good. As I have been led to believe that she knows the most of what is commonly thought worth knowing on this subject, I was naturally confirmed in my opinion, especially as the quantity named far exceeds that given in any published recipe which I have seen. May it not be a printer's error? [No.—ED.] Inquiringly, KELPIE.

CENTRAL LAKE, Mich., July 9, 1884.

THE TALE OF A FISH.

Youth and maiden
In a lakelet
Flirt and float,
Maiden thinks the
Water cool,
Puts hand in it—
Little fool,
From her finger—
Heedless thing—
Loses pretty
Diamond ring.

Maiden frantic
Tears her hair;
Youth disgusted
Has his swear.
Youth next morning
Fishing goes,
Rod, line, bottle,
Rubber clothes.
Yanks a fish from
Out the tide,
Feels big lump
Upon its side,

Wonders if the
Scaly thing
Could have dined on
Darling's ring?
So with great ex-
Citement rife,
Cuts fish open,
Big jack-knife,
Mystery
To unravel,
Finds? Well, no—
Bit of gravel.

—*F. H. C., in Berkshire Courier.*

FISHING IN COLORADO.

THE fishing season has at last opened. Think of what privation we readers of FOREST AND STREAM have been subjected to. Ever since the first of May we have been regaled with the stories of more fortunate wielders of the rod in the East, but our turn is coming. Like dutiful followers of the immortal Izaak, we brought forth the long neglected rod, and the tackle being overhauled we sailed forth to do or be done.

We found the streams much swollen by the recent rains and there being considerable snow on the mountains, may expect them to remain so another month. Nothing daunted, however, we sailed in (this did not happen until we had been fishing for some time, however), and were soon midst the excitement of failing to strike our intended victim on his first rise and full of expectation. A flash and the usual accompaniment on our part, and we have him hooked. A few wild rushes up and down and one misguided one toward shore, in which we assisted, and he lies gasping on the ground, a fine red and black speckled fellow of about a pound weight. And so it goes on until seventeen are reposing in our creel. Pretty good for the first day of the season.

Most of our fishing is done in the South Arkansas River with its branches—Silver and Poncha creeks. In the fall there is fine fishing in the main river (the Arkansas), while across the range, Tomichi Creek affords the best of good fishing. On this latter, about the best ground is in either direction from Sargent. Above us on the main river there are, within an hour's ride on the train, two good streams—Chalk and Cotonwood creeks.

We catch trout altogether, those in the small streams being the regular mountain trout, while in the main river salmon trout hold forth. KOKOMO.

SALIDA, Colorada.

FLY-FISHING FOR BLACK BASS.

Editor Forest and Stream:

I see numerous accounts in your valuable paper of good catches of black bass in various parts of the country with bait, minnow and trolling spoon, but not many reports of good success in fly fishing for this royal fish. I do not know whether it is because bass do not rise to the fly in the places reported, or because the anglers have not yet learned the fact that the fly-rod and artificial fly is the most successful means of capturing the bass, to say nothing of the great superiority of fly-fishing over every other method, in the pleasures to be derived.

During the past two weeks, the fly-fishermen of Syracuse have had excellent success upon Onondaga Lake. Strings of from ten to twenty bass, ranging from one to three pounds in weight, have been brought in almost every day. These bass are all small-mouth, very plump and firm. Every one who has caught them, speaks of the extraordinary power and vigor with which they fight, making many leaps high in the air, frequently breaking loose, or tearing the hook from the mouth.

No such fishing has been had on our little lake for years. Men who never cast a fly are now eagerly learning the art. When one has once felt the thrill of a three-pounder on a seven-ounce rod he discards bait-fishing forever.

With rod, landing net and book of flies and leaders, the kit is complete. No trouble with bait, no searching after minnows to annoy and vex the angler. Here the best fishing is from three o'clock to eight o'clock P. M. or so long as the flies can be seen to drop. The later the hour the darker the fly to be used. WAVERLY.

SYRACUSE, N. Y., July 11.

[Reports from Greenwood Lake, and other waters near New York, say that the bass do not take the fly well this season. Many fly-fishers have been disappointed at this, especially as the bait-fishers have been doing well.]

SAWDUST AND MALARIA.

POTSDAM, St. Lawrence County, N. Y., July 10, 1884.

Editor Forest and Stream:

In the second paragraph of the article on "A Use for Sawdust," printed on first page of FOREST AND STREAM of the 3d inst., is a statement so utterly baseless that it must not go unchallenged. After charging the destruction of the fish in the streams which flow from the Adirondack forest to the presence of sawdust in the water—which is not reasonable, as fish, except trout, are more abundant below the sawmills on the Raquette River than above them—the article continues: "Sawdust kills human beings. Waters polluted by it spread malaria. This is notably the case with the Raquette River, whose whole lower course is cursed with chills and fever; and Potsdam, where one of the State Normal schools is located, has become a very undesirable place of residence from this cause." It is this defamation of character which is odious, the more hateful because the statement is absolutely untrue. Plain language on this writer's part must be excused, because during his residence in Potsdam of sixty years he never heard that a case of chills and fever had originated here. Parties have at long intervals brought the disease here from the West; but in our "sawdust"-laden atmosphere have been rapidly healed. Dr. J. Reynolds, our oldest physician and one of the most respected members of the medical profession in St. Lawrence county, authorizes the statement that in nearly thirty years' continuous practice in Potsdam, and up and down the valley of the Raquette River, he has never known or heard of a case of chills and fever having originated here.

To those who have read the article in FOREST AND STREAM, which has been under consideration, it has seemed very unjust, and that if Potsdam had been a pest hole, and that the State Normal School was planted at a point especially exposed to contagion, the public would not have been more severely cautioned against both. Whereas the truth is that no town in the State has been, or is, more exempt from disease of any and all kinds.

May we fairly expect that FOREST AND STREAM will be willing to repair the wrong which it committed? And to that end will it publish this communication, and thus remove as far as possible the stigma cast upon the town and the school? A CITIZEN.

[The evil effects of sawdust on fish are so well known by those who have given the subject any investigation that it is not worth our while to argue the point. We alluded to the malaria in the Raquette valley as something well known. It is. We are surprised that "A Citizen" should regard the allusion as "odious." The writer of the editorial article in question had, within his own experience, decidedly unpleasant evidences of what he was talking about when he wrote of the malarious character of the district in question; and his own experience was confirmed by this part of a letter, received last April (1884), from a clergyman, who lives not a thousand miles from Potsdam: "Yes, Potsdam has increased greatly in its reputation for malaria, and the entire Raquette valley is a malarial fever producing region. The flow and power of the stream is far short of what they were years ago, while malaria years ago was unheard of. The Grasse valley has not suffered so much, and malaria in this valley is not common. These are the joint conclusions of Dr. —— and myself. If I may venture a prediction I will say that the Normal School catalogue at Potsdam ten years from now will show at least 50 per cent. less attendance from out of town; and while I have not made a comparative examination, yet I think that the attendance upon that school from out of town is much less to-day than five years ago The fault is not with the administration nor with the school, but lies in the deservedly unpopular odium that rests upon the town in proportion to the increase of malaria reported. There is not in St. Lawrence county to-day a village that better merits growth by its enterprise and push than Potsdam, and yet there is not one that is so 'quiet.' The town is in 'stays,' and all as I believe on account of its malaria, that 'will out' in spite of the general disposition of its inhabitants to ignore its presence." Whether the sawdust is to blame for all the malaria or not is a question that will admit of argument. Perhaps the sawdust is only partly to blame; and the damming and back-watering on the Raquette also have their effect. Nothing was further from our intention than to injure the citizens of Potsdam. We thought we were doing a public good by pointing out how they and the dwellers in other malaria-plagued districts might benefit themselves by removing the refuse sawdust pest, and so taking away one source of disease.]

A FISHERMAN'S BAD LUCK.—A gentleman named Emory, residing in Baltimore, Md., but at present stopping in West Chester, Pa., met with quite a thrilling adventure a short time ago while fishing along the Brandywine. He had been visiting the farm of Mr. Charles Roberts, an extensive breeder of Friesian cattle, and while there, expressed a desire to try his luck at fishing. He was supplied with rod and tackle, and as the stream was close by, it was not long before he was deftly casting the fly. After fishing a short time, he was approached by two men who engaged him in conversation. Learning that he was by profession an engraver, and that he made the engraving of fancy stock a specialty, one of the strangers wanted him to go with them, and look at some they would show him. Without the least suspicion that anything was wrong he accepted the invitation. They had not proceeded far when one of them pulled a pistol from his pocket, and pointing it at Mr. E., demanded his money. He remonstrated, and was knocked senseless. When consciousness returned, he found himself at Mr. Roberts's barn, tied hand and foot, and minus a gold watch and over one hundred dollars in money. The case was reported to the authorities, but up to the present time no clue has been obtained to the perpetrators of this outrage.—OCCASIONAL.

PHILADELPHIA NOTES.—Our rivers are commencing to clear up, and should we have no severe rains, in a few days the water will be in a good condition for bass fishing. The Perkiomen Creek will soon have a new railroad—the Schuylkill Valley—running on the borders of the entire stream. This will make it of easy access. Now it is reached by the Reading Railroad, which lands one on the shore of the Schuylkill opposite the point where the Perkiomen flows into the river. This makes it rather difficult to reach without a rowboat, which is not at all times easily procured. Parties who have lately returned from Betterton say the perch are not frequenting those grounds as yet this season. Such as have been taken are small.—HOMO.

DENVER, Col., July 1.—No fishing here yet; too much snow now and snow water.—M. W. R.

Fishculture.

COMPARATIVE EXCELLENCE OF FOOD FISHES.

[A paper read before the American Fishcultural Association.]

BY DR. JAMES A. HENSHALL.

IN this paper I design considering the relative merits of certain fishes as food, solely as to their comparative excellence of flavor, and not, in any sense, as to their nutritive qualities, as commercial fishes, or as food for the masses. The inherent or innate excellence of flavor is alone considered; that is, the fish is supposed to be simply boiled, fried, broiled or baked, without the addition of extraneous substances, as sauces, condiments, etc., except the indispensable salt and perhaps a little black pepper. Moreover, I speak in the light of the ample personal experience of having eaten of all the fishes mentioned, from Montauk Point to Key West, and from Lake Superior to the Gulf of Mexico, and, with the sole exception of the salmon, of having eaten of them all perfectly fresh, or literally out of the water into the kettle, broiler or frying pan, which is the only true test of the peculiar flavor of each fish. Of course one is necessarily guided in such a matter by his own individual tastes and idiosyncracies, and due allowance must be made for this "personal equation," though I believe that most persons will agree with the conclusions drawn. But there is no accounting for gastronomic tastes, likes and dislikes, which proverbially disagree, as evidenced by the old saying, "What is one man's meat is another man's poison," or to express it more appropriately, in this connection, and to perpetrate an old Anglo-Gallic-ichthyc pun: What is one man's *poisson* is another's poison. For the sake of convenience I will separate the different fishes into several groups: (1) fresh water, (2) anadramous, (3) estuary, and (4) marine. The various fishes in the several groups are arranged in their sequence according to their degree of merit.

FRESH-WATER FISHES.

The whitefish (*Coregonus clupeiformis*) is far ahead of all other fresh-water fishes in its exquisite delicacy and richness of flavor. Its flesh is pure white, firm, flaky and free from small bones; and while a "fat" fish, does not cloy the palate like the salmon, mackerel, and other "oily" fishes. But to realize the delicious savor and flavor of the whitefish, it is imperative that it be in its best condition, and that it be cooked as soon as possible after being taken from the water; for when in poor condition, or long out of the water, it loses entirely its characteristic excellence. The whitefish is essentially a broiler, being excessively fat in the fall before spawning, when it is in its best condition. Those of Lake Superior and the Straits of Mackinac are preferable to those of other waters of the United States. I have eaten broiled whitefish at the Old Mission House, at Mackinac, for twenty-one meals a week, and like Oliver Twist, asked for more. It resembles, more than any other fish, the pompano in flavor, and in my opinion is second only to that peerless fish in its excellence for the table.

The brook trout (*Salvelinus fontinalis*), when freshly caught, I consider, among the fresh-water fishes, next to the whitefish for the table; but as obtained at the restaurants, I prefer the black bass or pike-perch. When served up in camp beside a trout stream (the small ones fried, the large ones boiled), the flesh is pinkish, very firm, and of a delicate, delicious flavor, though rather too dry to suit some palates. It is a fish that will not bear transportation, however carefully packed, without losing its savor; and this is likewise true of all delicately-flavored fishes. Moreover, it will absorb and retain the "twang," and smack of the packing material or the container.

The Black Bass (*Micropterus*).—Next to the freshly-caught and cooked brook trout, I rank the black bass of either species. Its flesh is pure white, firm, flaky, free from small bones and of a rich sapid flavor when in proper condition. Just after the spawning period the flesh has a musky taste and odor, which is disagreeable to some persons. The character of the water has much to do with the excellence of the black bass for the table, and as it inhabits so many waters of different conditions of purity and temperature there are as many opinions of its gustatory qualities. The small-mouthed bass is generally the best flavored, as it usually exists in the purest waters; but where both species co-exist in the same water there is no apparent difference in taste or flavor. I have eaten small-mouthed bass of some waters which were inferior to large-mouthed bass of others. Contrary to a popular impression, I will state that the finest-flavored black bass I ever ate, and even superior to any brook trout I ever tasted, were large-mouthed bass of certain streams in Florida, notably the upper waters of St. Lucie River, on the east coast, and the Weekawachee River, on the west coast. These are remarkably clear and pure waters. Black bass should be fried or boiled, according to size.

The pike-perch (*Stizostedium vitreum*) is a staple fish during the early spring throughout the West, being shipped from the great lakes. It bears transportation well, the flesh being hard, white, flaky and of good flavor; consequently, it is much esteemed during the Lenten season. It is a very desirable fish for lakes and rivers which have a good depth of water, being very hardy and prolific, and one of the best percoid fishes. The smaller ones should be fried, those of six pounds and over should be boiled.

The mascalonge (*Esox nobilior*) may be classed as a good dinner fish in the fall and winter, when it is in its best condition; it has, however, been much overrated. It has yellowish or pinkish flesh, according to season, which is of good quality and fair flavor, with fewer small bones than any of the pike family. It is never a "fat" fish, and should either be boiled or cut in vertical slices and fried.

The Mackinaw trout (*Salvelinus namaycush*) varies greatly according to size, season and locality, as to its edible qualities. In the Great Lakes, where it is taken with the whitefish, it is lightly esteemed in comparison. In other waters, as in the lakes of the Eastern States, it is more highly prized. The flesh is yellowish white to red in different waters, and may be classed as rather good and well-flavored when in its best condition. In good condition it is a very fat or oily fish, and should be boiled or cut into vertical steaks and broiled.

Catfish (*Siluridæ*). The various species of catfish and bullheads are good, bad, and indifferent, as articles of food. Some of them are really excellent when properly cooked, and would prove an agreeable surprise to most persons who are prejudiced against them. The forked-tailed cat of the lakes and the Mississippi (*A. nigricans*), and the channel cat (*I punctatus*), when of suitable size, and when parboiled and baked brown, are not to be despised by an epicure, the flesh being rich and savory, though not very firm.

There are a number of fresh-water "pan fish," fair in quality, which I consider best in the order named; as white bass (*R. chrysops*), croppies (*Pomoxys*), rock bass (*A. rupestris*), the sunfish (*Lepomis*), yellow perch (*P. americana*), etc. Last and least in point of merit among fresh-water fishes (and which are just better than "no fish") are the pike, pickerel, buffalo, suckers, etc.

ANADROMOUS FISHES.

The salmon (*Salmo salar*) stands at the head of this group when "fresh run" from the sea. Its excellence is so well known that it needs no further notice here, more than to observe that after spawning no fish is more sorry or ill-flavored. The comparative excellence or worthlessness of anadromous fishes, before and after the breeding season, is more strikingly exhibited in the salmon than in any other of the group.

The shad (*Clupea sapidissima*). Of the anadromous fishes, none is so well known or so much appreciated as the shad, whose rich, delicate and luscious flavor is pronounced by many to be superior to that of any other fish. Suffice it to say that he who has never partaken of that Lenten luxury, "planked shad," has an epicurean revelation in store that will surprise and delight him. The shad should never be served in any other way than planked or broiled. It well merits its name, *sapidissima*, and one can tolerate its numerous bones in consideration of its fine flavor.

ESTUARY FISHES.

This group comprises so many species, and of so wide a range, and some vary so much in edible qualities in different waters, that it is difficult to institute a just comparison.

The pompano (*Trachynotus carolinus*). Although a fish of southern waters, the excellence of the pompano for the table places it at the head, not only of the estuary fishes, but of all known members of the finny tribe. It is incomparable with any other. While in the restaurants of New Orleans and Mobile it is the fish beyond compare, it is worth a trip to Southern Florida to realize the delectable, luscious savor of a freshly caught and broiled pompano. The salmon, whitefish and shad alike pale before its superexcellence. A broiled pompano's head is a *bonne-bouche* to eat and dream of for a life-time. See Rome and die, eat pompano and live! The pompano has a creamy white flesh, of a gelatinous richness, without the oily taste of most broiling fishes. It must not be confounded with the dark-meated fish called pompano on the Carolina coast, which is a crevalle (*Caranx*). The bones of the pompano are few and soft, and one can eat them "bones and all."

The striped bass (*Roccus saxatilis*) enjoys a deserved reputation as a table fish. Its firm, white and delicious flesh is so well known that it needs no further comment. The memory of its savory flavor and odor, broiled at camp fires on the Chesapeake, steals over me as I write, with a conscious yearning for the flesh-pots of Egypt.

The sheepshead (*Diplodus probatocephalus*), while excellent in Northern waters, is only tolerable in those of the extreme South. North of Cape Hatteras it is justly considered a great delicacy, broiled or baked; while in Florida it is not above mediocrity, having a piquant, pungent flavor that is decidedly unpleasant.

The bluefish (*Pomatomus saltatrix*) is another fish that varies in its eatable qualities in different waters, and which, perhaps, depends on the nature of its food. North of Cape Hatteras it is well-flavored, of good quality and much esteemed, though inclined to be too oily; while in Florida waters it is excellent, far exceeding in richness and flavor those of the North. Its flesh is firm and white, and it should always be broiled or planked.

The whiting (*Menticirrus nebulosus*) is a small, but good fish, one of the best for chowders. It has a fine, white, flaky flesh of rich flavor, and is much esteemed as a breakfast fish, broiled or fried.

The weakfish (*Cynoscion regale*) is worthless, unless absolutely fresh, when it is peculiarly sweet and gelatinous, fried or boiled. The Southern species, the salt-water trout (*C. maculatum*), is equally as good a fish for the table.

The red snapper (*Lutjanus blackfordii*) has become a popular hotel and restaurant fish throughout the South and West, where it is shipped from the Gulf of Mexico. It is also extensively shipped to Havana. Being of large size it is a good dinner fish, its flesh being rather coarse, but very white, firm, flaky, juicy, and of good flavor. It should be either boiled or baked.

The tautog (*Hiatula onitis*) has fine white flesh, and broiled or fried is quite toothsome, with a rich lobster flavor. It does not lose its good qualities when out of water, so soon as most fishes.

The redfish (*Sciæna ocellata*) is essentially a Southern fish, though during the summer it ranges as far North as Cape Cod, when it is in its best condition. It grows to a large size, with firm white flesh, of no decided flavor. It is a tolerable dinner fish, and should always be boiled. It is also a fair chowder fish.

Crevallé (*Caranx*). There are several species of crevallé, the *C. hippos* being the most common in Southern waters. They are dark-meated fishes, firm and flaky, with a sharp, strong flavor, (similar to the bonito), which is relished by some but disliked by others. It is an oily fish and should always be broiled. It is easily cured by smoking, when it forms an appetizing dish, far better than when fresh, and superior, I think, to smoked halibut. There are quite a number of good estuary "pan-fish," among the best being the Lafayette (*L. xanthurus*) and white perch (*R. americanus*).

MARINE FISHES.

The Spanish mackerel (*Scomberomorus maculatus*) stands at the head and front of the pelagic or marine fishes. It is second as a table luxury only to the pompano and whitefish. It is a creamy, white-meated fish of great delicacy and richness of flavor when broiled. By many it is thought to be the best fish that swims.

The common mackerel (*S. scombrus*), when fresh and fat, as in the early fall, is one of the best fishes for broiling. As a breakfast fish it is greatly and justly prized, and is too well known to need further notice here.

The codfish (*Gadus callarias*). I mention the codfish out of respect and sympathy for my fellow man, and not for any love that I bear for it myself. It is, perhaps only necessary to say that at the last annual meeting of your Association, your worthy recording secretary* declared that he preferred a fresh codfish to the brook trout or black bass.

*Being a prominent member of the Ichthyophagous Club, any statement of his regarding the flavor of fishes should be received with due caution, inasmuch as by virtue of the onerous duties of his office—"head taster"—his sense of taste has presumably become perverted or impaired.

FISH AND FISHING AT POINT BARROW, ARCTIC ALASKA.

[A paper read before the American Fishcultural Association.]

BY JOHN MURDOCH.

I HAVE been spending the last two years among the Esquimaux of Northwestern Alaska, and it has occurred to me that a short account of the fishes that they use for food, and the methods they employ in capturing them, might be of interest to the Fishcultural Association.

Point Barrow, as you probably all know, is the northwestern extremity of the continent of North America, the place where the coast line, after running nearly northeast from Behring's Strait, turns and runs in a direction a little south of east toward the Mackenzie River and the northwest passage. The point itself is a long, narrow sandspit, continuing the northeast direction of the coast line for some five miles, and then bending to the east-southeast, running on for some three miles more, thus inclosing a sheet of water known as Elson Bay. Just at the elbow of the point is a little knoll of land somewhat higher than the rest, and this is occupied by an Esquimaux village. There is another village about eleven miles down the coast to the southwest. The inhabitants of these two villages together number about three hundred men, women and children. Fish forms an important article of their diet, which consists, I may say, entirely of animal substances, and occasionally becomes their chief dependence. East of Point Barrow, and the nearest about fifty miles off, are three large rivers running into the Arctic Ocean, and to these the Esquimaux resort for the purpose of catching the whitefish and burbot with which they abound.

Early in October, as soon as the rivers are well frozen and enough snow has fallen to make sliding practicable, a number of families start out from both villages, with all their hunting and fishing gear, and proceed to these rivers, where they camp in tents, or build snow huts when they can find snow enough, and remain till the daylight gets too short for hunting, which is about the middle of November. Those of the men who are well supplied with ammunition devote themselves to hunting reindeer, while the others and the women attend to the fishing. The whitefish are caught in gill nets made of reindeer sinew, which are set through holes in the ice and allowed to remain, being visited from time to time and the fish removed.

Three species of whitefish are caught; a small species belonging to the same group as the lake herrings, which has been described by Dr. Bean with the name of *Coregonus laurettæ*, the large *Coregonus kennicotti*, found also in the Yukon, and another large species, also found in the Yukon, which Dr. Bean considers to be undescribed, and which he proposes to call *Coregonus nelsoni*. The burbot, or *titta'lă*, as the Esquimaux call it, is the ordinary species *Lota maculosa* common to all our Northern waters, and is caught with hook and line, though one will occasionally try to swallow a small whitefish which is entangled in the gill net and become "meshed" himself in the attempt.

They use a large bone squid, about four or five inches long, having either a barbless hook of iron or copper, of their own manufacture, or a good-sized cod hook, bought from some whaleship. The bait is a large piece of whitefish, with the skin and scales left on, which is carefully wrapped and sewed round the squid, much in the same way as fishermen on our own coast make an eelskin drail for bluefish. With this they fish through a hole in the ice and take a good many fish. They consume a good many fish, of course, on the spot, but the rest are carefully stowed away in a little house built of slabs of ice, and at that season of the year immediately frozen solid. When they are ready to leave camp, they break up this mass of frozen fish into lumps of a size convenient to load on their dog sleds and bring them back to the village in this condition.

The season of no sun and short daylight is passed at the village. This lasts till about the end of January, and then many families again resort to the rivers, and stay, living in snow huts always at this season of the year, till the first or middle of April. Fish do not appear to be quite so plenty at this season as in the autumn, but they still catch a good many. In the meantime, those who have remained at home have not been without a supply of fish food. There is a small species of codfish, the Polar cod (*Boreogadus saida*), which appears along the coast in large schools about the end of January, or when the sun again begins to rise. We were unable to find out whether the fish really leaves the coast to return in January, but at all events the Esquimaux do not fish for them until then, and say there are none to be found. They would be likely to fish for them were any to be caught, because just at this season of the year they are very apt to be pinched for food, as no deer are to be had, and if the ice happens to be unfavorable seals are very scarce.

Wherever there is a level field of this season's ice inclosed by lines of hummocks, the fish are sure to be plenty. Such a field as this, about half a mile long, practically afforded a living to most of the people in the village during the season of 1883, because that year the ice was very unfavorable for sealing, and food was pretty scarce in the village.

The fishing is carried on mostly by the women and children, though one or two old men generally go out, and one or two of the younger men, when they cannot go sealing and food is wanted at the house, will join the fishing party. Each fisherman is provided with a long-handled icepick, which he frequently leaves sticking in the snow near the fishing ground, a long line made of strips of whalebone, reeled lengthwise on a slender wooden shuttle about eighteen inches long and provided with a copper sinker and two pear-shaped "jigs" of walrus ivory armed with four barbless hooks of copper, and a scoop or dipper made of reindeer antler, with a wooden handle about two feet long. Hardly an Esquimau, and especially no Esquimau boy, stirs out of the house in winter without one of these scoops in his hand. To every party of two or three there will also be a good-sized bag of sealskin, generally made of a piece of an old kayak cover, for bringing home the fish. Arriving at the fishing grounds, each proceeds to pick a hole through the ice, which is about four feet thick, clearing out the chips with the scoop. The "jigs" are then let down through the hole and enough line unreeled to keep them just clear of the bottom where the fish are playing about. The reel is held in the right hand and serves as a short rod, while the scoop is held in the left hand and used to keep the hole clear of the scum new of ice which, of course, is constantly forming. The line is kept in constant motion, jerked up quickly a short distance and then allowed to drop back, so that the little fish that are nosing about the white "jigs" after the manner of codfish, are hooked about the jaw or in the belly.

As soon as a fisherman feels a fish on his hook he catches up a bight of the line with his scoop and another below this with his reel, and thus reels up the line on these two sticks in loose coils till the fish is brought to the surface, when a skillful toss throws him off the barbless hook on the ice, where he gives one convulsive flap and instantly freezes solid. The elastic whalebone line is thrown off the sticks without tangling, and paid out through the hole again for another trial. If fish are not found plenty at the first hole the fisherman shifts his ground until he "strikes a school." They are sometimes so plenty that they may be caught as fast as they can be hauled up. One woman will frequently bring in upward of a bushel of the little fish—they are generally about five or six inches long—from a single day's fishing. This fishing lasts until about the middle of May, when the ice begins to soften. A good many are also caught along the shore in November in about a foot of water when there are tide cracks in the ice. At this season the Esquimaux use a little rod about two feet long with a short line and a little ivory squid at which the fish bite.

During the summer, many of the natives are encamped in tents at a place called Perginak, just at the bend of Elson Bay, and after the ice leaves the bay, gill nets are kept constantly set, and visited from time to time. In these they catch whitefish chiefly, *Coregonus laurettæ*, a few salmon, *Oncorhynchus gorbuscha*, and another undetermined species, and occasionally large individuals of a sea-run form of *Salvelinus malma*, the Pacific red-spotted trout.

This fishing lasts from the middle or end of July into September, but is never very productive. The trading parties that go east to the Colville River in the summer, also catch large quantities of fish. *Salvelinus malma* was so abundant in the summer of 1882, that the dogs were fed with it.

Another food fish appeared on the coast in the summer of 1882, which appears not to be utilized by the natives as they have no nets small enough to catch it. This is the caplin, *Mallotus villosus*, which we netted by the thousand in the outlet of the lagoon close to the station, and found most excellent eating. The natives who live on the river running into Wainwright's Inlet, seventy miles down the coast, also catch through the ice a good many smelts, *Osmerus dentex*, which are as delicious as the smelt of our coast. Fish, when cooked at all, are always boiled; as, indeed, all Esquimaux food is, but many are consumed raw or frozen. Very little of a fish is wasted except the scales and perhaps the larger bones.

To close my account of the fish of this region, it may be well to say that the Esquimaux tell of a large lake between Point Barrow and the Colville, in which there are fish "as big as a kaiak." This certainly has the appearance of a "fish story."

NOTES PERTAINING TO FISHCULTURE.

[A paper read before the American Fishcultural Association.]

BY JAMES ANNIN, JR.

Gentlemen and Members of American Fishcultural Association:

It is with keen regret that I find at the last moment that I shall be unable to attend this, the thirteenth annual meeting, especially after such care and pains have been taken by the committees in charge to make it of great interest and profit. Business prevents my preparing an extended or elaborate paper and I but briefly call your attention to one or two subjects.

The California, or rainbow trout, are they a success in waters of the Atlantic coast? In one stream in which they were planted some five or six years ago I consider that they are not. I have reference to Caledonia Spring Creek, Caledonia, Livingston county, N. Y. This stream has contained them longer than any others east of the Mississippi River, but to-day you can catch no more, and no larger ones than you could the second or third year after the first plant was made. Where have they gone? I have not answered it satisfactorily to myself yet. They could not have been all caught out as the stream is preserved. From observations the writer thinks that many have gone down, finding their way into the Genesee River and Lake Ontario, just as the California salmon did several years ago; they have gone as suddenly as the salmon. Stories are afloat of large ones being caught miles below. As the spawning season approaches they also run up stream just as far as they possibly can, and as the stream is generally at its best at this season they cannot get back unless they do so before the water subsides. I have often found them in water holes that had no connection with the stream except during high water and where they would die in a short time. I heard of one found in a man's garden this spring that was nearly a mile away from the stream, the fish had gone up there in a little stream that was formed by melted snow and rain, and which run dry in a week. Brook trout generally find their way back and don't get stranded. You would suppose that the natural increase would keep the stock up in a preserved stream, but it does not in this case, and here I would call your attention to the fact that at the best, not more than 50 or 60 per cent. of the many rainbow trout eggs taken at the hatcheries at Caledonia can be impregnated. There is no such percentage of empty eggs of others of the trout family that are handled here.

During the past winter I made an experiment with eggs taken from a fine healthy brook trout; impregnated by a number of good males of the same. First, I took 350 of her eggs, placed the milt with them and then washing it off as quickly as possible, and forty-five seconds after taking the eggs placed them on the screens in the hatching trough. Next, I took 350 more eggs from the same fish and let them stand three minutes before washing off the milt. Next, the remainder of the eggs the fish contained, 335 in number, I let remain in the spawning pan the usual length of time—about thirty minutes. The three lots I carefully placed on trays; picking out the bad ones every day, until they were old enough to plainly show the eye spots, when I counted what I had left of each of them:

First, which had an exposure of forty-five seconds, only 6 were impregnated.

Of the second, with exposure of three minutes, 31 were impregnated.

Of the last, thirty minutes exposed, 208 remained that were good.

This is only the result in case of one fish, but if it should prove the same in all, is it any wonder that fishculture is a grand success?

SHAD HATCHING IN CONNECTICUT.—The catching of shad for the purpose of securing the spawn for artificial propagation on the Housatonic River, closed about July 1. Mr. Fenton, who has had charge of the hatching, gives the New Haven *Palladium* some very interesting facts in regard to the mode in which the business is conducted. The total number hatched out and deposited in the rivers will exceed 3,000,000, of which one half have been emptied into the Connecticut River, at Enfield Bridge, and the remainder into the Housatonic. Mr. Fenton estimates the average number of eggs secured from each fish at 30,000, although at least in two cases he has secured fish that had over 60,000 eggs each, the eggs from the two fish filling a common sized milk pan. The fish are emptied into the river at the turn of the flood tide so that, as the tide goes out, the young shad are carried down the river far enough so that the impurities emptied in the river from the paper mill may not kill them. Mr. Fenton seems to think that the acids discharged in the river are not so destructive to fish as generally supposed, and says in support of his views that several days since, just after the hatching of several thousand shad, the vats of the paper mill were discharged into the river while the tide was rising and consequently the impurities were forced up the river to the hatching boxes, a few hundred yards above the mill, filling them with impure water so that the young fish could not be seen; but after the tide went out and the water became pure no perceptible harm was done the fish. Besides the young shad placed in the river here, the United States Fish Commissioner had placed 1,000,000 fish in the river at Milford, although he is doubtful if many of these live to reach the Sound, as not only do they have to run the risk of being devoured by the bass and pickerel in the lake, but the passage over the dam, during the month of September, when the water is low, is doubtful, and if they take to the canal and pass through the water wheels of the different shops they go to sure death, as has been demonstrated at Windsor Locks.

WISCONSIN.—The Fish Commission of Wisconsin has hatched and planted 2,000,000 brook trout, 2,000,000 mountain trout, 10,000,000 wall-eyed pike, and 17,000,000 whitefish.—BADGER.

The Kennel.

FIXTURES.

BENCH SHOWS.

Sept. 9, 10 and 11.—Third Annual Bench Show of the Montreal Kennel Club. Chas. Lincoln, Superintendent. John F. Campbell, Secretary, P. O. Drawer 1,955, Montreal, Canada.

Sept. 16, 17 and 18.—Collie Bench Show and Field Trials of the Ontario Collie Club, Toronto, Ont. Entries close Aug. 23. Mr. H. J. Hill, Secretary, Toronto.

Sept. —. Bench Show of the Philadelphia Kennel Club. Mr. Benj. C. Satterthwaite, Secretary.

Oct. 8, 9, 10 and 11.—Third Annual Bench Show of the Danbury Agricultural Society, Danbury, Conn. E. S. Davis, Superintendent, Danbury, Conn.

Oct. 21, 22, 23 and 24.—First Annual Fall Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Chas. Lincoln, Superintendent.

FIELD TRIALS.

Dec. 8.—Sixth Annual Trials of the National American Kennel Club at Canton, Miss. D. Bryson, Secretary, Memphis, Tenn.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1407.** Volume I., bound in cloth, sent postpaid, $1.50.

POINTERS AT NEW YORK.

Editor Forest and Stream:

Mr. Tracy's reply to my last contains nothing but irrelevant matters and is too weak for me to notice further, beyond my saying that Thunder has no field trial record, and that he was made notorious by a newspaper, the editor of which has publicly proved his ignorance of dogs ten thousand times over.

I should have answered Mr. Munson before this, and have only waited until this late hour in the day expecting him still further to commit himself. Give him rope, said I, and he will hang himself; he has fulfilled my prophesy. A well-devised scheme for transferring this discussion to the columns of a contemporary has failed. The controversy must be brought to an issue on neutral ground, and in the columns of a paper conducted by gentlemen.

A word here about the protest will be in order. An attempt is being made I am told by some unscrupulous individuals, to convey to the public the impression that the protest was proposed and framed by me on account of the decision which gave the money in the champion large class to those interested in Meteor. This is a deliberate wilful misrepresentation of fact, and is a report which is circulated for reasons obvious to all. Not only were those who indorsed the protest distinctly informed that it was general in its meaning and did not apply to any one decision in particular, but the very wording of it is sufficiently comprehensive to place it beyond misconstruction by any person possessed of ordinary common sense. Some people, however, have none. The protest reads as follows: "*We*, the undersigned *exhibitors and breeders* of pointers, request you to place on record in the pages of FOREST AND STREAM *our* disapproval of the *awards* of Mr. E. C. Sterling, at the New York dog show, held in Madison Square Garden, May 6, 7, 8 and 9, 1884." The italics are mine. Does such language not equally apply to the unaccountable decision which gave the champion small pointer bitch prize to a rank bad one—Vanity; and do such lines not apply with equal force to the absurd decisions in the open classes?

A great laugh will go up on some irresponsible meddler when it becomes generally known that the protest was not suggested by me at all, but by a gentleman who was most outrageously treated, and whose exhibit was placed behind an animal entered for competition in Mr. Munson's name. Let it be known, however, that I am willing to take every ounce of responsibility attached to that protest on my own shoulders. It was framed in the interest of the public, and of pointer breeders and exhibitors throughout the length and breadth of this great country.

Let it be known, also, that I do not fear either the cowardice, the abuse or the slander of a Punic press, and that I am not to be retired with Mr. John Davidson's pension, though I would appreciate the honor of being found in such company, for there, I am told, do good dog lovers dwell. I will write something more about the protest on a future occasion.

Mr. Munson admits he has never bred a good dog, and for that reason it may surprise some people why I notice him. In his case I find it a duty to reply, a duty to myself, a duty to

my brother lovers of pointers. He has misrepresented dogs, forfeited every confidence ever placed in him, and demonstrated beyond the question of a doubt that unless things are altered dog shows must degenerate into a complete farce, if indeed, they have not done so already.

Mr. Munson tells us there was not a "well-informed pointer man" among the spectators who did not see at a glance how far superior Meteor was to Beaufort. Mr. Munson cannot name one single pointer judge who indorsed that decision. Is Mr. Waddell, the well-known Western breeder, well-informed, and what did he say about Beaufort? Here it is: "The best large pointer I have ever seen." Is Mr. Edmund Orgill (probably the best judge in America) well informed, and what did he say? Here are his own words: "A grand fellow—same stamp as Faust and Bow, but beats them all to pieces—the best I have ever seen—should like to breed to him." What did Dr. Strachan say? and what was Mr. Steel's opinion? How about Messrs. Gregory, Garrett Roach, Satterthwaite, Lamb, Tallman, Martin, Phelan, and a hundred others I could name. Is Mr. Thos. Orgill well informed, and what is his opinion? "I call Beaufort a grand dog, and fail to see where any one can find fault with him. In my judgment he is the best-looking large pointer in America, in which opinion I am backed by my father." Americans give Mr. Wise credit for knowing a pointer, and that gentleman has said, "He (Beaufort) could win anywhere," and that Beulah, the dam of Beaufort, is one of the best bitches living in the field. Now for the press. FOREST AND STREAM has said, "We consider him the best-looking pointer that we have ever seen. We are assured by several gentlemen who have seen him at work, that he is also an excellent field performer." The *Kennel Register* holds a similar opinion, and *Turf, Field and Farm* did not indorse the decision against him. The London *Field* says, "These questionable decisions positively sink into insignificance compared with what Mr. Sterling did with the pointers * * * altogether we must say that more dissatisfaction we never heard expressed at any single-handed judged show. * * * The pointer awards were dealt out in a strange fashion by Mr. Sterling. He began with large champion pointers, and Mr. Munson's Meteor beat Beaufort, Knickerbocker, Don, Croxteth and Perth. Meteor was decidedly outclassed in such company. He has been the subject of a good deal of controversy, and at Toronto he was shown in another person's name, but here he was, by coming in as Mr. Munson's, rendered eligible for some extra prizes. He is bad in head, wants squareness, has a bad eye, ears set on too high, shoulder blades wide apart at the top, shallow chest, short back, and a badly carried tail. * * * Croxteth also is much better than Meteor. * * * Beaufort was decidedly the best dog of that class." The only paper that indorsed the decision was the one in which Messrs. Munson and Sterling have a large sum of money invested. If I am wrong in this statement let Mr. Munson deny it under his own signature.

Mr. Munson does not see any "honor" in Meteor's beating Beaufort—neither do I—but let me say right here that Meteor never did beat Beaufort. Beaufort's reputation does not rest on my advertisement that he is the handsomest pointer in America. It rests on the fact that he is the grandest pointer ever seen in the opinion of the best judges and every independent paper. This is the more remarkable when a clique, assisted by a newspaper editor, has undertaken to annihilate both dog and owner. Mr. Munson is wrong when he predicts the New York show was Beaufort's Waterloo. I am inclined to the opinion that it was Messrs. Munson and Sterling's Waterloo.

It was reported before the N. Y. show that several members of the W. K. C. had pronounced Meteor a very inferior specimen, and it is well known that Mr. Munson expressed a similar opinion of Bang Bang. Unfortunately I have not in my possession documentary evidence to sustain me in regard to Meteor, but I hold proof that before the *tête-à-tête* in New York Mr. Munson considered Bang Bang a very ordinary animal. Was a tacit understanding arrived at between Mr. Munson and the Westminster Kennel Club, whereby Mr. Munson was to pronounce Bang Bang the best small pointer in America and the club reciprocate the kindness by sending Meteor off as the best large pointer in America? I am guided to such a conclusion by the following documentary evidence, which will also explain how Beaufort was placed behind Mr. Munson's exhibit, entered in the catalogue as being by Garnet out of Jilt. Mr. Munson writes in your paper of June 12 as follows: "I am willing to go on record as saying that Meteor and Bang Bang are (barring the head of each, which, I think, could be slightly improved) the best pointer dogs in America, and the only type of the pointer to breed to." Mr. Munson here admits Meteor and Bang Bang to be of the same type, and to be perfect excepting in head, in which respect they could, in his opinion, be slightly improved. I take him at his word. Let us now see what Mr. Munson wrote about Bang Bang in April, before he had "arranged matters" with the Westminster Kennel Club:

ST. LOUIS, April 9, 1884.

Charles H. Mason, Esq., N. Y.:

DEAR SIR—I expect to catch fits in the papers for passing Bang Bang by at Cleveland, but I am sure I put the ribbons where they belonged. I am not pleased with Bang Bang. * * * I am told Beaufort is a remarkably handsome dog. Yours truly,

JNO. W. MUNSON.

ST. LOUIS, April 15, 1884.

DEAR SIR—Your favor of the 12th to hand. If I had thought Bang Bang the best dog at Cleveland he would have won first. I thought him good enough for second only. I don't fancy his head—especially his front face—and eyes. The latter are black and cocked, showing the inside white of both when he looks at you. I don't think his tail good, nor his throat. In fact, I don't think him a first-class dog.

Very respectfully,

JNO. W. MUNSON.

Now, it is my turn to go on record, and I go there as saying that Mr. Munson forfeits forever the good opinion of every pointer breeder and exhibitor in America, and he will never enter a judging ring again. I do not wish Mr. Munson to tell us that Bang Bang was not in condition when shown at Cleveland, for bad condition would rather hide the faults he alludes to than otherwise. Mr. Munson's written opinion of Bang Bang in April was impartial and honest; he had not met the W. K. C. in New York and had no axe to grind. He thus conclusively proves, supported by the strongest evidence—his own—that Meteor is not a show dog. Why, then, does he object to my criticism of his dog, every word of which was correct? Why also, may I ask, do the W. K. C. refer your readers to Mr. Munson's opinion of Bang Bang?

I now repeat that Meteor is not a show dog and that judges of pointers such as Messrs. Whitehouse, Price, Brierly, Lort, Viscount Combermere and others would disqualify him or any other dog possessed of such a head. I repeat, too, that at the N. Y. show Bravo was the gentleman of the small size classes, and I am indorsed by no less authority than Mr. John W. Munson. It has been a complete mystery to me how men who have had true pointers, such as Faust, Bow and Keswick, before their eyes, could come forward and tell us that Meteor and that rank bad bitch, Vanity, are pointers at all.

The whole business is now explained. The love I have for my pointer, and a sense of duty compelled me to publish Mr. Munson's letter or I would not have done it. Important as are such matters to everybody interested in the breed, there is another question yet to be settled, a question closely allied to improvement, a question of grave importance with us all, and I now call on Mr. Jno. W. Munson, or whoever the owner of Meteor may be, to show in a clear and straightforward manner that Meteor is by Garnet out of Jilt, as advertised by Mr. Munson in the public stud.

CHARLES H. MASON.

TOMPKINSVILLE, July 14, 1884.

Editor Forest and Stream:

I cannot pass over the unfortunate complexion the discussion of the pointer award at the late Westminster Kennel Club show has assumed, and must severely condemn the acrimony that pervades the majority of the articles written pro and con, and above all the ungentlemanly accusations and aspersions reflecting on the honor and character of the gentlemen who generously braved the dangers of past experiences. One word as regards type. In my humble judgment the sole typical pointer from A to Z, I would respectfully refer them to imported Snapshot, dead and worthless so far as individual field qualities are concerned, but he was *par excellence* the pointer so far as form, of the day. I am not going to criticise Beaufort, Bang Bang, Meteor, Croxteth or others, but I cannot overlook the fact of the childish peevishness displayed in advancing as a damaging argument the quibble that Bang Bang begets black and white progeny.

"Mad let us grant him then; and now remains
That we find out the cause of this Effect;
Or, rather say, the Cause of this Defect;
For this Effect, defective, comes by Cause."

Certainly this coloring in the progeny is foreign to the argument under discussion, and assumes the farcical phase of the two little hoodlums. When one threatened to whip the other for throwing stones at him he yelled back in defiance, "Well, I'll call your sister names." If a man should breed to Wyandotte Smythe's pointer Bellicose, whose sire was one of Lang's celebrated black pointers, or Mr. Whitman's, or Old Phil, an orange or white or lemon and white pointer bitch, and among the result of this union came one or more black youngsters, would it damn the litter or prove a *casus belli?* Well I guess not, stranger. That men who wish the world to recognize them as breeders, judges and sportsmen should stoop to such cavil seems beyond the comprehension of intelligence. Then again, gentlemen, you are switching on a siding when you drag in the merits of the deeds done afield by one or the other; in a case like this it is but a secondary issue at the best. My good friend Donner harps on the ivory and texture of the bone. Is the outward size a sure indication of the quality, or is it impossible for a small bone to be spongy and porous like the large, or *vice versa?* I am seeking enlightenment in this quarter. I am hungry, Mr. Donner, but feed me sparingly of ivory, as my masticating powers are but mediocrity. Brother sportsmen, in a case like this, look straight over the gun barrels, hold right on, fire away if loaded with powder of truth, charity and justice, and take my word for it, you'll hit the bullseye every time, and the recoil won't be felt.

WASHINGTON A. COSTER.

FLATBUSH, July 13, 1884.

Editor Forest and Stream:

I have been an interested reader of the controversy going on in the columns of your paper relative to the pointer judging at the late show of the Westminster Kennel Club, held in this city. Instead of confining themselves to the merits of the question under discussion, certain individuals have converted it into a mere personal wrangle, and made it the channel through which to bring odium on a gentleman whom but to know is to esteem. I refer to Mr. C. H. Mason. In a Western paper I find a number of columns devoted to the very chivalrous work of hurling abuse and epithet at Mr. Mason. Any one who is at all conversant with the style and tactics of that great exponent of knowledge, and will take the trouble to look beneath the surface of the article alluded to can only see therein an under-stratum of petty malice, hate, and cowardly imuendo. Doubtless this doughty editor thinks it brave to sit in his office and hurl mud at a man a thousand miles away, and then deprive him of the opportunity to defend himself by closing the columns of his paper against him. And what crime, pray, has Mr. Mason committed, that should call forth this great onslaught upon him? From the moment his calm and temperate criticism of the pointers at the late show appeared until now he has been a target for shafts of fury and hate from all quarters. Where is the pointer breeder or lover that will not admit the justice of his criticism or does not feel indignant at the distribution of awards at the late show, in awarding the ribbon to the nondescript Meteor over the pointer Beaufort, or to Vanity over such bitches as Lady Bang or Duchess? Where is the judge of a pointer who will say that those were awards of merit?

It does not weaken the published protest one particle that a portion of the signers were non-exhibitors. Any man who has the interest of the breed at heart had a right to protest against such infamous judging. Neither does all the abuse hurled at Mr. Mason weaken his statements, they stand out pillars of truth supported by plain facts and sound logic. The statement made by the writer to whom I have alluded, that Mr. Mason is not a breeder, is false, reference to the English Kennel Club Stud Book will conclusively prove that he has bred winners at the best show in the world, the Birmingham show, which takes precedence over all others. This unprincipled attack upon Mr. Mason will be the cause of drawing around him a host of defenders. American gentlemen love fair play and justice to all.

T. H. DWYER.

NEW YORK, July 15, 1884.

Editor Forest and Stream:

In your issue of the 3d inst. Mr. Mason takes occasion to again attack Thunder, and this time slurs the field qualities of the dog.

He has persistently hounded after this dog for a year or two, all of which I bore in silence, knowing that the reputation of the bench qualities of the dog could not be injured by anything that he could say.

So long as he confined himself to dissecting (no matter how he hacked him) the form and general appearance of the dog, it mattered not; but when he, not satisfied with that, has the presumption to publicly state that the dog has no field qualities it is quite time for me to speak.

I most emphatically declare Thunder to be a most excellent a field dog.

That he has no appearance of idiocy, but, on the contrary, possesses as much intelligence as is usually found in dogs.

How and why a man, who never saw a dog at work in the field on game, can publicly assert him devoid of quality, and, even when the records show the contrary, passes my comprehension.

Mr. Mason has posed as a self-constituted judge of not only dogs, but of the gentlemen who have been kind enough to judge them. Will the gentleman now assume the attitude of sportsman and field trial judge?

Perhaps he may make it appear that the writer is no judge of field dog.

E. S. WANMAKER.

ELMWOOD, N. C., July 7.

Editor Forest and Stream:

A Western contemporary, in a six-column editorial, devoted to slandering Mr. Mason, advertising the Munson kennel, and telling us what a wonderful man the editor is, gives it out that Mr. Mason has never won prizes at the best shows or bred good dogs, and consequently cannot be a judge of dogs. The English stud books, which are not "in the printer's hands," prove that Mr. Mason has won the highest honors at shows, and bred the winners at Birmingham, Crystal Palace, Manchester, etc. I find that in 1876 Mr. Mason won first in both the large classes at Birmingham, and was breeder of the first and second prize winners in one class, a record I believe to be unequaled. He won the champion prize at the same show the year following and bred the Crystal Palace winner Marquis, who also won first at Birmingham. Mr. Mason's name appears as the owner of the winning dog at the Crystal Palace, 1880, and to go through his entire list of winnings would fill one issue of your paper. I believe that a man to be a judge must have owned and bred good dogs. Until he has accomplished this he must not assume to teach others. Will your Western contemporary reciprocate my kindness and tell us what good pointer it has ever owned or bred, and what sort of company its dogs have been shown in? The editor might have found Mr. Mason's record by reference to the English stud books, but possibly he does not keep them, in company with the subscriptions to the National American Stud Book—in his pocket.

FAIR PLAY.

SHOOTING OVER BEAGLES.

Editor Forest and Stream:

Having for a number of years given attention to the breeding of beagles and collies, and their proper education for field work, I became much interested in articles recently published in your paper upon "The Proper Size of Beagles."

As regards size, I herewith indorse the article of Mr. Pottinger Dorsey, in one of your late issues.

It has been my pleasure in times past, in company with Mr. Dorsey, to enjoy very many days' sport "across the glen and upon the hillside," with our beagles "roading up" and chasing the timid yet swift rabbit. On account of strength, hardiness, industry and energetic work, I think it imprudent to reduce the size (height) below thirteen inches (I refer to beagles, not bassets, and I furthermore refer to beagles as used for rabbits exclusively).

As regards the practice of shooting rabbits before a pack of beagles, I am of the opinion, based upon observation, that the practice is pernicious, and if persisted in may render a pack comparatively useless, and often cause the pack to bolt a hot foot when a neighborhood boy shoots at a chipmuck or robin.

I do not consider a pack of beagles properly qualified for field work if they have not the stamina to either kill or send everything that starts to the ground or hollow log. If "puss" gets under cover let her go; start a fresh one; she'll be out another day. Besides, dogs become more thoroughly in earnest when permitted to mouth their game, and to a sportsman the sport does not consist in the amount of game killed, but in the manner in which it is done.

If the pot-hunter desires a quantity of rabbits he starts out with a cur of his own, borrows a half-dozen more from some neighbor, and with the lot can under-run every brush-pile, bark around every bog, and start up every living thing in a neighborhood, and of course the master of ceremonies can sneak up and get a shot, and go home with a bag full of prey.

The object of keeping a pack of beagles is sport as exemplified in the chase. Certainly any gentleman can become interested in watching the search for cold trail of the night before and the maneuvering of the pack to "road up" puss; presently the "fresh trail" is felt, the signal note of the chase sounded, and away they go in line, the scent being yet low down. Puss shows up at every turn. Shall the pot-hunter with his gun cut short the sport at the start? Do not do it. Wait a minute, puss feels anxious and begins to warm up, her "foot" is hot and the scent floats high. Now note the pack, lining or trailing is done; each dog is pushing for the lead. Here they come, three, four, six abreast, noses up, necks outstretched, giving tongue most gloriously. Such music. Note and tone more harmonious than the bang of any shotgun. The chase cannot long continue at this speed. Let it end! What matter how? Puss in the bag or safely sheltered in the groundhog's home. Is not the sport in either case the same to a true sportsman?

Does the master of a pack of foxhounds permit reynard to be slaughtered by lead? No! Just as the fox and hounds is to the mounted sportsman, so should the rabbit and beagles be to the sportsman on foot.

I remember a two-days' hunt in company with Dr. J. W. Downey, his brother Frank, and some gentlemen from New York city, in Berkley county, Va. During the hunt we had sixty starts and bagged fifty-six, and scarcely any of them were shot.

We may sum up as follows the disadvantages of shooting game before a pack: First, deprives the sportsman of the pleasure of the chase; second, causes the pack to be careless in hunting for a lost or over-run trail; third, loss of animation by not freely mouthing game; fourth, causes inattention to business, by "harking" for the gun, all of which render a pack almost worthless for true sport.

F. C. PHEBUS.

BERNARDSVILLE, N. J., July 10.

THE LAVERACK SETTERS.

DURING the controversy which took place a year or so since between the adherents of the Laverack setter and the breeders of the field trial or what has been lately termed the Llewellin setter, it was my intention to have added to the long list of writers who ably defended their respective favorites that which I had learned of the first-mentioned dog, but press of business prevented it. It may not be amiss at this late date to relate my experience with the Laverack setter, several of which I both imported and bred. It would seem that Mr. Laverack, jealous of the high standard he had attained in breeding his dogs and anxious that his setter should still hold the position they had gained under his management, overstepped the limit and continued his inbreeding to such an extent, that where he improved their wonderful scenting power and more firmly stamped their natural tendency to find and point game, he multiplied that nervousness to which all inbred animals are prone until shyness of the gun has become such a part of the nature of the breed that it is an exception to the rule when the timidity in this particular does not show itself. Were it not that the Laverack setters have with me evinced intelligence in many ways, I would term the nervousness an idiocy, but so convinced have I become of their good sense in other important points, I would select as a stud dog a pure Laverack for certain bitches, in order to procure in the progeny the exquisite scenting powers and innate faculty of pointing game the youngsters of this most famous breed possess.

I cannot make a better comparison in regard to the intense nervous organization of the Laverack setter when I liken the timidity the breed as a rule exhibits at the report of a gun or any sudden sound to a human being fearful of a thunder storm and not being able to overcome it, knowing the while he is enjoying full as much safety during its prevalence as his surrounding companions. So marked has this peculiarity shown itself to me that I detect it most frequently (far too often) in the field trial or Llewellin breed of setters where there is a preponderance of Laverack blood in them, and they show the typical points of the older breed. While the Laverack setter is apparently courageous when allowed his own way in the pursuit of game and self-willed in his method, he will bear no correction. It becomes, then, a most difficult task even with the cord to train him to obedience or by taking advantage of his affections to guide him as he should go. In all the setters of this breed that I have owned or ever saw there seems to be a want of knowledge on their part that their powers should be coupled with those of their master in order to render themselves useful. In my opinion, no setters are better formed for speed and endurance than the Laverack, and the only breed that is marked in typical points. The Llewellins so widely differ in this respect, it is a question with me if they yet deserve the distinctive title they bear, and just here is the proof that Mr. Laverack, breeding to gain that which in his estimation was to be desired in a setter, accomplished his object. In reaching this point, however, continued inbreeding was resorted to and resulted in both increasing good quality and intensifying nervous temperament.

It is not my desire to have this short article taken as an attack on the Lavercks. I consider the breed valuable beyond question. In the stud they are priceless, in the field useless. I have now in my possession several letters from Mr. Laverack, written to me not very long before his death. All through these epistles there runs a vein of matter which plainly shows that he was fearful the dogs I purchased from him would exhibit the same timidity and shyness of the gun many of

his own must have done, mating as he was at the time, unless I was very careful in handling them. His instructions, minute and involving much time, were carried out to the letter, and but one of my importations proved of any value in the field, and she (Magnet), litter sister to Fairy II., became what she was only by long and continued cautious treatment. I must repeat again that the scenting powers and innate desire, and I would say the determination to hunt, of all the Laveracks I ever saw, was phenomenal, and herein consists their very great value to breeders in this country, yet I would warn sportsmen not to cross them where the same blood is very prominent. We must use the Laverack setters to improve our native stock; judiciously mate them, and for this purpose they will be most useful. HOMO.

MISTAKE IN PEDIGREE.

Editor Forest and Stream:

The pedigree of the pointer bitch Fancy, said to be by Croxteth ex Royal Fan, about three years old, and so advertised by Mr. Miller, is undoubtedly a fraud, from the fact, corroborated by Mr. Dilley's letters on the subject, and my personal knowledge, that the only bitch of that breeding was sent to me. This bitch pup was whelped Nov. 27, 1881, at Mr. Dilley's kennels, Rosendale, Wis., was liver and white, and I kept her in my yard till quite large, then I passed her over to a friend, Thomas F. Connolly of this place, to break and train for me. During that early fall I sent her to a friend in the South, to work her on quail. After some time I received a letter from him stating that she was so gun-shy and intensely nervous of every noise that she was worthless. I wrote for her and told my friend Hamilton he could have her under certain conditions, as I did not want to bother with her any more. He disposed of her, and at this present date of writing says he can produce her in New York city in four hours. This bitch is the only one that came East, beyond a doubt. Therefore, the only construction in accordance with the facts in Mr. Miller's explanation, is that Mr. Callender has been made the victim of a rascally imposition, and in all innocence has transferred with the bitch Fancy this imposition to Mr. Miller. Who the originator of this is, deponent saith not, but one thing is sure, whoever it is, all subsequent purchasers have been most shamefully duped, and I feel it my duty to advise Mr. Miller to ferret out this originator. I will cheerfully give and obtain all facts, dates, etc., and personally aid him with my best endeavors. He has my sincere sympathy, as I have suffered some few years ago in the same manner. W. A. COSTER.

FLATBUSH, L. I.

ENGLISH KENNEL NOTES.

IX.

MAIDSTONE show has given us plenty to talk about. The entries did not reach 500, and the attendance on both days fell equally short of expectation. I trace the falling off in entries to two causes. In the first place there are too many shows advertised this year, and owners of valuable kennels justly decide that their dogs can't stand the racket. A show is a great strain upon a high-bred dog's system. Your dogs generally lose a pound or two in flesh from pining and the confinement.

I know that at most large shows they announce in their schedules that the dogs will be taken off the bench once a day to ease themselves, but I have not much faith that this is carried out. Take the Kennel Club winter show at the Crystal Palace, for instance. The dogs are benched in the galleries within the palace. It would be an impossible task to loosen 1,300 dogs daily, lead them down the staircase, through the palace, its corridors, and thence into the grounds. I am sure this feat is not attempted, nor do I think the Crystal Palace Company would allow their grounds to be used for such a purpose. What happens then? Why, your dogs are hitched to two feet of chain, cooped up in a few square inches of room for four days and nights. This unsanitary confinement shortens the days of show dogs. We cannot be too grateful, therefore, to the Warwick executive, who provide a large inclosed green to which all the dogs are regularly taken out for exercise, etc

I am aware that there must be difficulties in the way, but surely it is playing rather small for the Kennel Club to even have others set them such an example, and still more pitiful that they are unable to follow it. The club is rich, why do they not purchase a piece of ground and put up an iron building. If they chose a plot in a good neighborhood, they would probably be money in pocket at the end of the year by letting it for flower shows, bazaars, and other shows. They should also have their own benching and fittings. If the Crystal Palace Company were to refuse to allow the Club to hold their shows on their premises, I think the committee would be at their wits' end. Where could they go? The Agricultural Hall is closed to them, the neighbors objected to the uproar made by the dogs, and obtained an injunction. The Alexandra Palace, the best of all places, is closed. There might be another place; I remember some two years ago, the late General Burnaby, uncle of the author of the "Ride to Khiva," showed me some plans for the construction of a huge building on the Agricultural Hall plan, in Kensington near the Addison road. It was designed to be let for the Royals and other big shows. I have not heard of it since his death, and don't know, therefore, if the works are in progress, or if even they were commenced. London is really in need of a large show ground.

It is surprising that this subject of not taking the exhibits off the bench has not excited more attention in a kennel press ever ready to encourage the ventilation of subjects that lead to prolific discussion and make capital "copy."

In all our catalogues one reads among the regulations: "Any person found untying or removing a dog from its number during the hours the exhibition is open, without the permission of the committee, chairman or secretary, will be expelled from the show; and if an exhibitor, the dog so removed will be disqualified from winning any prize at the show." This rule, however, is wisely not too strictly adhered to. Most exhibitors take their dogs off for a minute or two and that is long enough for the purpose. There is another way of looking at it of course, and that is from the public's point of view. They have paid their entrance money to see the dogs and they feel disappointed and consider they have been treated with bad faith if they find empty benches under prize cards, but the next time they come round that way they will usually find the tenant returned, looking all the better and more comfortable for the few minutes he has been down. But there is another regulation that I think managers should not yield upon, that is not to allow owners on the last day of the show to remove their dogs before the time advertised to the minute. I know exhibitors, particularly those of the sex, incorrectly, so far as concerns those who show dogs, described as the weaker, pester and wheedle the good-humored secretary to "let me take my dog out at half past four; will you, please, I've got to travel forty miles and I'm very anxious to get home to-night, which I shall not do if I miss this train," but the official should be firm, for if he gives them a pug they'll take a mastiff, and it is an intolerable nuisance to the public, who are quite prepared to clear out of the show at the hour they know it will close, and who came in expecting to have a quiet look round till that time, to be hustled and bustled by selfish dog owners hustling along through the gangways with their four-footed obstructions. They are "going to catch the train," so get out of the way. Here comes a man leading six collies; you screw yourself against the bench to let him pass, feeling very nervous, because you have heard collies are treacherous dogs, when one, a nervous bitch perhaps, starts round your legs. While the owner tries to disengage the poor creature that is now flying about in a frightful state of excitement, the others are jumping up at you. Another fellow comes along with some fox-terriers, who immediately fall out with the collies, and you dance about in a surging mass of canine profanity, treading on everybody's tail and getting snapped at generally. You will feel quite relieved when you are released from the confusion of chains and breathlessly jerked on to a bench where, while you lie panting, the occupant, a sedate bulldog, will patiently chew your coat collar. When the collie man and the terrier have told you all they could think about your clumsy conduct, they will leave you to struggle out to seek caustic for your wounds and needle and thread for your breeches. When you get home you will probably recall the story of the young diplomatist who was sent out to a new colony to report upon the customs of the natives. The dispatch he sent home will strike you as applying with some truth to doggy men: "They have no manners and their customs are beastly."

Maidstone again. Another fact to account for the few entries is, that the Palace show was fixed for a few days later, and many did not think it worth while to give dogs a gruelling at Maidstone that had a good chance at the Palace. The attendance was so meager as to lead one to seek for local reasons. The secretary lacked neither zeal nor energy, but I think he was deficient in experience. On a former occasion the show was run by two local doggy men, Mr. Towsley, a St. Bernard breeder, and his partner, Mr. Carr. They made a good thing out of it. This time, as usual, the committee stood the judges a dinner. I have tried to find out what happened at the dinner, but I knew nobody who was present intimately enough to ask. I suppose there were the conventional speeches. I hear that the chairman did his share, that Mr. Mellor replied for the judges, "Capting" Langdale (who also judged) for the press—Mr. Langdale's title is not a military one, but it is explained that the sons of the clergy are all "captings"—and Mr. Krehl for the successful exhibitors, and a member of the committee for the disappointed exhibitors. That seems rather hard. The party, I hear, was a jovial one, and only broke up when the light went out.

The awards were well received. Mr. Mellor, as usual, had most of the hard work. The St. Bernard classes were not quite up to the mark in quality, and as Sultan III. was superbly shown, he won in spite of his faults. It has usually been "body he wins, tails he loses" with him.

It was a hard case for the owner of the winning pointer to have his dog disqualified for being overweight. Sir Garnet, they say, was below the stipulated weight before the judging, but when it was over and he had won, his owner gave him a good "tuck in," but the treat cost him the prize, for when the wily objector came along, poor Sir Garnet turned the scales. Hard lines indeed, and there's a moral attached to the lesson.

Foxhounds, harriers and beagles gave the show quite a bright and novel aspect. Mr. Langdale here blundered a little, but should be spared censure as he undertook to judge them only to oblige, and confessed he was not well up in those breeds.

The tallest dog I have ever seen made his successful début in the boarhound class. Adric the Saxon was imported by Mr. Pemberton. He is a fine, raking young dog, with great bone, full of muscle, and gives one the idea of immense power, but withal an elegant creature. He has a true head, and the only "but" I heard about him was his color, which is a yellow red. He fairly beat Nero and Leal, both giants. The same kennel supplied the winner in bitches. I have seen larger, but never a truer, more typical specimen than Else.

Mr. Clarke, of Nottingham, won in fox-terriers, with Result, a smart terrier, and the same gentleman I heard claimed a pup in the show for £10 that he declared to be better than Result for whom Mr. Redmond offered £140.

The only unpleasant incident connected with the show was the poisoning of two collies. One of these expired in the show, the other, Sly Fox, who took first prize, was immediately sent home, and as his death has not been announced, I hope for the sake of his owner that he was able to throw off the drug. Of course, the scoundrel will never be discovered, nor have any motives for the crime transpired. The owner of the two dogs, I am told, is a London gentlemen, and popular among his fellows. I hope the fear of having our dogs poisoned is not to be added to the sufficient anxieties that already surround dog shows.

With regard to the proper size of foot-beagles, when I complain of fourteen-inch hounds being too large I am naturally, as "Rusticus" points out in your columns, speaking from the English point of view. I say that when the fourteen-inch beagles break away on the straight they run right away from you and you see none of the fun, and I think that by neglecting the smaller dogs, one body of their admirers will be lost and go ever to the bassets. The basset men are not letting the grass grow under their feet. I have seen in the papers that their club has founded a club hunt. I will write to a friend who takes an interest in the breed, and ask him to get me some particulars of their hunting capabilities. In their native land I know they are chiefly used by shooting parties to put up game in covert. I have also written to some masters of beagles for their opinions. The last time I was in the neighborhood of Tunbridge Wells I saw several good wire-haired beagles, all rather large.

The latest about the fox-terrier bitch claimed by Mr. Clarke for 10 guineas at Maidstone is, that her breeder sold her for 50 shillings to his brother-in-law, who made 100 per cent. on her in getting £5 from the man who has just lost her at £10. What will Mr. Clarke get for her? is now the question.

Correction—In notes of May 20, for Morpe Barham read Thorpe Barham. LILLIBULERO.

JULY 1, 1884.

MR. LLEWELLIN TO AMERICAN SPORTSMEN.

Editor Forest and Stream:

There appears to have in some way arisen considerable misapprehension concerning the class of dogs I have sent to America, which I think it is due, both to the American sportsmen and to myself, to correct. Such correction is necessary, in view of certain willful calumnies which have appeared in a contemporary of yours, founded, as it appears to me, on the use of the word "culls" in a letter from me to an American, who wished to persuade me to sell Count Wind'em a dog which an offer of fifteen hundred pounds would not have parted from me.

The real facts of the case are, that I have invariably kept for myself the first pick out of all litters bred in my kennel, and the second pick I have sent to the Americans. Those inferior to the second pick I have disposed of to Englishmen.

I wish it to be distinctly understood that the dogs which Americans obtained were only inferior to those which I retained for myself, and superior to any which I sent elsewhere. Thus Americans have had the best dogs in the world of my breed, with the exception only of those picked by me for my own reserved kennel. Whatever changes may take place in those dogs which I have sent to America, after they have left me, and encountered various altered surroundings, I have nothing to do with, if any such there may be. The class of dogs sent to America, which I referred to as second choice to my own reserved ones, were of so superior a character that, unless fortunately for me America had not been open to me to send them to, I might possibly have been even driven to the extremity of taking seriously into consideration the question of destroying them. The reasons why I might have been placed in this extremity are the following:

For many years a dead set was made against me, with the object of driving me from the field, by a ring of men whom my great success with this breed at field trials and dog shows had maddened into hostility, and finding that in fair competition it was useless for them to try and put down my breed, they descended to detraction and misrepresentation of all sorts to damn the solid reputation of the breed. Since this was the state of affairs, I determined that as they wilfully denied credit to my dogs for real excellencies which they possessed, they should be compelled to stand to their words, and should not be permitted to enjoy excellencies whose existence they denied, nor to have the chance to improve their beaten dogs by a cross with mine, and then boast that any improvement that might result from such cross was owing to the blood of their dogs and not of that of their conquerors. Until, therefore, a day should arrive when they would be forced by the force of public opinion upon them to fully and freely acknowledge the superiority of my breed, and change their tone altogether concerning them, and should come forward desirous of obtaining them, I would take care that they should not be suffered to procure from me anything like the second choice of my kennel. If therefore America had not been open to me I should have been puzzled to know what to do with those dogs of the second choice, which were too good to fall into the hands of the enemy, and which I could not keep myself, as my kennel was amply stocked with those superior to them, which I reserved to myself.

All those times are, however, passed away, the breed has outlived opposition in this country, and their superiority is now fully recognized, their advance in public estimation, like the incoming tide, has steadily and surely made its way, in spite of all obstacles, until their position is now a fact, whose existence stands simple proof of its being. I am not, therefore, now placed on the horns of the dilemma described above, and no longer need preserve my dogs jealously from being sold in England. I am now free to sell in this country dogs which heretofore Americans only could obtain.

I need merely point to the case of the famous bitch, Countess Bear, which I sent to America, thinking I could spare her, and having done so found I could not do without her, and was obliged to buy her and get her back here again. The class of dog which I sent to America was so near in value to what I kept myself that I sailed too close to the wind sometimes, as in the above instance, and sent away what I afterward found I could not afford to spare. R. LL. PURCELL-LLEWELLIN.

RANTON ABBEY, Stafford, July 1.

THE KENNEL HOSPITAL.

PARTICULAR FRACTURES.

FRACTURE of the lower jaw sometimes happens, and when not implicating both sides is curable. The difficulty is to fix the parts, after approximating the broken ends, so that fluid nourishment can be admitted. This is done by placing between the teeth on either side narrow plates of thick leather and then passing a narrow bandage around the nose and jaw. To prevent the broken end of the bone inclining inward, the hollow between the two sides of the under jaw is padded with cotton wool or tow. It is necessary to obtain exact approximation of the fractured ends, to remove any splinters of bone or loose teeth which are in the way. Having set the jaw properly and bandaged it, not even food or water should be allowed to interfere with the parts for at least a whole day, and then only fluids must be allowed until some reunion has taken place. This will require about ten days.

Fracture of the Nose.—The nasal bones are when fractured always depressed. No apparatus is required to hold them in position when they are raised to their proper place. This can be effected by passing up the nostril a strong metal probe and gradually forcing the bone back to its proper level. Occasionally pointed instruments penetrate the nasal and facial bones. In such cases when bleeding has ceased remove the hair and apply an adhesive plaster. In some instances such wounds do not heal, and a slight watery discharge constantly oozes from them. This is when the duct which leads from the eye to the nose is injured and a lachrymal fistula is established. It is incurable, and the application of caustics or astringents is simply inflicting pain with no chance of success.

Fracture of the Orbit.—Blows just above the eye may fracture the bone arch which forms the roof of the cavity in which the eyeball lies. The bone is depressed, and causes protrusion of the eye. To elevate the bone a flattened steel instrument about the size of a penholder is required. A dentist's tooth-elevator does very well. This is introduced through the skin above the fracture, pushed forward till in position under the bone, and then steady pressure will effect what is requisite. No plastering is necessary.

Fracture of the Ribs is not very common in dogs; even after a cart wheel has passed over an animal it is rare to find any of these bones broken. When it does occur the ends of the bone are usually depressed toward the lungs, and therefore nothing can be done except to place a wide bandage round the chest to limit the movement of the ribs. No pad is to be placed on the site of the fracture, as that would only make matters worse.

Fracture of the Spine is followed immediately by paralysis behind the seat of injury. It usually occurs about the loins, and, when not traceable to direct injury, may be mistaken for paralysis of the hind-quarters due to some other cause. In many cases manuipulation fails to detect the injured spot, and we can then only diagnose the case by the aid of the history, the circumstances accompanying it, and the abscence of other diseases. Paralysis appearing suddenly, being very complete and not responding to treatment in a few days, may usually be associated with spinal injury, and is incurable.

Fractures of the Hip Bones are not uncommon, and can seldom be benefited much by surgical interference. Rest is the great essential, and recovery may be looked for at the expense of some deformity. The advisability of killing an animal with a broken hip depends upon the extent of the fracture and its exact position, and also upon the requiremeuts of the dog. If lameness for life is probable, it is no use treating sporting dogs. Pets, in whom a deformity is not seldom an extra cause for attachment for the owner, may always be treated. Bitches which are suffering from fractured hip bones or pelvis should be carefully examined as to the amount of damage and deformity resulting, as it may be sufficient to prevent parturition. In such cases death can only be the result of pregnancy.

Fracture of the Thigh.—I have referred to and need only repeat, that no bandaging can do any good, and in most cases must do harm. Adhesive plasters may be employed with a view to limit motion, and the dog must either be kept in a confined space or tied up very shortly.

Fracture of the Shoulder Bone is not common. In addition to adhesive plasters, a bandage may be used with advantage to limit motion. It passes first round the chest behind the shoulder, is brought back between the fore legs, and may include the elbow of the injured limb if the position of the fracture renders it advisable.

Fracture of the Elbow.—Strictly speaking the elbow is a joint, but I here use the term to denote a region. It is very far from rare to have a young dog brought for examination said to have "something wrong with his elbow." The history is nearly always the same—a fall from a chair or a table, or down stairs. The elbow is swollen and painful, but no crepitus can be detected. The swelling is not at the point of the elbow, but toward the upper part of the joint. These cases are partial fractures of the lower end of the bone that runs from the elbow upward to the shoulder. There is no crepitus, because the bone is only broken partially through. The end of this bone contains a deep notch, into which a prominent point of the other bone forming the elbow joint fits. The arrangement may be likened to a cleft in the end of a stick into which a wedge is placed. Force the wedge violently to one side, and you fracture one of the extremities of the stick. This is just what happens with the bones. The treatment is to press back the broken part into position, and then retain it there with strips of adhesive plaster. Place the fingers between the body and the elbow, the thumb being

outside on the swollen part, and very little pressure is requisite to nearly replace the broken end. Unfortunately, the fracture is most likely to extend into the joint, and we find as a consequence that this lesion is usually followed by more or less permanent stiffness.

Fractured Claws.—When the skin is broken, and the amount of injury done to the bone is very great, it had better be removed at once with a pair of scissors. When all or many of the bones of the foot are broken, they must be placed in position as well as possible, cotton wool put between them and behind them so as to preserve the form of the foot, and strips of adhesive plaster so arranged as to firmly retain them *in situ*.

Fractured Tail is often very difficult to treat. When the injury is near the root, a long splint must be fixed along the back, and extend sufficiently over the tail to afford support to a starched bandage enveloping the injured member. When near the point, amputation is the simplest course, but if the beauty of the animal would suffer by this, a starched bandage will prove effectual.

No lotions or liniments should be used to a fractured part, but the bandages and other appliances should be kept dry. Care should be taken to see that no chafing of the skin occurs. If it does, cut away the offending substance as far as necessary.

Bandages should be retained for at least fourteen days, and if they are causing no great discomfort, for three weeks. When a broken leg, especially a front one has weight placed on it too soon and no artificial support, it is apt to become bent. When deformity is no object, or when permanent lameness may be forgiven, fractures in dogs which do not injure any vital organ may be treated with every prospect of saving life. Even when a bone does not reunite, the parts adapt themselves to circumstances. Wounds heal marvellously, and very ugly compound fractures make good recoveries. Hardly any case is hopeless if nature be given a fair chance.

DISLOCATIONS.

Compared with other domestic animals, dogs are rather liable to dislocations, but they are not nearly so often sufferers from this accident as the human subject. The difference is accounted for by the formation of the joints. In those joints in which the formation is such as to limit motion to one direction, or in which strong short ligaments are strengthened by the passage over them of broad tendons, dislocation is rare. In those joints where motion is freely permitted in many directions, dislocation is common. A short explanation of the structure of a joint will show how this results. The simplest moveable joint consists of the junction of two bones, which are held together by ligaments. The ends of bones entering into a joint are smooth, and covered with a thin layer of cartilage, or what is commonly called gristle. Completely surrounding these ends is a thin membrane containing the synovia, or joint-oil, which lubricates the gliding surfaces of the bones. Outside of this thin membrane are strong fibrous bands or ligaments, which hold together the bones and limit motion to certain directions, and in a definite degree. These ligaments are inelastic, and, if the movement of a bone be forcibly carried beyond its normal distance, they become stretched, or even lacerated. In those joints where movement in different directions can be freely effected, such as the hip and wrist, the ligaments are long and comparatively loose; consequently any violent extension of the bones is not only sufficient to stretch them, but is also liable to cause displacement of the joint surfaces, in other words produce dislocation. In those joints where movement is more limited in degree and direction the ligaments are shorter and firmer; therefore, while stretching or sprain is readily induced, dislocation seldom occurs. It may, in short, be said that the greater the freedom of movement possessed by a joint the greater the liability to dislocation; the more limited the movement the greater the liability to sprain, but the less the risk of dislocation. In the joints of the limbs of horses we find a formation limiting motion in a remarkable manner nearly entirely to one direction, and we seldom see dislocation. In the joints of the limbs of man we find a construction giving great facility of motion in various directions, and dislocations are common. The joints of the limbs of dogs take an intermediary position, and we find dislocation only in those joints possessing the greatest freedom of motion.

The cause of dislocation is always external violence, such as kicks and blows, or falls, when the animal's own weight is the force causing the injury. I have never known a case of dislocation in a dog to result from its own muscular action. When dislocation is complete and the two bones forming the joint are quite displaced a further separation is caused by the contraction of the muscles, which pull upward the lowermost bone, thus causing the limb to become shorter, and producing deformity at the point affected. Another characteristic sympton of dislocation is the immobility of the joint, not only by the animal, but by any one examining the limb and attempting to move it. This fixedness does not exist to the same degree in an old-standing dislocation; in fact, in some cases of the dislocation of the hip movement is free enough, but deformity is most apparent, being increased by wasting of the muscles. The existence of fracture, with or without dislocation, is detected by the crepitus or grating which accompanies movements of the limb. Fracture is very often found with dislocation, especially at the elbow. When it exists adaptation of the parts is more difficult, as a simple dislocation when once reduced remains in its place, but when the bone is broken separation of the parts takes place again immediately the extending force is removed.

Treatment.—To reduce a dislocation we have to forcibly extend the limb, so as to bring the head of the displaced bone to a level with the surface of the other bone forming the joint, and to direct it by pressure back into the position from whence it came. In many cases simple extension is sufficient, as when the bone arrives at the requisite level, it is pulled into its place by the muscles attached to it. In others some manipulation is required, and that, of course, differs according to the form of the joint, and the direction in which dislocation has occurred. In dislocation of the higher joints of the limb where large muscles are found, extension is painful and difficult. In these cases the greatest assistance is derived from the administration of chloroform, which in dogs is unfortunately not very safe. A dislocated joint is for a long time liable to a recurrence of the accident.

The Hip Joint is the most common seat of dislocation in dogs. In nearly every case the thigh bone is driven backward and upward, causing a deformity which cannot be mistaken. Extension must be made in the direction of the bone, *i. e.*, downward and forward. In large dogs a bandage may be fixed above the hock to assist in extending the limb; in small ones sufficient grip can be obtained with the hand. In all cases the hip bones must be fixed by an assistant, who keeps the parts steady by firmly holding the dog by the loins, and if necessary the tail. When reduction is effected a firm adhesive plaster should be placed over the seat of injury, and movement limited as much as possible for a week or two.

The Stifle Joint is often the seat of a most troublesome dislocation, especially in young dogs. The large bones forming the joint are not implicated, but a small one which plays in a groove on the upper and front part of the joint. The stifle of dogs and other animals is the analogue of the knee in man, and the knee-cap or patella is the bone I am now referring to. This little bone moves upward and downward in a shallow groove and is held in its place by ligaments on either side. Should it be violently forced inward or outward the ligaments are stretched, and it slips off the groove. The result is the leg is drawn up, the stifle more or less fixed, and the whole limb carried behind its normal position. The displaced bone is easily felt in its altered place on the inside or outside of the joint.

So long as the stifle remains flexed it is impossible to replace the bone, but if the limb be extended by drawing the foot forward and downward it is easily pushed into its place. Unfortunately it is easily displaced, and very often few steps are taken by the dog before the bone is, by the action of the muscles attached to it, again pulled from its groove. An old case of this kind is almost hopeless, but a recent one only requires a firm adhesive plaster to be applied after reduction and movement of the limb to be limited by a splint, to recover rapidly.

The Wrist is seldom completely dislocated. It is a very complex joint, including in its formation about a dozen different bones, a number of which are arranged in two rows placed between the larger bones forming the joint. Occasionally one or more of these small bones become displaced, and are not easily reduced. Slight extension of the foot is made while a movement backward and forward is given with one hand, the other being employed in pressing back to its proper place the prominent bone. The majority of dislocations of the larger bones of the wrist are accompanied by fracture, and are to be treated accordingly, *i. e.*, by reduction and a fixed bandage.

Dislocations of some weeks' standing are nearly always incurable. The joint surfaces of misplaced bones soon undergo alterations of form which prevent their again being adapted to each other. Cavities become filled up and prominent ridges flattened down. The ligaments also adapt themselves to altered circumstances, and when much inflammation occurs exuded material becomes organized and entirely alters the structure of parts.

Dislocations do not kill, although they cause great deformity and lameness. Dogs whose usefulness does not depend chiefly on their soundness of limb may therefore live a long time without pain or inconvenience after the acute symptoms of an unreduced dislocation have passed off.

Immediately a dislocation has occurred is the best time to effect its reduction without chloroform, as then no inflammatory changes have taken place and the shock to the system renders the muscles less active in counteracting extension of the bones. As effective extension is often sufficient to produce replacement of the bones an amateur is justified in attempting reduction in an emergency.—*Wm. Hunting in Land and Water*

WARWICK SHOW.—Pittsburgh, July 11.—*Editor Forest and Stream:* When I read your bright correspondent's article on Warwick show and the mastiffs there, I thought he was going it a trifle too strong. So I sent a copy of the paper to a mastiff fancier, who was in no way interested in any of the dogs exhibited, nor in any of the exhibitors, and asked his opinion as to the correctness of Mr. Portier's judging. His reply was: "He (Mr. P.) evidently knows the correct thing when he sees it." This is from one of the oldest and most critical judges in England. As to Mr. Taunton, I have always heard him spoken of in the very highest terms, as a gentleman above reproach. A well-known breeder in this country had considerable correspondence with him, and says that if it had been possible for Mr. Taunton to take advantage of any one, he gave him the chance, and it was not taken. Mr. Richard Cook, Hon. Secretary of the old English Mastiff Club, a gentleman certainly of spotless character, always writes of Mr. Taunton with the utmost respect. Mr. Wm. Graham of Belfast, who knows doggy men as well as any man in England or Ireland, and who was admirably described as "downy but straight," also spoke of Mr. Taunton as above all suspicion of underhand dealings. I do not remember the exact words "Lillibulero" used and cannot find his article, but I distinctly remember that it was calculated to create the idea that Messrs. Taunton and Portier were colleagues in an underhand way. This may not have been his intention, and if it was not I think he should make an explanation. This is apropos of Mr. Turner's letter in yours of the 9th.—W. WADE.

CHAMPION BUSH.—Providence, July 11, 1884.—*Editor Forest and Stream:* In your paper of July 10, Mr. Frank Kent, of Monticello, New York, advertises beagle pups for sale out of his champion Bush. I being the owner of champion Bush and a litter of six weeks' old pups out of her, think there must be some mistake. Are there two English beagle bitches named champion Bush?—A. H. WAKEFIELD.

PHILADELPHIA DOG SHOW.—The list of special prizes which have been promised by leading firms in Philadelphia is daily increasing in number, and the building in which the exhibition will be held has already been erected. Numerous letters have been received by the Kennel Club inquiring for particulars. These will be sent you in time for your next publication.—HOMO.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Cad L. By Mr. T. M. Steele, Dover, N. H., for blue belton English setter bitch, whelped Feb. 28, 1884, by Cashier (Dash III.—Opal) out of Jersey (Blue Dan—Flake).

Badger Queen. By Mr. John Bolus, Wooster, O., for black, white and tan English setter bitch, whelped Feb. 15, 1884, by Captain Snoozer (Rake—Phyllis) out of Elsie Belton (Laverack Chief—Fame).

Belle Rogers. By Mr. John Bolus, Wooster, O., for black and white English setter bitch, whelped Jan. 14, 1884, by Prince Al (Leicester—Dodge's Rose) out of Moll (Belton—Snow).

Storm. By Mr. E. H. Lathrop, Springfield, Mass., for black, white and tan English setter dog, whelped September, 1882, by Mr. J. Y. Ross's Carl (Leicester—Dart) out of Countess Vesta (Dan—Countess).

Echo. By Mr. Herman F. Schellhass, Brooklyn, N. Y., for black, white and tan beagle bitch, whelped April 15, 1884, by imported Ringwood out of Trinket (Flute—Queen).

Bron. By Mr. E. S. Gaylord, New Haven, Ct., for black cocker spaniel dog, whelped April 29, 1884 (Obo II., A.K.R. 432—Smut, A.K.R. 858).

Belle Gladstone. By Mr. John Bolus, Wooster, O., for blue belton English setter bitch, whelped April 21, 1884, by champion Gladstone out of Jessamine (A.K.R. 1062).

Virginia. By Dr. Geo. A. Quimby and Mr. C. W. Littlejohn, Leesburg, Va., for lemon and white pointer bitch, whelped Oct. 29, 1883 (champion Sensation, A.K.R. 217—Rose, A.K.R. 214).

Clifton. By Mr. Guy Tremelling, Summit, N. J., for liver and white pointer dog, whelped April 18, 1884, by Donald (A.K.R. 1246) out of Grace (A.K.R. 1250).

BRED.

☞ *See instructions at head of this column.*

Glenfinlass—Dick Laverack. Mr. T. G. Davey's (London, Ont.) English setter bitch Glenfinlass (A.K.R. 588) to his champion Dick Laverack (Thunder—Peeress), July 4.

Topsey—Jake. Mr. Geo. E. Browne's (Dedham, Mass.) Gordon setter bitch Topsey (Bailey's Tom—Fanny Rupert) to Mr. Wm. Quiggle's Jake (Tom—Bess), June 1.

Bellona—Sensation. The Westminster Kennel Club's pointer bitch Bellona (A.K.R. 204) to their champion Sensation (A.K.R. 217), July 5.

Blonde—Blue Dick. Mr. John Bolus's (Wooster, O.) English setter bitch Blonde (Carlowitz—Magnet) to his Blue Dick (Blue Dash—Jolly May), July 5.

Daisy—Blue Dick. Mr. John Bolus's (Wooster, O.) English setter bitch Daisy (Belton—Floss) to his Blue Dick (Blue Dash—Jolly May), July 8.

WHELPS.

☞ *See instructions at head of this column.*

Speck. Mr. J. A. Backus's (Newark, N. J.) English setter bitch Speck (Roderick—Foster's Speck), July 7, ten (two dogs), by Blue Blood (Leicester—Doll); one dog living.

Young Swan. The Milwaukee Kennel Club's (Milwaukee, Wis.) imported Irish water spaniel bitch Young Swan (E.K.C.S.B. 12,671), June 15, twelve (four dogs), by Blair's imported Drake (Connaught Ranger—Quail II.).

Dora. Mr. C. M. Munhall's (Cleveland, O.) pointer bitch Dora (Sensation, A.K.R. 217—Devonshire Lass), June 28, eight (two dogs), by his Donald II. (Donald—Devonshire Lass); all liver and white.

Nellie. Mr. J. Crompton's Gordon setter bitch Nellie, June 5, ten (four dogs), by Mr. Geo. E. Browne's Glen II. (Dr. Aten's Glen—Border Lily).

Polly. The Westminster Kennel Club's pointer bitch Polly (A.K.R. 212), June 26, eight (five dogs), by their imported Bang Bang (A.K.R. 394).

Lulu II. Mr. J. J. Scanlan's (Fall River, Mass.) red Irish setter bitch Lulu II. (Berkley—Lulu), July 5, eleven (eight dogs), by champion Glencho.

Delph Viva. The Riverside Kennel's (Clinton, Mass.) mastiff bitch Delph Viva (E.K.C.S.B. 14,738), July 4, eight (six dogs), by The Prince (Crown Prince—Lady).

Rena. The Riverside Kennel's (Clinton, Mass.) mastiff bitch Rena (A.K.R. 262), July 12, eight (five dogs), by their Agrippa (A.K.R. 449).

SALES.

☞ *See instructions at head of this column.*

Dash. Lemon and white pointer dog, whelped Feb. 19, 1882 (Sensation, A.K.R. 217—Lill), by Mr. W. Phillips to Dr. A. McCollom, New York.

Obo II.—Smut whelp. Black, with white on chest, cocker spaniel dog, whelped April 29, 1884, by Mr. H. C. Bronsdon, Boston, Mass., to Dr. Gaylord, New Haven, Conn.

Belle's Pride. Blue belton English setter bitch, 4yrs. old (champion Paris—Harrison's Belle), by Mr. T. G. Davey, London, Ont., to Mr. Hugh Hill, New York.

Canadian Queen. Black, white and tan English setter bitch, 1½yrs. old (Lava Rock, A.K.R. 369—Liddersdale, A.K.R. 592), by Mr. T. G. Davey, London, Ont., to Mr. Geo. C. Sterling, New York.

Storm. Black, white and tan English setter dog, whelped September, 1882 (Carl—Countess Vesta), by Mr. R. B. Nesbitt, Storm Lake, Ia., to Mr. E. H. Lathrop, Springfield, Mass.

Echo. Black, white and tan beagle bitch, whelped April 15, 1884 (imported Ringwood—Trinket), by Mr. N. Elmore, Granby, Conn., to Mr. H. F. Schellhass, Brooklyn, N. Y.

Gladstone—Jessamine whelp. Black, white and tan English setter dog, whelped April 21, 1884, by Mr. John Bolus, Wooster, O., to Dr. S. D. Woods, Connellsville, Pa.

Topsy. Black, white and tan English setter bitch, 2yrs. old (Blue Dick—Burlesque), by Mr. John Bolus, Wooster, O., to Mr. Wm. Fies, Marion, O.

Bonner. Black and white English setter dog, whelped Dec. 24, 1883 (Blue Dick—Bramble), by Mr. John Bolus, Wooster, O., to Col. W. H. Rankin, Paducah, Ky.

Topsey. Gordon setter bitch, whelped August, 1881 (Bailey's Tom—Fanny Rupert), by Mr. E. C. Alden, Dedham, Mass., to Mr. George E. Browne, same place.

Bron. Black cocker spaniel dog, whelped April 29, 1884 (Obo II., A.K.R. 432—Smut, A.K.R. 858), by Mr. H. C. Bronsdor, Boston, Mass., to Mr. E. S. Gaylord, New Haven, Conn.

Bang Bang—Rose whelp. Liver and white pointer dog, whelped May 15, 1884, by the Westminster Kennel Club to Mr. A. Diaz Miranda, Philadelphia, Pa.

Katherine. Red Irish setter bitch (A.K.R. 1085), by Dr. Wm. Jarvis, Claremont, N. H., to Mr. R. R. Howard, Devil's Lake, Dak.

Glencho—Juno whelps. Red Irish setters, whelped April 6, 1884, by Mr. Geo. Langran, Yonkers, N. Y., a dog to Mr. Rudolph Eickemeyer, same place; a bitch to Mr. N. Putnam, same place, and a dog to Mr. Frank Harmon, New York.

Donald—Grace whelps. Liver and white pointers, whelped April 18, 1884, by the Clifton Kennel, Jersey City, N. J., a dog to Mr. G. W. Whaite, Elizabeth, N. J.; a dog to Mr. C. R. Thorburn, Ridgefield, N. J.; a dog to Mr. Guy Tremelling, Summit, N. J., and a bitch to Mr. L. B. Kline, Huntington, Pa.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Donald—Grace whelp. Liver and white pointer dog, whelped April 18, 1884 (Donald, A.K.R. 1246—Grace, A.K.R. 1250), by Mr. G. W. Whaite, Elizabeth, N. J., to Mr. Chas. E. Scott, Bristol, Pa.

A DEFINITE AMOUNT OF INSURANCE, lowest cash rates, plain contract, ample security—such are the special advantages offered by the Travelers, of Hartford, Conn.—*Adv.*

Rifle and Trap Shooting.

RANGE AND GALLERY.

GARDNER, Mass., July 9.—The regular meet of the Gardner Rifle Club occurred to-day. The American decimal target was used; shooting off-hand; distance, 200yds., with a possible 100. The score tells the work of each:

G F Ellsworth	93	W C Loveland	80
G E Fordyce	88	G H Heywood	77
A Matthews	87	H Perkins	62
M Atherton	80		

BOSTON, July 12.—The attendance at the range at Walnut Hill today was very small, most of the gentlemen being away on their vacations. Those that shot had to contend with a strong, puffy wind, which blew from 6 o'clock. In the Victory match, Mr. J. B. Fellow made a good 80. In the rest match, Mr. C. H. Brown made one 97 and one 91. In the decimal match, W. Charles scored two 85's off-hand. Appended are the best records of the day:

Creedmoor Practice Match.

R Reed	4554455554—46	J Darmoddy (mil)	5444454345—42
W J Look	4544455545—45	J C Mallory (mil)	4444154344—40
E C Barnes	5444454554—44		

Creedmoor Prize Match.

F W Perkins	4445545555—46	F Wallace	4545554544—45
R Reed	4454554555—46	W J Look	4444544455—44
T Everett	4455544545—45	J A Cobb	4445454444—42

MONTREAL July 12.—The annual prize meeting of the Quebec Rifle Association has been fixed for the 12th of August at Point St. Charles range. The battalion teams are reduced to six men. In consequence of the rule at Wimbledon the shooting with Martinis has been changed from 800 to 500 and 600yds.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

NEW ENGLAND ASSOCIATION.

Editor Forest and Stream:

At a meeting held in Boston, July 9, steps were taken toward forming a "New England Trap-Shooters Association," and a committee appointed to draft by-laws and shooting rules. I would like to be allowed to offer for their consideration the following suggestions:

First—Would it not be more satisfactory to trap-shooters generally to charge each individual member of the association a certain sum as annual dues, instead of a certain amount for each club, as is the case now in the Massachusetts State Association, and at the time of joining, the person to state what club he identifies himself with, which would do away with all liability of dispute in the case of a person who is a member of several different clubs, as to which club he should shoot with, as has sometimes been the case in the past.

Second—Should the association offer badges for competition, to make all matches open to all members of the association, the winner of the badge to name time and place of the next match. Under the present rules of the Massachusetts State Association, all badges are subject to challenge, and if several parties challenge the holder nearly simultaneously the first challenge received by the secretary of the association is accepted and the others are obliged to wait until after the match takes place before they can challenge again, when the same thing is liable to happen again, thus disappointing many who would like to contest for the badges. Under the proposed conditions I think more interest would be taken in badge matches, a larger attendance secured, the badges more likely to be distributed among different clubs, and more satisfaction given to the shooters generally.

T. S. HALL.

FALL RIVER, Mass.

Editor Forest and Stream:

In conformity with the call extended to the New England sportsmen, a meeting was held at Young's Hotel, Boston, July 9. A large number attended, and the New England Trap Shooters' Association was thoroughly organized. The following comprise the officers elected: President, Dr. C. H. Gerrish, N. H.; Vice-President, E. W. Tinker, Providence, R. I., and L. G. White, Worcester, Mass.; Secre-

tary, C. H. Orr, Boston; Treasurer, A. F. Adams, Boston; Directors, D. Kirkwood, Boston; E. S. Luther, East Providence, R. I.; Col. E. C. Farrington, Portland, Me.; C. M. Stark, Dunbarton, N. H.; Harry Nichols, Bridgeport, Conn. The meeting passed off in the best style, and augurs well for the future of this organization.

BOSTON GUN CLUB TOURNAMENT.

LAST Wednesday found a throng of the strongest shooters in the New England States assembled to run through the programme provided by the Boston Gun Club, and the day being well adapted for clay-pigeon shooting found representatives from Portland, Me., Exeter, N. H., Providence, R. I., Massachusetts also having their best shooters in the lists. In fact, no stronger lot of 50 trap-shooters have yet been brought together. The spacious awning recently added, tended most agreeably to the comfort of the sportsmen, and although the meeting in the afternoon of the New England Trap-Shooting Association narrowed the time limit, some 3,500 birds were disposed of in a summary manner. Below records the success of the different shooters:

First event, 5 birds, 18yds. rise:

H W Eager	01011—3	S B Bartlett	01111—4
W S Perry	01110—3	M Plympton	01000—1
C Plympton	11111—5	G A Sampson	10110—3
W Webber	01101—3	G H McKenney	01001—2
C DeRochmont	10000—1	T B Davis	00011—1
O J Jenkins	10011—3	G Hall	00000—0
C M Stark	11111—5	W L Lavis	11111—5
D Kirkwood	11111—5	E T Smith	11111—5
J A Cole	01111—4	H E Harmon	11110—4

Kirkwood, Davis and Smith first, Harmon, Cole and Bartlett second, Perry and Webber third.

Second event, 8 pair doubles, 15yds. rise:

Eager	10 10 00—2	Sampson	11 11 10—5
Jenkins	00 10 10—2	Smith	00 11 11—4
DeRochmont	10 10 11—4	Kirkwood	00 11 10—3
Perry	10 11 11—5	Stark	11 11 10—5
Webber	11 11 10—5	Bartlett	10 11 11—5
M Plympton	11 11 11—6	Hall	11 11 01—5
Davis	10 11 11—5	McKenney	10 00 11—3

Plympton first, Stark second, and DeRochmont and Smith third.

Third event, 7 birds, 18yds. rise:

Stark	1110111—6	Sheldon, C M	0110111—5
Perry	1111110—6	Payne, J B	1010110—4
Jenkins	1110011—5	Plympton	0111011—5
De Rochmont	0111111—6	Luther	0100101—3
Smith	1111111—7	Sheldon, W H	1111111—7
Bartlett	1000111—4	Webber	1111111—7
Cole	0100000—1	Houghton	0101000—2
Eager	1101111—6	Kirkwood	00110 w—2
Sampson	1111001—5	Harmon	00010 w—1
Davis, W L	0101000—2	Snow	1111110—6
Roberts	1010111—5	Rowell	0111110—5
Tinker	1110111—6	Crandall, G	0100111—4
Davis, T B	0101000—2	Cooper	00100 w—3
Carey	1110101—5	Johnson	0110010—3
Gray	1111111—6	Francis	1110111—6
Payne, C B	1100111—5	Crandall, W	1101111—6

Smith first, Tinker second, Plympton and Rowell third, Crandall, Bartlett and Payne fourth.

Fourth event, 4 pair doubles, 15yds. rise:

Perry	10 00 00 10—2	Jenkins	11 10 00 11—5
Tinker	10 11 11 11—7	Houghton	11 11 10 10—6
Kirkwood	10 10 10 11—5	Francis	10 10 10 11—5
W L Davis	11 10 11 10—6	Smith	10 10 11 11—6
Rowell	11 11 11 11—8	Snow	10 11 11 10—6
DeRochmont	10 10 11 10—5	Webber	11 10 11 11—7
C C Gray	10 11 11 11—7	Stark	11 10 11 11—7
Eager	00 11 11 00—4	Crandall	10 10 11 10—5
Cooper	10 11 11 11—7	Sampson	11 00 11 10—5

Rowell first, Stark and Gray second, Davis third, Sampson and Kirkwood fourth.

Fifth event, 7 birds, 18yds. rise:

Sampson	1111111—7	W Sheldon	1111101—6
Cooper	1101101—5	Payne	1010011—4
Jenkins	1001010—3	J R Payne	1101000—3
Perry	0110001—3	Webber	1001000—2
Eager	1110110—5	M Plympton	1011001—4
Tinker	1100101—4	Barmy	1111110—6
Smith	1110000—3	Harmon	1111100—5
C Plympton	1100101—4	Lorett	1001011—4
Cole	1100111—5	Bartlett	0110011—4
M D Gilman	1001111—5	G F Cutting	0010111—4
Stark	0001111—4	Snow	1100111—5
Carey	0111110—6	Luther	1110111—6
Francis	0110010—3	Rowell	1011111—6
McKenney	1010100—3	Johnson	1101010—4
Houghton	0100011—3	G Crandall	0001101—3
Roberts	0100101—3	H D Mathewson	1101111—6
C M Sheldon	1111101—6	G G Tidsbury	1111011—6
W Davis	1110011—5	L A Adams	0111111—6
Gray	1110111—6	A L Papanti	0111010—4
DeRochmont	0110110—4	J Nichols	0111010—4
Kirkwood	1000110—3	T G Stanton	1110101—5

Sampson first, Tidsbury and Sheldon second, Eager third, Lorett and Plympton fourth.

Sixth event, 5 pair doubles, 15yds. rise:

Kirkwood	10 11 11 00 11— 7	W Crandall	01 10 11 11 10— 7
Roberts	10 01 10 00 01— 5	Gray	11 01 10 01 00— 5
Stark	11 11 01 10 11— 8	Eager	01 11 11 11 11— 9
DeRochmont	00 10 10 10 11— 5	Carey	01 01 11 11 11— 8
Tinker	11 10 00 10 11— 5	Smith	11 01 11 11 10— 8
Perry	01 11 11 11 10— 8	C Payne	10 10 11 11 11— 8
Cooper	11 11 01 11 01— 8	Luther	10 11 10 11 11— 8
Jenkins	11 11 11 11 11—10	Webber	11 11 11 11 01— 9
Sampson	11 00 10 01 11— 6	Tidsbury	10 11 11 11 11— 9
Rowell	11 11 11 10 10— 8	Francis	11 10 11 11 01— 8
Houghton	10 11 11 11 10— 8	Mathewson	11 01 11 00 00— 5
Davis	11 11 11 11 11—10	Johnson	11 10 01 11 01— 4
Gilmore	10 10 11 11 11— 8	Snow	10 10 11 10 10— 6

Davis and Jenkins first, Eager, Webber, and Tidsbury second, Cary third, Kirkwood and Crandall fourth.

Seventh event, 7 birds, 18yds. rise:

Eager	1101011—5	Sampson	1011001—4
Perry	1100111—5	Adams	1101011—5
DeRochmont	1011101—5	Stark	0110110—4
Gilman	1111010 5	C Payne	1101111—6
Smith	1111011—6	C P Plympton	1111111—7
Roberts	1100111—5	J H Brady	1010001—3
W Crandall	0111001—4	Rowell	1111111—7
Stanton	1010011—4	M Plympton	1101111—6
Harmon	0111001—4	Kirkwood	0111110—5

Willard Shooting Association, Portland, Me., Second Team.

Harmon	1000101w.			
Davis	1111101w.			

Rowell and Tidsbury first money and the beautiful gold badge presented by the Boston Gun Club, Bartlett and Francis second, Davis and Webber third, Sheldon and Carey fourth. The two teams from the Willard Club had to withdraw for an early train.

CLAY-PIGEON TOURNAMENT.

THE inter-state clay-pigeon tournament, mentioned in these columns the other day, has been arranged. It will be held at the Metropolitan Baseball Park, this city, Aug. 14-16. The full programme of the meeting is now in preparation, and may be had on application to the Ligowsky Clay-Pigeon Company, 59 Murray street, New York. This is the first of a contemplated series of similar tournaments, concerning which further particulars will be given in our next issue.

Following is the programme:

Thursday, August 14.—Match No. 1, purse $200, individual sweepstake, entrance $5, 7 single clay-pigeons, 18yds. rise. Match No. 2, purse $300, individual sweepstake, entrance $6, 7 single clay-pigeons, use of two barrels, break with second barrel to count ½, rise 21yds., four monies, 40, 30, 20 and 10 per cent. Inter-State team championship contest.—Match No. 3, at 2 P. M., purse $500, open to teams of three from any duly organized gun club (Members of teams must be of at least 30 days standing as club members.) Entrance fee $25, 7 single clay-pigeons, 18yds. rise, 3 doubles, 15yds. rise, no class shooting. A printed list of the clubs entered will be circulated on the grounds.

Friday, August 15.—Match No. 4, purse $250, individual sweepstake, entrance $5, 7 singles, 18yds. rise. Match No. 5, purse $300, open to any team of two, entrance $7, 7 singles, 21yds. rise. New York Harbor team, championship contest.—Match No. 6, 2 P. M., purse $500, open to teams of five from any duly organized gun club (members of teams must be of at least 30 days standing as club members), entrance fee $25, 7 single clay-pigeons, 18yds. rise, 3 doubles, 15yds. rise, class shooting. In this match, No. 6, the club of the team coming from within a radius of 50 miles of New York city, making the highest score of similarly located clubs shall be entitled to the New York Harbor championship medal, donated by the Ligowsky Clay-Pigeon Co. Also the club of the team of N. Y. State making the highest N. Y. State team score shall be entitled to the N. Y. State championship medal, donated by the Ligowsky Clay-Pigeon Co. Also, the club of the team of New Jersey making the highest New Jersey State team score, shall be entitled to the New Jersey State championship medal, donated by the Ligowsky Clay-Pigeon Co. Also the club of the team of Connecticut making the highest Connecticut State team score shall be entitled to the Connecticut State championship medal. (Through courtesy of present holders of said medals at request of the donors; said medals to be subsequently subject to challenge in accordance with the original conditions.

Saturday, Aug. 16—Match No. 7, purse $250, individual sweepstake, 3 pairs doubles, 18yds. rise, entrance $5. Match No. 8, purse $300, individual sweepstake, entrance $5, 7 single clay-pigeons, 24yds. rise. At 2 P. M. the finals of match No. 6, viz., the New York Harbor team championship contest. Match No. 9, purse $200, the Ligowsky walking match, 2 pairs double birds, entrance $5.

Ligowsky rules (June, 1884) to govern unless herein otherwise stated. The angles of the traps shall be fixed (and not changed) similar to the arrangement at the first international clay-pigeon tournament, held at Chicago, May 27-31, 1884.

The traps will be reloaded after each shot. Shooting at sweepstakes, as per programme (supplemented by extra sweepstakes whenever occasion offers, under direction of the officers of the day), will begin daily at 10 A. M. and last until 2 P. M., when the championship matches will commence. Sweepstakes will be "class shooting" unless otherwise stated. Purses will be divided into 50, 30 and 20 per cent., and use of single barrel only, unless otherwise stated. All sweepstakes shall be handicapped. The records of this tournament only to govern the handicaps (see rules). Sweepstakes open to all amateurs. In sweepstakes, ties in double bird shooting shall be shot from traps No. 2 and 4. Ties in single birds shall be shot from trap No. 3, miss and out.

All matches will be from 5 traps (screens), 3yds. apart. Charge of powder unlimited; charge of shot 1¼ozs. Ties for championship matches shall be shot at 5 singles 21yds. rise, and 2 doubles 18yds. rise. The new Ligowsky rules are principally those used at the Chicago tournament.

All entries close with the firing of the first gun in each match. In the championship contest (matches 3 and 6) choice of position will be awarded in the order of entering. Clubs can enter at once, and thus gain this advantage, by remitting $5.

In the championship matches Nos. 3 and 6, each team will finish its singles before shooting doubles; each member of team will remain at the score until he finishes his "singles," etc.

TRENTON, N. J., July 10.—The Trenton Gun Club had a glass ball and clay pigeon shoot at Trenton to-day, 20 glass balls, 18yds., Card rotary trap, and 10 clay-pigeons at 15yds. rise, resulting as follows:

Glass Balls.

MERIDEN.—Connecticut State Clay-Pigeon Shoot, July 9.—Six clubs were represented by four men from each club, 25 pigeons each man. Shooting for the Ligowsky medal, won by the Bridgeport team with a score of 81 out of 100 pigeons, which was the best shooting done this season. Following is the score: Bridgeport 81, Spencer Gun Club (Windsor, Conn.) 78, Parker Gun Club (Meriden) 74, Wallingford Gun Club 75, New Haven Gun Club 71, Parker Gun Club No. 2, 64. For the individual State medal, Folsom and Goodrich tied on 45 out of 50, and in shooting off tie Folsom broke 5 straight and Goodrich 3. The next individual match will be shot in Windsor, July 23.

THE REFEREE'S POSITION.—Wallingford, July 11.—I was referee at a clay-pigeon shoot the 10th. There were about 35 shooters and they had two judges, one judge said broken bird, the other said lost bird, one judge was on one side of the trap and one on the other, and then I spoke up and gave my decision after one had said broken and the other lost. I took it that they disagreed and gave my decision. Everything went all right until I got home and then some of the boys said I had not ought to have said anything until I was asked. I did that way to keep the shoot agoing and have no delay, when one judge said broken and the other said lost. I thought that was disagreement enough and rendered my decision, was I right or wrong? [Wrong.]

When there are two judges, one on one side and one on the other side, so they can see the birds that happen to go that way, the boys said that if one said lost bird the other had no right to say a word because the bird did not come his way. I claim that either judge had a right to speak and it was what they were put there for; was I right or wrong? [Right.]—J. B. B.

UNION GUN CLUB.—Regular monthly shoot on the grounds at Spring Valley, N. Y., July 5; 10 clay-pigeons, 18yds. rise:

J Dunlop	1111011110—8	Geo Dunlop	1111011001—7
J E Christopher	1111111101—9	C B Fisher	1101111111—9
Jas Miller	1011111011—8	W H Eickhoff	1111111101—9
E Eickhoff	1000011111—6	G W Hageman	1001101101—6
J D Wannamaker	1111110101—8	W H Jersey	1011101011—7
H D Grindle	1101111111—9	J Van Blarcom	1011011111—8
J D Van Riper	1011111110—8	F Blackledge	1100011111—7
Bert Moeller	1111011101—8	H D Towner	0101000111—4
Fred Tomkins	1111110101—8		

Ties for the first prize (a gold badge), miss and out, C. B. Fisher won. Second prize (box of shells), J. Dunlop and J. Miller divided.

MONTGOMERY SHOOTING CLUB.—The club celebrated the Fourth by a tournament at Jackson's Lake, Mo., 150 persons being present to take part in the shooting and feasting that followed. A number of the best shots were engaged, including some from the Snowdoun Club, and Mr. G. W. Tunstall of the Mobile Gun Club. Several others were expected from that city and New Orleans, but failed to arrive. Some very fine shots were made. Match at 5 birds, 25yds., plunge traps:

W K Jones	11101—4	T W Oliver	11111—5
W W Tunstall	11000—2	Ed Smith	00111—3
H Barnes	11011—4	A J Taylor	10001—2
B Fitzpatrick	10111—4	H D Long	11111—5
D Ledyard	11011—4	John Crommelin	11111—5
George Marks	11101—4	F C Randolph	01111—4
S T Westcott	11111—5	H Hall	11101—4
Y Rowland	11011—4	W L Hutchings	00111—3
W T Pinkston	11111—5	J E Hall	10111—4
W E McGehee	11001—3	W T Atkins	01011—3
H Crommelin	11111—5		

Ties of 5, 30yds.—Westcott won. Ties of 4, 40yds., miss and out.—Marks and Hole divided on 4 each. Ties of 3, 30yds., miss and out.—Hutchins won third with 3.

Second match, 4 birds, 30yds., class shooting:

Jones	1111—4	Marks	1111—4
Fitzpatrick	0111—3	Rowland	0111—3
Ledyard	1111—4	Randolph	1011—3
Tunstall	1111—4	McGhee	0001—1
Long	1110—3	J Crommelin	0101—2
Ball	1111—4	Davidson	0101—2
Pettus	0000—0	Hall	0101—2
Pinkston	1111—4	H Crommelin	0101—2
Oliver	1111—4	Westcott	1110—3
Smith	1100—2		

Ties of 4, miss and out, 35yds.—Jones won with 5. Ties of 3, miss and out, 35yds.—Randolph won second with 9. Ties of 2, miss and out, 25yds.—Smith won with 3.

Third match, 3 pair double birds, 23yds. rise:

Randolph	00 10 01—2	Marks	11 10 11—5
Ledyard	01 00 11—3	Fitzpatrick	11 11 11—6
Tunstall	11 10 11—5	Rowland	10 10 10—3
Smith	10 11 10—4	Westcott	10 00 10—2
Oliver	10 11 11—5	Jones	11 11 11—6
Long	11 10 00—3	S Crommelin	11 11 11—6

Ties on 6, at 2 pairs: Crommelin 0; Fitzpatrick and Jones divided on 3 each. Ties of 3, at 4 pairs: Tunstall 6, Oliver 5, Marks 7.

Match at 3 pairs, 30yds.:

Marks	1 1 0—2	Oliver	1 1 1—3
Westcott	1 1 0—2	Pinkston	1 0 0—1
Smith	1 0 1—2	Hall	1 1 1—3
Long	1 0 1—2	Jones	0 1 1—2
B Fitzpatrick	1 0 0—1	R Fitzpatrick	1 0 0—1

Oliver and Hall divide first. Ties of 2: Marks 2, Westcott 1, Smith 1, Long 0, Jones 0.

KNOXVILLE, Tenn.—At the regular monthly shoot for the club medal, 15 clay-pigeons, 18yds. rise, trap at fourth notch, the following scores were made:

Jenkins	110111111111111—14
Hebbard, A H	111111101111111—14
Slocum	111111110111011—13
Duncan	111101111110111—13
Kohlhase	001111111111011—12
Ross	001111111111101—12
Nicholson	011111111111101—11
Armstrong	110110110110001— 9
Dedrick	110011111100001— 9
French	001101001110111— 9
Campbell	111010100101100— 8
Hebbard, C C	001110111001101— 8
Woodbury	000111101101100— 8
Eldridge	110101011000010— 7
Groor	001011100011100— 7

Jenkins won the medal. C. C. H.

WORCESTER, Mass., July 8.—The contest for the badge offered by the South End Club was continued to-day at their grounds, Mr. W. L. Davis, who had it, having been challenged by E. T. Whittaker. There were ten strings of five balls each. On the third string Davis broke the lock of the left barrel of his gun, yet he successfully competed with his rival. Messrs. C. B. Holden and E. S. Knowles were the judges, and Mr. Alba Houghton referee. The score is as follows:

Davis	1111111101111111100111101111111111111111110111111—45
Whittaker	1111111111111111111111111111011111111111111111010011100—44

WINCHENDON, Mass., July 9.—At the regular meet of the Winchendon Gun Club, the members tried their hand at clay-pigeons. The result was as follows:

P S Davis	0111111111—9	L F Martin	0000011111—5
Dr J G Henry	1101110010—6	James Sutherland	1001000101—4
F M Brown	1110001001—5	L P Ball	0001011000—3
F F Hapgood	0100011111—6	Chas Cram	0000000000—0

On the Fourth the members had a series of matches. B. F. Loveland, H. E. Curtis and William A. DeLand were the judges. The results of the several matches were as follows:

Pigeons—J. Sutherland first, P. S. Davis second, F. E. Mann third.

Pigeons, open to outsiders—F. W. Loud first, H. E. Washburn second.

Sweepstakes, 5 glass balls—C. S. Lord first, S. Davis second, J. Sutherland third.

Sweepstakes, 5 clay-pigeons—P. S. Davis first, F. F. Hopgood second, J. Sutherland third.

Sweepstakes, 7 clay-pigeons—J. Sutherland first, F. F. Hopgood second, G. A. Taggart third.

Five glass balls and 5 clay-pigeons—J. Sutherland first, F. F. Hopgood second, L. F. Martin third.

SOUTHBRIDGE, Mass., July 8.—The Quinebaug Rod and Gun Club had a field day on the 4th. The attendance and interest was good. The first event was the match between the Quinebaug and the Charlton Gun Club, each has previously won one of the three in the series. The result is as follows:

Quinebaug.		Charlton.	
F B Howe	1010011011—6	H E Brown	1011001011—6
W H Campbell	1101111111—9	J W Cundall	1111011000—6
W Harrington	1100000111—5	F Deon	1011110111—8
C Bradford	1011111010—7	F Pike	1010111100—6
E C Ellis	1111111011—9	J R Warren	1101111110—8
F M Marble	1010101101—6	L E Stewart	0101011101—6
E M Phillips	1011111110—8	W L Bradford	0010000101—3
C W Williams	0101110101—6—56	I Bradford	1110100111—7—50

The remainder of the day was occupied in shooting sweepstakes as follows:

First event, 7 glass balls—Stewart, Todd, Bates, Warren and Pike divided first, Harrington and Campbell divided second, L. W. Bradford and Howe divided third, J. Brantford fourth.

Second event, 7 clay-pigeons—Graham first, Cundall second, Harrington third, Ellis and Stewart divided fourth.

Third event, 5 glass balls—Pike and Stewart divided first, Howe second, Todd and Graham divided third, Brown fourth.

Fourth event, 5 clay-pigeons—Marble first, Harrington second, Williams and Campbell divided third, Cundall fourth.

Fifth event, 6 glass balls—L. W. Bradford and Deon divided first, Bates second, Brown third, Stewart fourth.

Sixth event, 5 clay-pigeons—Harrington and Todd divided first, Stewart second, Harrington third, Cundall fourth.

Seventh event, 5 clay-pigeons—Todd first, SteWart second, Harrington third, Cundall fourth.

Eighth event, two-men team, 5 glass balls each—Graham and Bates, Cundall and L. W. Brandfor divided the first, Campbell and Pocci second, Howe and Ellis, Harrington and Marble divided the third.

MILFORD, Mass., July 8.—The Milford Sportsmen's Club, with guests from Holliston, Franklin, Mendon and Hopkinton, had a field day on Wilkinson ground, where the Milford range is located. The several events resulted as follows:

First sweepstakes, 11 entries, 5 balls—Howe 5, Kinsley 4, Connors 4, G. Whitney 3, Brooks 3, Cook 2, Hancock 2, Carpenter 2, J. Whitney 2, Fletcher 2, Wilkinson 1.

Second sweepstakes, 14 entries, 5 balls—Howe 4, Cook 4, Wales 4, Phipps 3, Wilkinson 3, Brooks 3, Carpenter 2, G. Whitney 2, Manchester 2, Shiner 1, Kinsley 1, Conner 1, Fletcher 1, J. Whitney 1.

Third sweepstakes, 5 clay-pigeons, 12 entries—Howe 4, Wilkinson 4, Kinsley 4, Manchester 4, G. Whitney 3, J. Whitney 2, Conners 2, Phipps 2, Walls 2, Shiner 2, Cook 2, Carpenter 1.

Fourth sweepstakes, 7 clay-pigeons, 14 entries—Cook 3, Phipps 2, Fletcher 2, J. Whitney 2, Shiner 2, Wales 2, Conners 1, Carpenter 1,

G. Whitney 1, Kinsley 1, Brooks 1, Manchester 0, Howe 0, Wilkinson 0.

Fifth sweepstakes, 5 balls, 15 entries—Cook 4, Shiner 4, Manchester 4, Howe 4, Connor 3, Kinsley 3, Wales 3, Phipps 3, J. Whitney 3, Carpenter 2, Wilcox 2, Wilkinson 2, Bass 1, Whitney 1, Bennett 0.

Sixth sweepstakes, 7 balls, 10 entries—Martin 7, Wilkinson 6, Cook 6, Shiner 6, Howe 5, Kinsley 5, Whitney 4, Fletcher 4, Connors 3, Manchester 2.

Seventh sweepstakes, 5 clay-pigeons, 7 entries—Howe 5, Martin 5, Kinsley 3, Whitney 3, Cook 3, Wilkinson 3, Shiner 1.

Eighth sweepstakes, 5 balls, 6 entries—Howe 5, Wilkinson 4, Kinsley 3, Martin 3, Whitney 3, Cook 1.

Ninth sweepstakes, 7 balls, 5 entries—Howe 7, Wilkinson 6, Cook 6, Martin 5, Kinsley 3

Tenth sweepstakes, 5 balls, 6 entries—Howe 5, Cook 4, Linsley 2, Martin 2, Wilkinson 1, Brooks 1.

Shooting for prizes. 14 entries—1st prize, keg of powder, Howe; 2d, bag of shot, G. Whitney; 3d, 5lbs. powder, Connors; 4th, box shells, Wilkinson; poorest shot, box wads, Avery.

WELLINGTON, Mass., July 12.—The Malden Gun Club had its regular shoot at Wellington to-day. Messrs. Sanborn and Pratt attempted to take the gold medal away from Mr. Wemyss, but failed. Mr. Scott had the leather medal in his pocket, but no one appeared to shoot for it, and so he still holds it. The other matches were:

First event, five birds—Lewis first, Shumway and Snow divided second, Morgan third.

Second event, five birds—Snow first, Morrill second, Pratt and Lewis divided third.

Third event, three pairs—Brown, Loring and Shattuck divided first, Adams second, Snow third.

Fourth event, three pairs—Snow first, Hopkins second, Lewis third, Adams fourth.

Fifth event, five birds—Snow and Hopkins divided first, Lewis and Short divided second, Morrill third, Brown and and Morgan divided fourth.

Sixth event, five balls—Snow and Hopkins divided first, Shumway and Pratt divided second, Short third.

Seventh event, five birds—Hopkins and Snow divided first, Adams and Lewis divided second, Brown and Scott divided third, Loring and Shattuck divided fourth.

Eighth event, five birds—Brown first, Scott second, Morrill third.

Ninth event, five birds—Morrill and Hopkins divided first, Snow second, Adams third.

Tenth event, three pairs—Snow first, Shattuck second, Hopkins third.

Eleventh event, five birds—Snow and Lewis divided first, Hopkins second, Short and Morgan divided third.

Twelfth event, five balls, both barrels—Shattuck first, Pratt and Hopkins divided second, Snow third.

Thirteenth event, five birds—Hopkins first, Short and Shattuck divided second, Morgan and Pratt divided third.

Canoeing.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

July 19.—Chicago C. C., First Annual Regatta.
July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 15.—A. C. A. Meet, Grindstone Island.

A CANOE CRUISE ON THE ANCLOTE.

A BEAUTIFUL morning in May, one of Florida's fairest rivers, a little canoe, a double blade, basket of lunch, bottle of coffee, and the old man and the Madam. The canoe swings away from the wharf, the flood tide catches her, and with now and then a dip of the paddle we float lazily up the Anclote.

Nature is at its best this morning. The marsh, lately burned over, has put forth a fresh growth and lays under the shimmering sun like a carpet of green velvet. Fringing the marsh stand the cabbage palmettos, their feathery tops quivering in the morning air; over and beyond is the dark background of stately pines; everything is bright, fresh and joyous. Nature is smiling this morning. The birds are out in force; there is a blackbird piping his liquid notes; beyond swings a cardinal pouring out his song to his mate, and near by sits a mocking bird nearly bursting his throat trying to outsing them both. Over on that dead cedar a snake bird is drying his wings in the sun, his long neck twisting and turning, his bright eye glancing warily around on the lookout for foes or prey. Here and there a fish leaps from the dark water, his sides gleaming in the sunlight like molten silver.

But the scene changes rapidly. The marsh is left behind; the river banks are closing up nigher to each other and getting higher. Trees begin to overhang the water; live oak, water oak, maple, haw, holly, the cypress, and many others mingle their branches along this beautiful river. Wild grapevines hang from nearly every tree. The long gray Spanish moss, the many varieties of air plants, and other parasites of the woods all contribute to make a lovely picture. We float on under the shade of the high trees; it is cool and refreshing, just beyond the reach of the paddle blade. The sun pours down in his full strength.

We glide along without a sound, taking nature unawares. We see many strange and curious things. A huge turtle sunning himself on an old log never dreams of the approach of strangers until we are so near as to almost brush him off, when with most ludicrous haste he makes a scramble, a splash, and he is gone.

Yonder sits a black squirrel; yes, and there is his mate. They see us, but do not appear to be frightened. Ah! there they go, but only one branch higher, where they stop and peer after us as long as we are in sight. Rounding a little point we almost run over a wood duck.

Now we run under a grand old live oak, its trunk nearly covered with parasites its branches draped with festoons of the Spanish moss. As we look up among the wilderness of foliage, we get a glimpse of that quaker of the woods, the swamp pollet, his sober plumage so near the color of the surroundings as to be nearly invisible.

Hark! we hear a sharp little note, and looking closely discover one of the numerous family of flycatchers; the little fellow is intent on breakfast; how he darts from leaf to leaf, peering under each one; how closely he examines every twig and every crevice in the bark, and what a cunning little fellow he is too, scarcely larger than a bumble bee. his back of steel blue, white bars on his wings, and his throat a beautiful yellow.

The banks are quite high now, the stream scarce thirty feet wide, the timber too is different, ash, hickory, bay, and here and there a magnolia; yonder is a beauty, tall and straight, its top a wealth of snow white blossoms, that fill the whole atmosphere with fragrance.

It is about time to lunch, and this is as good a place as any. We let the canoe drift under the thickest shade we can find, secure it with a hanging vine, and pulling out the lunch basket dine like princes. To be sure we have only boiled eggs, bread and butter and coffee, but food isn't all there is to a dinner. The bright sunshine and the cooling shade, the glad songs of the birds, the beautiful scenery, the balmy southern air, loaded with the perfume of magnolia and palmetto blossoms, altogether make a scene which, with the appetite induced by out-door exercise goes far toward a glorious feast.

Dinner over, the pipe lighted, we cast off and on again, our course still up stream. We soon come to a rustic foot-bridge, formed by felling trees across the stream, and twisting vines from branch to branch to make a hand rail; it is a pretty picture.

The stream is narrower still, our progress becomes more and more difficult, until we finally come to a stand still some sixteen miles from our starting point. We land and climb the high bank to find that the beauty is not all on the river.

Tall, graceful pines, each one alone and still all together; how they nod and whisper to each other, the soft summer wind making rare music among the golden green needles in the tops. Then there is the willow oak, with its feathery foliage of indescribable beauty; the black jack, the dwarf palmetto and the evergreen ti-ti, with hundreds of wild flowers. Birds are everywhere; blackbirds, mocking birds, cardinals, thrush, flycatchers, etc. Anon a quail starts out almost from under our feet, and making a terrible bustle is soon out of sight. Yonder is an owl, a little bit of a fellow scarcely the size of a robin, blinking at the sunlight from his hole in the stump of an old black jack.

But the sun is past the meridian, we have sixteen miles to paddle and must be off. Going down stream we paddle for a few yards right in the wake of a huge alligator. He never suspects our proximity until making a short turn he gets sight of the canoe. What a splash! Who would think such an unwieldy brute could move so quick.

As we float noiselessly down the stream we come again to the rustic foot bridge. Strutting back and forth on the logs are two wild turkeys, so intent on love making they never see us until we are within fifty yards. What luck! I, who have so wanted to shoot a wild turkey, have hunted and tramped, waited and watched times without number, and never got a shot at one yet. And here I am within fifty yards of a brace, and I've got no gun. I suppose it's fate and I may as well bow to the inevitable and make up my mind to die without even the pleasure of shooting at one.

Well, they look better alive anyhow. I couldn't eat a whole one if I had it, it's mating time too, and I don't care much for turkeys any way. All at once they catch sight of us, whir-r-r, they are gone, and we go, too. A few more miles and we sight the marsh, the sun is getting down among the trees, we settle down to good solid work, the Eric scents home, soon she rounds up to the little wharf, the crew disembark, and later under the cool veranda we review the day's cruise and vote it a success.

Reader, go thou and do likewise, and may you enjoy it as well as

K. Noo.

CRUISE OF THE PITTSBURGH C. C.

ON the morning of the 23d day of June five members of the Pittsburgh C. C. embarked in their canoes at Mayville, on Lake Chautauqua, in the western part of the State of New York. They had arrived at Mayville the day previous by rail from Pittsburgh, and were now started on their annual club cruise. It had been expected that a much larger number would participate in this cruise, but at the last moment several members were compelled to give it up on account of pressure of business and other engagements.

For two days the club remained on Lake Chautauqua, slowly sailing down the lake toward Jamestown. The winds were regular all the morning, blowing up the lake, and in the afternoon changing and blowing steadily in the opposite direction. As a consequence, the cruisers had abundant opportunity to practice sailing both with and against the wind, something which was much needed by the club, as the home waters are not especially adapted for sailing, the rivers being narrow and the winds at all times uncertain and puffy. Fortunately the trip was made without a capsize, although several narrow escapes were made.

At Jamestown a portage of a mile and a half had to be made around several dams before the cruise could be continued, which portage was made by wagon. Tuesday morning the five cruisers started on the Conewango Creek, which name is said to be a corruption of the sentence, "Canoe won't go," which about expresses the state of the case, for the canoes had to be hauled over shoal waters and lowered over no less than nine dams and dragged across nearly as many booms before the Allegheny River was reached at Warren, Pa. The distance from Jamestown to Warren by road is only twenty miles, but by water it must be nearly seventy. To do justice to the Conewango as a canoeing stream it should be stated that from Frewsburg to Warren is a splendid run, the creek being one succession of swift rapids. If any canoeists contemplate the Chautauqua-Allegheny trip the P. C. C. would advise them to ship their canoes from Jamestown to Frewsburg rather than put them in the water at any point above that place. There are about three dams between Frewsburg and Warren, which can be easily carried over.

At Warren the Pittsburghers were met by the Warren C. C., who treated them most royally, doing everything in their power to make the stay in Warren a pleasant one, in which they were eminently successful.

On Friday morning the cruise was continued, there being five accessions to the party, four of them members of the Warren club and one a member of the P. C. C. who had concluded to come up and join us. The run that day was most enjoyable, there was a good wind down stream so that matters were taken easily, and when the evening camp was made on a beautiful little island the hungry cruisers had journeyed somewhat over thirty miles. Here two of our Warren friends left us, the remaining two concluding to continue the cruise to Pittsburgh.

The trip down the Allegheny has been written up before, so it is not necessary to go into further particulars, sufficient to say that it was a delightful experience to every one. It took twelve days to make the entire journey from Mayville to Pittsburgh, it could be done in a much shorter time, but the P. C. C. were inclined to take things very easily.

In conclusion a word about Lake Chautauqua. It is a magnificent sheet of water, about twenty-five miles in length and varying from two to four miles in breadth. It would be a splendid location for a meet. At Warren one of the W. C. C. proposed that next year an endeavor be made to get the Rochester and Cleveland clubs to join with Warren and Pittsburgh in holding a meet there during May or June. The lake is easily reached by rail from these cities. It is to be hoped that the project may be successful. REBA.

THE A. C. A. RACES.

Editor Forest and Stream:

In replying to the criticisms on the published programme of the American Canoe Association races, I would call your attention to the fact that, in the first place, your announcement was incorrect in several particulars, some of which misprints have not even yet been corrected, the fault for which is certainly not with the committee, and in the second place, the committee worked under certain definite orders from the Executive Committee, given in meeting at Albany last October. These were "to cut down the official races in every way, if possible to have only two days' racing." The programme as arranged, gives the classes, as they now exist, each an official race at the usual distance and at a convenient hour, and in the sailing races, each of the two classes has a race for every usual condition, racing trim, cruising trim and without ballast. In the last race, which has always been for any canoe, the divisions into A and B classes becomes unnecessary, but account is taken of the fact that a good number of boats have now fixed boards of considerable weight, and these are permitted to start for a separate flag, at the same time.

The Executive Committee very wisely, in the writer's opinion, decided to have only such races under their auspices as would do justice to existing classes, but they encourage and hope to see many other races, designed to bring out special points, take place under private or club auspices during the camp. Further, the Regatta Committee have no power to make a special race for the numerous boats which are about 14×30. The present classification does work well, we know, and any regrets which the canoeing editor of FOREST AND STREAM may feel for his own former and superceded classification, should not, in common justice, be put in the mouths of an unknown "large number" of canoeists—the editorial we, perhaps?

"Dot's" suggestion in the last number I consider an admirable one. It is simple, will encourage entries, and give the all-round value of each boat as well as encourage a nice *esprit de corps* among club members and generous rivalry all round. I sincerely hope it may be adopted as a permanent feature.

The Mohican request being already provided for, their resolution was unnecessary. Do they want all the flags?

As to the American Canoe Association badges which Commodore Nickerson writes about, I would like to express an individual opinion against such a scheme. We are not like a lot of boys who must have a secret society pin displayed at all times. Badges of all kinds savor of display, and are, in my opinion, in questionable taste. But this, of course, is only my own feeling. If the majority want something of the kind, I hope the Committee will decide on some plain design without enamel or other mixtures of color, and the smaller the better.

WM. WHITLOCK, Chairman Regatta Committee.

[Mr. Whitlock has certainly misunderstood the tenor of our note in last week's issue, as there was no intention of finding fault with the Regatta Committee, and there was nothing to justify that conclusion. We are aware that they were acting under definite orders and as far as the programme itself is concerned, it is by far the best yet arranged. The faults lie with the present rules, and we simply called the attention of the Regatta Committee to them, as they are the proper persons to remedy them in the future. Our authority for the programme published June 26 was the copy furnished by the Regatta Committee, in which there were two errors, both of which appeared in our report exactly as in the copy. We need not notice the personal allusion of Mr. Whitlock's letter, further than to repeat our assertion that the present rules are unfair to the cruisers, and we are content to leave it to canoeists themselves to say whether we correctly represent their opinion.]

Editor Forest and Stream:

After talking with members of the Toronto C. C. on the subject of Mr. Vaux's proposal about an "average prize" and an "average record," I have a few words to say about it.

The "average prize" idea appears to require some modification. Objection is taken to the plan of counting in every man who starts in a race, no matter if he is nearly last. Would not it be better in making up the average, to count in only half of the total number of the starters? For instance, if nine start, count in only the first five who cross the line. This would insure some merit on the part of those counted in for the average prize. But the last few men in the race may have made a wretched showing, yet they would be counted in; and several quite inefficient sailors or paddlers might start, with no chance for a place, and the result would be merely to push up the average of some man or men who otherwise would be nowhere.

Then it must be borne in mind that the average prize is to a considerable extent a prize for entering a great many races.

The "record" plan appears to be open to the serious objection. There are first class men with sail or paddle who either would not desire to enter more than one or two races, or might be prevented by circumstances from doing so. It would be very unjust to such men that they should be placed in a low position on an official record, which would be extensively read among canoeists. Then, as to the clubs, it would be placing the smaller clubs at a great disadvantage, because, of course, the large clubs would take the cake. If a prize is to be given to the largest club on the ground, put it in that shape, and not under the guise of a record.

Mr. Vaux's plan is one requiring careful consideration and thought before adoption by the A. C. A., especially as to details. Would it not therefore be better for some large club to give it a trial by offering an "average prize?" We should then see how it worked, and if it worked well, the A. C. A. might adopt it for 1885. ISABEL.

[The above letter suggests several objections to the proposed plan which are worthy of consideration. On the first point the result that "Isabel" anticipates is exactly what has long been desired, an inducement for all to enter races. In nearly all races the chances are in favor of one or two of established reputation who are almost sure of first prize, and men will not enter against them; but here we have a strong inducement for every man to enter and work for a place, even though he may feel certain it will be neither first or second, and a man who under such circumstances does enter deserves some recognition. In the second place, it would not be unfair to the "first-class men," as they would in any event take a first prize in each race, while the record would be something additional to work for, and their chances would be the best for a "double first," to borrow an expression. As far as the clubs are interested, their reputation seems to be independent of the size of their membership roll, success depending more on the spirit shown by a few than by the presence of a large number, and a club represented by five or six men of average skill and spirit would have a chance of coming out first on the record. If put in practice this year the scheme will be carried out by a few, entailing no additional labors on the present officers, and certainly can work no harm.]

Editor Forest and Stream:

The Mohicans have read the suggestions made by "Dot," that prizes be offered at the A. C. A. meet for "all round" or averaged merit, and they express general approval of them and will if they are put into practice, give them cordial support. It is conceded that the A. C. A. classification, while it is good and probably the best attainable, does tend, as any classification must, to develop separate types unless recognition is given to the canoe which can do fairly well in many things because it is not specialized for any particular one of them. Some of us have agreed to take notes and construct a record upon the plan recommended of our club races by way of experiment, and see how it results. It is evidently advisable to make one or two trials and observations before making assertions.

So much for our club opinion; doubtless some others will give individual views. For my part, I would advise, first, that the extra trouble of trying the experiment at the Thousand Islands should not be put upon the regular regatta committee, because they have (as has been seen) as much to do as an average committee is capable of; and, second, that the matter should not be allowed to drop, even if it does not secure immediate official sanction. I am very willing to assist if I can, to this end, as follows: I will join Mr. Vaux in keeping the record necessary (and perhaps some other A. C. A. man will be willing to make a trio of this self-constituted committee), and present a report or a petition or a resolution, or any other advisable document, to the A. C. A. meeting and abide by the decision the meeting may arrive at as to the desirability of the scheme. If necessary, we can furnish the prizes, and simply say that such and such canoes have done such and such things, and that it is desirable to recognize the merit reported, and, therefore, Mr. Mr. Vaux moves and we second that the A. C. A. present these as official prizes, and that in future meets the programme shall include similar prizes as the regatta committee may arrange.

I suggest this course because I think that under some circumstances action is better than argument. Just now there is scarcely time to revise the official programme without making confusion, and moreover, this experimental method will do no harm. If it is Mr. Vaux's opinion that these suggestions are not good I will support his scheme in any other desirable way. If we try it, or he tries it, and the experimentalists find, or the A. C. A. finds that it is not good, there is no harm done; but in any case Mr. Vaux deserves credit for an effort for the general good.

I have no doubt that with the improvement and simplification which a little working will put into it, the scheme is a very good one, and I shall be glad if I am allowed by its author to join in the experiment. R. W. GIBSON, Captain M. C. C.

ALBANY, July 11, 1884.

Editor Forest and Stream:

I have read the above letter from Mr. Gibson. The regatta committee, I suppose, will appoint a time keeper for the races. To get the record complete it is only necessary that he should note the time of finish of every boat entering a race instead of the first three, as heretofore. No work need devolve upon the committee. The writing up the record, when all the facts are in, will be a very simple clerical matter. I will gladly do this myself; or, I will accept Mr. Gibson's proposal, and with him and perhaps one other gentleman attend to the whole matter of the record and the average report. The time is so short now before the meet that perhaps we had better wait till we meet at Grindstone Island and then arrange details together and get official sanction for our work, or do it unofficially and report result for future A. C. A. approval. The prizes for the winners is a very minor matter, and if the Mohican Club will furnish first prize, as Mr. Gibson proposes, the N. Y. C. C. will supply a second prize—flag, of course.

In writing my letter last week I had no thought of revising or changing the programme as it now stands, but suggested that the record be kept by the clerk of the course so it could be written up as per plan proposed. I heartily indorse Mr. Gibson's ideas.

To try the experiment in the clubs will require careful arranging of races. I would suggest for a club record that the winner of a race be credited only with as many points as there are canoes entered. It would be fairer for all this way for club work, but not so for the Association races. At least this is how it seems to me. For two years I have been trying to mature such a plan for our own club. Hoping to see it go through in some form, I remain, etc., C. BOWYER VAUX.

THE CAMP FIRE.

CANOE AND CAMP COOKERY.

V.—GAME.

Fried Pigeons.—Dress them, parboil until they are tender, then cut off the legs and wings, slice off the breast pieces, roll in flour or meal and fry in hot pork fat till they are nicely browned. Grouse, ducks, quail, snipe and plover may also be fried, but are better cooked as given below. Snipe, quail and plover need no parboiling.

Fried Squirrels.—Skin and clean, cutting off heads, tails and feet. Parboil and fry same as pigeons.

Roast Quail, Snipe or Plover.—Dress and impale each on a stick with a piece of fat pork in each bird. Set the stick in the ground before a big bed of live coals in a slanting position so that the heat will fall evenly on all portions of the bird, and turn frequently till a sharp sliver will easily pass through the breast. Catch the drippings in a tin cup and pour over the birds again and again, and if they are served on toast pour the drippings also on the toast. The blacksmith's pliers mentioned in a previous paper will come in handy for turning the birds before the fire on their sticks and holding the cup to catch the drippings. Without this tool the cook's hands are likely to be roasted by the time the birds are done.

Roast Ducks and Grouse.—Parboil till tender, then roast as above.

Roast Woodcock.—Pick but do not clean; roast as above without parboiling. Remove the entrails after the bird is done.

Rabbits or Hares require considerable parboiling unless young. They may be fried, like squirrels, cutting them into pieces, or made into stews or soups.

Stewed Rabbit.—After skinning and cleaning the rabbit cut it into pieces, and wash again in cold water. Mince an onion, cleanse and cut into small pieces one half pound of fat salt pork, and put with the cut up rabbit into a pot with about a pint of cold water. Season with pepper and salt, cover the pot and let it simmer till the flesh can be easily pierced with a sharp sliver. Take it up when done and set where it will keep warm, and make a gravy by adding to the water left in the pot one cup of boiling milk or water, stirring in gradually one well beaten egg and one or two tablespoonfuls of flour. Boil one minute and then pour over the rabbit.

Stewed Ducks or Pigeons.—Exactly the same as the above recipe for stewed rabbits.

Roast Venison.—The saddle is the best portion for roasting, and after this the shoulder. Hang it by a cord over a huge bed of coals, with thin slices of salt pork or bacon inserted in gashes cut with a knife where the flesh is thick enough to admit of "gashing," or skewered on with hardwood twigs where it is not. Turn frequently.

Woodchucks and Porcupines do not properly come under the heading of game, but when properly cooked they are little inferior to many kinds of game. They must be thoroughly parboiled before cooking, and may then be roasted or stewed. A young woodchuck or porcupine may be baked in the ground with the hide on after being drawn, and is very palatable. SENECA.

TORONTO C. C.—At a meeting of the Toronto C. C. held on the 3d of July it was decided to give prizes for two races at the A. C. A. meet. First—Two prizes given by the club for a six mile sailing race open to all A. C. A. canoes, no limit as to rig or ballast. Second—Two prizes, given by the commodore, for a sailing race before the wind, not less than a mile, open to all canoes, sneakboxes, or similar craft. No sails to be hoisted until the starting signal is given. By this race the commodore hopes to show the superiority of a sail hoisted by a halliard over lateens, etc. It is quite possible the superiority may not be shown to any great extent, but at any rate it will be an amusing race, and one that ought to have a large number of entries. In running, length is probably the most important factor, and as canoes do not vary much in that measurement all should have a chance. Now don't forget your spinnakers when starting for the meet. The date for these races will probably be the 10th of August, when all likely to participate in races will be present. It was also considered that the A. C. A. should give prizes for meeting gears, canoe tents, sleeping outfits, cooking kits, etc. Such contests would not be open to the objections urged against racing. If the A. C. A. does not move in the matter perhaps clubs might.—BOREAS.

MONTREAL C. C.—The officers of this club, elected July 22, are: President, Forbes Torrance; First Vice-President, Chas. M. Whitelaw; Second Vice-President, D. R. Ross; Treasurer, R. Campbell Nelles; Secretary, E. A. Patterson. The Executive Committee is formed of the gentlemen mentioned above. The club is composed of several divisions, each having a commodore and vice-commodore, as follows: St. Anne's, R. M. Esdaile, Commodore; L. Dowker, Vice-Commodore; Pointe Clair, J. E. Rendell, Commodore; — Campbell, Vice-Commodore; Lachine, W. de Blaquiere, Commodore; A. Kohl, Vice Commodore; Vaudreuil, D. W. Allen, Commodore; ——, Vice-Commodore; Valois, J. Paton, Commodore; J. G. Ross, Vice-Commodore; Dorval, ——, Commodore; ——, Vice-Commodore; Longueuil, A. M'Keand, Commodore; C. S. Shaw, Vice-Commodore. These gentlemen with the executive committee, form the general committee of the club. Delegates will be appointed by the executive committee to attend the A. C. A. meet. A constitution and by-laws, club colors and motto will shortly be decided on. Applications for membership should be made to the Secretary, No. 226 McGill street, Montreal.

NEW YORK C. C.—A sailing race took place on Saturday, July 12, at New Brighton, between the Dot, C. B. Vaux, Freak, C. V. R. Schuyler, and Tramp, C. A. Stevens, over a triangular course of about three miles. The tide was running down, with a fresh breeze up, when the boats got away at 4:30, Freak leading. Tramp dropped out on the first leg, Dot led at first mark, a bark anchored off the cotton docks, and kept her lead on the run to Buoy 17, but coming in Freak passed her, winning at 5:25 P. M. Mr. King, Clyde C. C., was present, and took several photos. After the race the canoeists sailed up the Kills and took supper at Marmalade Lodge, spending the night there. Another race will take place next Saturday at 4 P. M. Mr. Newman is away with Dr. Neidé at the camp, Mr. Burchard is cruising with Mr. Stoddard, and reported at Provincetown on the 11th, Mr. Alden is on his annual cruise down the Richelieu, Messrs. Norton and Van Rensselaer are cruising in the latter's yacht Daisy.

ROYAL C. C.—On Saturday last a race came off at Teddington under novel conditions, which it was thought would prove attractive to many of those members owning cruising canoes of paddleable-sailing type. Only four entries were received, however, and of these only two were of the class for whose benefit the prizes were offered. Paddling and sailing race; sail down wind and paddle back; three times round—Zoedone, Mr. A. B. Ingram; Windrush, Mr. C. Penrose; Mignon, Mr. F. T. Miles; Foam, Mr. H. Church. Windrush did not start. They started paddling down stream, Ingram soon showing to the front, followed by Church. Miles was in a heavy canoe, and failed to keep up with the others. Ingram maintained his lead until sailing up for the last time, when Church got a breeze and closed up considerably. Ingram was similarly favored shortly afterward, and won a good race by over 50yds.—*London Field, June* 28.

OSHKOSH C. C.—*Editor Forest and Stream:* The Oshkosh C. C. held their first race on July 4, around a triangle, 1 mile on each side, for three prizes. The entries, with time, were as follows:

		Start.	Finish.
Alice	Otto Schloub	3 17 00	3 57 00
Sis	F. H. Gray	3 17 00	3 57 30
Reme	Wm. Session	3 17 00	3 58 20
Dollie R.	Wm. A. Radford	3 17 00	Not taken
Aloha	Wm. J. McKay	3 17 00	Not taken
P. D. Q.	Frank Hellard	3 17 00	Not taken
——	Gus Timme	3 17 00	Not taken

Wind light from the west. Judge, D. H. Montgomery. The club will have have a race July 16 for the championship.—F. H. G.

PETERBORO BOATING CLUB.—A parade of canoes by moonlight took place on Little Lake, Peterboro, on July 4, nearly fifty canoes of the P. B. C. taking part. Each canoe carried one or two lady passengers and was decorated with several Chinese lanterns. Tue procession formed in line across the lake at 8 P. M., under command of the president of the club and Col. H. C. Rogers, rear-commodore of the A. C. A., after which they paddled down, performing a number of maneuvers, finally returning to the starting point, after which all the canoes gathered together and songs were sung, the meeting breaking up at 10 P. M. Thursday evening of each week will be set apart for similar squadron drills and parades, in preparation for the A. C. A. meet.

AMATEUR PHOTOGRAPHY.—It is probable that a number of canoeists who will attend the meet next month will take their cameras with them. Would it not be a good time for an exchange of experiences on the subject of amateur photography? If such an expert as Mr. L. W. Seavey, of New York, is present, he would no doubt give a most interesting discourse on the subject, and such amateurs as Messrs. Pullen, Fraser, Taylor and others could give beginners the benefit of their experience. Views of camps, canoes, etc., might be exchanged. Let us hear from all canoe and camera men.—BOREAS.

A. C. A. MEET.—Dr. Neidé is now in camp at Grindstone Island, and his address until Aug. 15 will be "A. C. A. Camp, Clayton, N. Y." We note in another place a moonlight parade of canoes in Peterboro. Why would not a similar display be possible at the meet? In view of such an event each canoeist should provide a few Chinese lanterns and candles as a part of his equipment.

AMSTERDAM C. C.—This club enjoyed a run down the Hudson on the night of July 3, camping out and spending the following day sailing, there being a fine breeze all day.

Yachting.

FIXTURES.

Secretaries of yacht clubs will please send early notice of proposed matches and meetings.

July 19.—Hull Y. C., Ladies' Day.
July 24.—Eastern Y. C., Annual Cruise.
July 26.—Beverly Y. C., Nahant, Second Championship Match.
July 30.—Lake Y. R. A., First Matches, Oswego, N. Y.
July 30.—Oswego Y. C., Annual Matches.
July 30.—Quincy Y. C., Third Match.
Aug. 2.—Hull Y. C., First Championship.
Aug. 4.—Quaker City Y. C., Review and Harbor Cruise.
Aug. 9.—Boston Y. C., Annual Matches.
Aug. 11-25.—Quaker City Y. C., Annual Cruise in Chesapeake and Delaware Bays.
Aug. 16.—Salem Bay Y. C., Open Matches.
Aug. 16.—Hull Y. C., Open Matches.
Aug. 23.—Boston Y. C., Third Club Match.
Aug. 23.—Beverly Y. C., Open Match.
Aug. 26.—Beverly Y. C., Special, Marblehead.
Aug. 28.—Quincy Y. C., Fourth Match.
Aug. 30.—Hull Y. C., Second Championship Match.
Sept. 3.—Hull Y. C., Third Championship Match.
Sept. 4.—Salem Bay Y. C., Second Championship Match.
Sept. 6.—Beverly Y. C., Marblehead, Special Match.
Sept. 6.—Hull Y. C., Third Championship Match.
Sept. 11.—Quincy Y. C., Last Race.
Sept. 11.—Brenton's Reef Challenge Cup.
Sept. 13.—Boston Y. C., Ladies' Day.
Sept. 13.—Boston Y. C., Fall Matches.
Sept. 14.—Quaker City Y. C., Review and Cup Race.
Sept. 28.—Quaker City Y. C., Review and Harbor Cruise.
Oct. 5.—Quaker City Y. C., Closing Review and Cruise.

THE BIG JIB MUST GO.—The fact is some yachtsmen, or those in charge of yachts, have been working so long in one rut there is no possibility of their leaving it. With many yachtsmen racing simply means hoisting sails, and then if the wind blows hard enough so that the big jib cannot be carried, why—they go home. This has been the time-honored custom, but it cannot be so much longer. The yachtsman who has the enterprise to rig his boat with chain halliards, so as to be ready for all kinds of weather, will be the yachtsman who will win cups when the water is rough.—*N. Y. Herald, July* 12.

FROM PORT MORRIS TO LAKE GEORGE.

A FRIEND of mine, being anxious to take a sailboat to Lake George, we determined to sail it up ourselves. The trip presented many amusing incidents, which I now will endeavor to jot down.

We started from Port Morris, near Harlem, three of us, in the Breeze, which we had converted from a sloop into a catboat. She is about 25ft. long, 10ft. beam, stiff as a house, and quite fast. It was Sunday morning, which day we had chosen because fewer ferry and other boats run on that day. We passed Hell Gate in fine style, a strong wind blowing at the time; down the East River we proceeded, the wind beginning to die out. There was so little little left when we reached the bridge that we merely drifted under it, and kept on drifting, too, until, to all intents and purposes, we seemed bent on a trip to Europe.

By and by a little breeze sprang up, and we were enabled to go up the North River and managed to reach Yonkers that evening. Here we anchored for the night and took our last meals on shore for quite a while.

Next morning before we sailed away, the little oil stove was put into requisition, hot coffee, bread, corned beef, hot corn, sweet peas, and a can of peaches furnished that morning's entertainment, which the cook for the day, an honor evenly divided between us, called "just a light breakfast," which we innocently took as such. As we had a heavier lunch and a still more weighty dinner, followed by a mild supper, I shall not refer to food again, therefore, let at once the alarmed reader know that starvation was no part and parcel of the programme.

The next day's sail was very pleasant up the broad Hudson, with its beautiful lofty banks, here and there dotted with pretty, cool summer residences. Reaching the Tappan Zee, a good wind blew over the broad expanse of water, and pleasant indeed was the sailing then, after the hot days in New York. That evening we reached Haverstraw, and anchored near some brick works in a very pretty little bay. Next day we started somewhat late, and with little wind and a great deal of drifting, we reached West Point, where we stopped all night near the railway track, and the thundering of trains and the big swells from the night steamers kept the others awake, but not the writer, who sleepeth the sleep of the just at all times, and hath even, but calumniously, been accused of snoring, albeit the flood gates of heaven and the peals of thunder have poured forth the vials of their wrath on the thin and only blanket which hath at such time been his sole covering under such aforesaid heaven.

The next day was uneventful, we only reached Poughkeepsie, and anchored near there; saw none of the maidens that dwell within the caves of Vassar, but we allowed ourselves to dream of them at leisure—lots of leisure. Next morning we mildly drifted up with the tide for one or two miles, when just before noon the wind began to blow great guns, and we, before dark, covered the fifty-odd miles up to Catskill, making a splendid run. The wind right behind and blowing so as to make us feel glad the Breeze had a good solid mast. Next morning the wind kept up and we finished the distance up to Albany in about five hours—some thirty and a few miles.

Here we had our mast unshipped and were compelled to say good bye to one of our party who was obliged to return to New York, so that my friend, the owner of the Breeze, and myself, with Jim, an Irish setter, were left to go on with the journey.

From here we were towed up to Troy, and thence to West Troy, where we arrived in the afternoon; we then went to Waterford, where the Northern Canal to Whitehall begins.

Here we happily fell in with an exceedingly intoxicated but withall friendly gentleman, who many times consigned himself, his eyes and his soul to everlasting perdition in endeavoring better to prove his high regard for his friends, and who gave us much information as to canals in general and his own disinterestedness in particular. The result was that we got a clearance that evening and engaged a native to tow us to Whitehall.

We lay ourselves down to sleep in the boat near the canal, after carelessly exhibiting several firearms, and assuring the trusting aborigines that Jim the setter has been found guilty of manslaughter on several occasions. Poor Jim! Thou oft calumniated canine, I must doubt whether thou ever hast tried to bite aught but a flea, and even then hast thou probably not succeeded.

Next morning, after passing through locks innumerable until our heads felt dizzy, two unfortunate Columbuses might have been perceived seeking new worlds to conquer in a canal, meandering through the complicated curves of said canal.

Our painter was lashed onto the back of the craziest buggy I have ever seen, in fact quite a new thing in the way of buggies, resembling a daddy longlegs after a stampede. The driver was peacefully nodding away the stilly hours, seated with great daring on that very buggy, and drawn by a quadruped whose back might have shed the rain beautifully on account of its sloping Gothic shape, and whose head in profile resembled that of a goat, and in full face that of a bald eagle.

On this canal new things were revealed unto me, the fact is, I really had never heard any swearing before. Many times in the gorgeous Maine woods had I heard a guide deliver an oration so interlarded with profanity that the cold shivers ran down my back. On many other occasions, as a wanderer over the face of the earth, had I heard a thing or two in that line; but notwithstanding all this, I was really innocent as a child unborn to blasphemous literature until I came across these sturdy champions. I have recently read of a man who described a certain variety of pie, manufactured by his fond maternal parent, as being almost religion; this was not religion, but it decidedly belonged to the book of revelations. We often could see a set of canal mules trudging toward us a quarter of a mile away, the sweet strains of blood-thirsty endearments would reach our ears, louder and louder would they grow, the canal boat would pass us, our driver and their driver would cheerfully salute each other with sundry absolutely ferocious insults; our hair stood on end. With an extra kick at and from the mules they passed on, and the sweet music would last until they were lost in the distance.

Two days were thus whiled away, and one afternoon we reached Whitehall. We had been informed that we could that day take the Canada tow, which conveys many large canal boats to Canada, and was to start at 4 o'clock. We arrived at the locks and managed to get through them at about five minutes past four, in excellent time to see the tow puffing away in the distance. We tried to row the big catboat up and reach the tow, and our efforts were proving unavailing, when two kind gentlemen who were enjoying a row offered us a help, and taking our painter they pulled us up manfully, and we succeeded in reaching the tow. We hitched on to one of the boats and enjoyed a good rest.

The boatman informed us that we would reach Ticonderoga at or about one in the morning, a cheerful prospect, and then asked if we had any whiskey on board. We had to acknowledge the soft impeachment and pull out about half a quart that was left of a solitary bottle (upon my word) which we had laid in in New York, for possible medical use. Then our men on the canal boat, and I have carefully since computed that their stomachs can stand a pressure of about seventeen atmospheres, for in a few seconds the bottle was empty and the whole gone, not to join the angels.

One of the men assured us that he would let us know when we reached Ticonderoga; he said we could not mistake it anyhow, and described it lucidly, saying that there was a point and then a bay, and old ruins on top of the point; that was very clear, of course, as points and bays were as thick as peas, and the darkness of Egypt prevailed. We suddenly, at about 1 o'clock, thought that we must be about there. We could see a bay and a point, of course, as we could have done anywhere, our friends were all asleep, so trusting to luck we cast off our line; my friend had seen Ticonderoga in the day time a few years before, and thought this might be it.

We pulled the boat toward shore and anchored for the night, after having had our blood half curdled in our veins by a set of the most demoniacal yells I have ever heard, but which probably really consisted of the dilettante efforts of some amateur bullfrog.

At dawn of light next morning, we found that we really were right near Ticonderoga, so we pulled the boat a few hundred yards up the river, and majestically anchored in two feet of water on a tenacious mud bottom.

That day we could proceed no further, but we made arrangements with a teamster to take us into Lake George, for the boat had to be taken out of the water, placed on a wagon and taken to the lake, a distance of about a mile and a half. We arranged to have everything done the next morning, and for the first time since we left New York we went and partook of most excellent hotel fare. During the night it poured hard, and we took refuge in the hotel. We had arranged to be at work next morning at 7 o'clock, but seeing that it was pouring hard at about half-past 6, we turned on our pillows and slumbered on, persuaded that no one was anxious to get drowned.

The first thing we knew our teamster friend made a violent irruption into my room, a cloud of vapor arising from his garments, and with the peculiar husky voice which so generally results from much water "extra" and much whisky "intra," informed me that he'd be considerably perditionized if he was going to wait any longer. I put on my rubber coat, rubber bip boots and rubber hat, my friend did about the same, and we sallied forth. When we reached the river we found a large wagon, on which two large timbers had been bolted to hold the keel. The wagon was backed into the river by our man, who was at that time at the happy stage of intoxication, and who was backing his horses into the river in an aimless way, with great danger of drowning himself and his horses. At last it was far enough out, and the boat was floated onto and made fast to the wagon. Then, with perfect happiness, we found out that neither two nor four horses could draw it out, the wheels being a foot deep in the mud. At last we managed to procure a set of blocks, and making everything fast, with a team of horses on the fall we got her out.

The teamster meanwhile had mostly looked on, sworn at the bystanders, and taken frequent swigs at a pint bottle of fluid lightning, and had become half maudlin and half uproarious, as he wanted to boss the whole busines, and did everything wrong. This was a big nuisance, and we planned several ways of getting rid of him. I proposed knocking him over several times, and then laying him in the boat, but we thought the remedy was slightly harsh. Then we thought of giving him more lightning, but we remembered again that Ticonderoga was but a small town and probably did not contain enough of it to soak thoroughly such a sponge. Finally we managed to get on, as he became affectionate and only wanted to kiss us. We promised we would let him if he behaved, and finally reached Lake George, where the wagon was again backed in the water, and the Breeze afloat once more.

Next day the mast was shipped, the sail bent, and ballast put in, as we had removed what we had in before taking the boat across. In the afternoon we sailed, but as the wind died out we only reached Rogers Rock, and we stopped all night at the hotel there.

Next morning we sailed off once more, but the wind blew so hard that we had to take in a reef, for the first time during the voyage. The wind being dead against us we had to tack about a great deal, and, though going very fast, we did not get on very rapidly toward our destination. During the afternoon we were struck by two or three very violent squalls, in which the Breeze behaved nobly.

Toward evening the wind died out and we were doing nothing for quite a while. Toward our left on shore we could preceive the Horicon Pavilion, and we tried to reach that. I got out in the skiff, tied the Breeze's painter to the seat of the skiff, as I had no ring behind, and began tugging toward there. It had become pitch dark then, but we could see a faint light toward the pavilion. The water was smooth and glassy, the sky cloudy and dark.

Suddenly, like a lightning flash, the water became one white sheet about a quarter mile north of us, and in one moment the squall struck our sail that had been flapping idly before. Fortunately our main sheet was loose, but the shock was so sudden that the bow swung round, dragging my skiff and myself sideways. I shipped almost half the skiff full of water, but managed to save myself from upsetting and reached the Breeze. I made the skiff fast and rushed forward. My friend had already let down the peak, and I let down the throat, and we got the sail down on deck, for we could not think of sailing in such a squall, in absolute darkness, among hundreds of rocky islands. We drifted slightly toward shore, where we could still see the light burning, and made ready soon to cast the anchor, when suddenly the light went out, leaving us in the darkness of Egypt. We guessed at how near we were to shore, and shortly after cast our anchor. About sixty feet of chain rolled out and it stopped; we let out about thirty feet more and waited anxiously. It was holding.

The wind was whistling furiously through the rigging, huge waves were tossing us about, but worst of all was the darkness. At 11:30 we began dragging, let out more chain, dragging still, all we had, dragging again; we suddenly stopped a moment, a big wave lifted us up, we felt a shock and the big anchor and a hundred feet of chain were gone. Now we began drifting; it was about 1 o'clock; we made a drag with our pail, but it did not help us much. In that way we drifted, how long I hardly know, through a maze of islands which made me shiver next morning when looking at them. We suddenly were stopped, in the dark, and we knew we had stranded somewhere. Regardless of the boat or anything else, we hopped into the water, nearly to our waists, and made for shore, a few yards distant, where we froze all night on a luxurious granite couch.

When morning came we saw we were in the only place where the Breeze could have stranded for miles without hurting herself, and, curiously enough, hardly two hundred yards from the Hundred Island House, which was our destination. The Breeze was safe and so were we. Thus ended a pleasant trip, and thus ends, I am afraid, a long and perhaps tedious narrative. G. V. S.

"KITES AGAINST SAILS."

THE following account, as promised in my last letter to FOREST AND STREAM, of one of the races in which a kite-drawn boat was engaged, is copied from an English magazine of 1880:

"It was on a fine August morning, forty years ago, when we made our way to Rownham Ferry to try what we could do with the Laura against the Gipsy yacht, whose owner, proud in her achievements, had laughed to scorn our willingness to match our kite-sailed boat against her from Rownham to Old Passage and back.

"Our party was a numerous one, mustering upward of a dozen, and very merry were we, but anxious witnal, as the Gipsy was well-known for her fast sailing qualities, and the wind was of just that nature that best suited our opponents.

"The kites and apparatus we had sent on before, and when we arrived at the Ferry we found the Laura all ready for us and the Gipsy just getting out into the stream. After a little delay we started about 10 o'clock, but in the meantime the wind had dropped and shifted so that our expectations were somewhat more cheerful than they had been as we journeyed to the river. It did not take long to get off, the pilot kite ran up in rare style, and the main followed without trouble, and was soon brought into work. Away we went, but not so the Gipsy, for the wind had fallen so that she scarcely moved, and after we had gone as far as the Hotwells it became obvious that if there was to be any race at all it must begin lower down, and so we threw the main kite on the wind and stood by to allow the yacht to slowly overtake us. When she did so her owner confessed that we had the better of him in the narrow gorge, as his sails could get no wind, and ours, right away above the crest of the downs, were as full as we wished, but he was convinced we should have no chance further on, and so we sailed for Pill, and waited till the Gipsy, by sailing and tugging and the aid of the stream, floated down to us. At Pill the race really began, and the yacht had decidedly the best of the start. The breeze had freshened, and away both boats bowled past Broad Pill and the Gibbet Pole into the Channel.

"It soon became obvious that we could do as we liked with the Gipsy, who only led for a few hundred yards at the beginning, and as we got off Cluttering Wharf, we were leading so far that we ran across the bows of the yacht, and allowed her to pass to port of us. No sooner had she gone by than we crossed back into our course and came up to her hand over hand. In vain she maneuvered, in vain her captain endeavored to shake us off. We slipped past her as if she were standing still, and off Aust Cliff, which was the end of our outward journey, we were half a mile ahead.

"We turned and waited till the yacht came up, and when she went about we followed her, and commenced her return. But if the kites had beaten the sails easily on the journey up the Channel they fairly made an exhibition of them on the run home, for the wind had backed and we could sail much nearer it than the Gipsy could, so after a good deal of 'chaffing' and sailing around her once again, we bid her crew good-bye, and giving an extra pull at our braces to bring the kites into full action, literally jumped off from her, and sped away to Rownham to order the dinner at the expense of her owner, which, by the terms of the match, the loser had to stand.

"I will sometime or other copy out from the same magazine a description of the kites used on this and similar boats, and perhaps some small yacht may put one on at the bow and go "kiting" to victory "Hollis." ELLIOT.

HULL Y. C. ANNUAL MATCHES.

THIS club held their forty-second matches on Saturday, July 12, over their course off the club house at Hull. The race was open to yachts of the club only, which were classified as follows: first class, sloops and cutters of over 30ft., $25; second class, sloops, 25ft. and under 30ft., prizes, $20 and $15; third class, sloops, 21ft. and under 25ft., prizes, $15 and $10; fourth class, cats, 20ft. and under 25ft., prizes, $15, $10, $5; fifth class, cats, 18ft. and under 20ft., prizes, $15, $10, $5; sixth class, cats, under 18ft., prizes, $10, $5.

Each yacht was allowed one man per 4ft. of length. In third class, sloops were allowed only mainsail, jib and gafftopsail, catboats being allowed but one sail.

The course for first and second classes was: From judges' line to Black Brush buoy, No. 1, half a mile south, leaving it on starboard, to yellow barrel marked H.Y.C., off Pettick's Island, leaving it on the starboard, through Hull Gut to buoy on Winslow's Rock off Rainsford Island, leaving it on starboard; thence leaving Hunt's Ledge and Point Allerton buoys on starboard to bell boat on Harding Ledge, leaving same to port; returning, leaving Point Allerton and Hunt's Ledge buoys on port, to judges' boat, passing between it and flagboat; distance eleven miles. Course for third class—From judges' line to West Gut, leaving Pettick's Island on starboard; thence northeast by north three-quarters of a mile to black buoy on Wilson's Rock, leaving it on starboard; thence to striped buoy on Hunt's Ledge, leaving it on the starboard, through Hull Gut, to the judges' boat, passing between it and the red flag—seven nautical miles. Course for fourth, fifth and sixth classes—From judges' line to steamboat barrel off Seal Rocks, leaving it on starboard, to buoy off Prince's Head, leaving it on port, to No. 1 Brush buoy (½ mile south of starting point), leaving it to starboard, to yellow barrel buoy marked H.Y.C., off Strawberry Hill, leaving it on port, to steamboat barrel off Seal Rocks, leaving it on port, to buoy on Prince's Head, leaving it on starboard, to barrel buoy off Pettick's, leaving it on starboard, to judges' boat, passing between it and flagboat.

The Regatta Committee were Messrs. M. J. Kiley, chairman; J. A.

Osgood, W. H. Miller, H. N. Curtis, F. M. Griffin, E. A. Dow, and P. M. Bond secretary. The judges, Messrs. H. E. Crowell, F. C. Brower and Col. Harrington, were on board the sloop Bertha.

The wind was light from southwest, freshening later on. At 3:15 P. M., the first gun was fired, the second following at 3:20, Nimbus crossing the line alone in her class. A third gun fired at 3:25 sent off Banneret, Em'ly, Transit, and Altaire, and at 3:30 came Sea Bird, followed by Davy Crockett and Alda. The large cats went over at 3:35, Queen Mab ahead, Joker, Niobe, Amy and Thisbe after her, then at 3:40 came Hornet, Viva, Kismet, Myrtle, Sheerwater, Spray, Spider and Imogene, while the smaller ones came last at 3:45, Charlotte G., Mirage, Samaria, Zip and Idlewild. Thilga, somehow or other managed to start in second class, although belonging in third. Thisbe was unfortunate enough to carry away the jaws of her gaff, so returned. About 5 P. M. the boats began to come in, and made lively work for the judges in taking their time correctly.

The following table gives the result of the race:

Name, Rig and Owner.	Length.	Actual.	Corrected
Nimbus, c. b., B. Jenney, Jr.	34.05	1 49 54	1 23 41
SECOND CLASS.			
Transit, k., E. H. Ingalls	27.03	1 55 23	1 22 39
Banneret, k, J. Brown	25.01	2 01 35	1 26 25
Em'ly, k., C. A. McManus	27.00	2 03 49	1 30 49
Altaire, k., J. H. Sherburne	28.09½	2 09 55	1 38 45
THIRD CLASS.			
Sea Bird, c. b., G. S. Furbush	24.01	1 19 51	55 51
Davy Crockett, c. b., H. Putnam	21.06	1 25 12	59 46
Alda, c. b., W. H. Wilkinson, 2d	24.01	1 27 50	1 04 39
FOURTH CLASS.			
Queen Mab, c. b., Burnell & Litchfield	22.06	1 23 35	59 04
Amy, c. b., E. W. Baxter	21.05	1 25 33	1 00 03
Niobe, c. b., F. L. Dunne	20 06	1 27 19	1 00 56
Joker, c. b., George Coffin	20.08	1 28 48	1 08 26
Thisbe, c. b., S. A. Freeman	21.05	No time taken.	
FIFTH CLASS.			
Hornet, c. b., H. L. Harding and A. B. Merrill	19.03	1 36 13	1 08 31
Viva, c. b., Hutchings & Prior	19.06	1 30 56	1 03 31
Kismet, c. b., H. N. Curtis	18.11	1 35 12	1 07 09
Sheerwater, c. b., W. M. Merrill	18.09	1 33 02	1 04 48
Imogene, c. b., B. T. Wendell	18.10	1 34 16	1 06 07
Myrtle, c. b., C. H. & R. C. Poor	19.06	1 35 22	1 07 57
Spider, c. b., Jere Abbott	18.11	1 33 26	1 05 23
Spray, c. b., H. H. Faxon	18.10	1 33 10	1 05 01
SIXTH CLASS.			
Mirage, c. b., L. M. Clark	17 10	1 33 00	1 03 42
Samaria, c. b., S. G. King	17.09	1 35 59	1 06 35
Charlotte G., c. b., S. A. Freeman	17.11	1 39 31	1 10 18
Zip, c. b., G. W. Morton	16.09	1 46 05	1 15 25
Idlewild, c. b., Henry Taggart	17.08	1 50 40	1 20 38

Next Saturday will be ladies' day, and the club will join in a sail.

A RACE BETWEEN TRADING SCHOONERS.

THE schooners Hines and Judy, which were racing from Baltimore to Morehead City, reached that point yesterday morning, the Judy being ten minutes ahead. This is, perhaps, one of the closest ocean races on record, and excited much comment in the city yesterday. But there seems to be some doubt about surrendering the purse of $350. Mr. Thomas B. Schall, owner of the Hines, claims that the arrangement was that each boat was to go round the sea buoy off Morehead City, and that his vessel did this, while the Judy ran round the inner buoy and thus got in ahead. In fact, he claims that the goal was the sea buoy referred to, and that the race ended there. He therefore refuses to surrender the money. Mr. Schall bases his action upon the following telegrams:

"MOREHEAD CITY, N. C., July 11, 1884.—We made the sea buoy and went round. They made inner buoy and claim race. Do not give up money. Will write particulars. C. F. TERRY."

"MOREHEAD CITY, N. C., July 11, 1884.—Your referee left it to crew. They admit they never made sea buoy. Could not have made it first, as they were off the course. C. F. TERRY."

Terry is the commander of the Hines.

"MOREHEAD CITY, N. C., July 11, 1884.—Give no money up. Will be some trouble. Things going crooked. T. B. SCHALL, JR."

"MOREHEAD CITY, N. C., July 11, 1884.—Arrived this morning. Judy passed buoy ten minutes ahead. W. T. SMART."

Smart is Mr. Schall's referee. He stated yesterday that he had telegraphed Mr. Smart to the effect that the race was to the sea buoy above referred to, and he must make his decision accordingly. Mr. Schall claims that he has witnesses to prove this. Mr. M. Garrett, owner of the Judy, claims that the race was finished in accordance with the terms of agreement, and has the following telegram from his referee to show for it:

"MOREHEAD CITY, N. C., July 11, 1884.—Arrived this morning. Judy passed buoy ten minutes ahead. W. W. MARSH."

Capt. J. R. Billups, commander of the steamer Havana, in speaking to a *Sun* reporter of the race, said it reminded him of the old days of the Baltimore clippers. From 1855 to 1858 he was in the service of Mr. Pendergast, running a clipper schooner between this port and Charleston, S. C., and the West Indies. There were many vessels of this class engaged in the trade, and the competition between them was lively. Two would leave here together and race all the way to their distant port. At night each would hoist a lantern to the topmast-head to let the other know where she was. Frequently when one vessel had clewed up her sails in Charleston harbor the other clipper would put her jibboom over her stern and tie up to the dock. Sometimes a number of them would leave Charleston together and race all the way up the coast. If it happened that they reached Sandy Point at night they anchored there and waited for morning. In those days vessels would not come through Bodkin Swash at night, but rode at ancher until morning. Many a time the crews would sit up all night and wait for the first streak of dawn, so as to take advantage of the earliest moment of starting. It was not at all unusual for them to enter Union Dock several together, or at intervals of a few minutes.—*Baltimore Sun, July* 12.

HULL Y. C. CRUISE.

THE second day of the club cruise opened on the fleet in Marblehead Harbor, bright and pleasant on the morning of the 6th instance, and the signal was hoisted on the flagship Brenda to get under way promptly at 8 o'clock A. M. All of the yachts that were to accompany her made sail, and the schooners Brenda, Captain Abbott, flying the pennant of Commodore Perkins; Vif, Vice-Commodore Crane; yawl White Cap, Rear Commodore Rice; schooners Alice, Captain Lockhart, and Tempest, Captain Whittier, and sloops Nimbus, Captain Jenney, and Gem, Captain Osgood, and cutters Sigdriffa, Captain Monks, and Ella May, Fleet Captain Tyler, stood out of the harbor to eastward before a gentle southwest breeze. The Tempest laid to off Lowell Island to take aboard additional guests, and so was delayed for some minutes.

Running out through Salem Bay past Baker Island lights, the fleet plunged into a heavy southeast swell and bore up for Cape Ann. Off Gloucester the Brenda signalled for all to make for Portsmouth Harbor, and the fleet passed Thatcher's Island with the White Cap in the lead, closely followed by the Alice, Brenda, Nimbus, Gem, Ella May, Sigdriffa, Vif and Tempest in the order named. Hauling up under the cape in smooth water, the Alice rapidly forged ahead, and heavy puffs of wind came off Gloucester Head, one of which carried away the topmast of the Gem, forcing her to turn back, and parted the sister hooks of the topmast shroud on the White Cap, as she was carrying gafftopsail, while the other schooners had topsails clewed up.

As the fleet cleared the land the wind gradually moderated into a steady southwest breeze, and the run across Ipswich Bay was made in fine style, the larger yachts gradually leaving the smaller ones in the heavy roll of the sea. Off Whaleback Light the leading yachts laid to, to await the smaller ones, the Alice rounding to about four minutes in advance of the White Cap, which led the Brenda by about the same distance, while the Tempest came next, and the Vif, with the two cutters and the Nimbus followed with the latter in the lead. As the last yacht came up all stood up Portsmouth Harbor, and rounding to above the fort, dropped anchor off Newcastle.

After dinner, all hands went on shore for a visit to the "Wentworth," about a mile from the landing, a part of the number taking a barge while the larger number preferred the exercise of a short walk, under the lead of the sturdy commodore. An hour or two was very pleasantly spent at this noted summer hotel, already crowded with visitors, its grounds and verandas brilliant with electric lights, which shine far out over the open sea to where the "flaming signal" on White Island, at the Shoals,

"Answers you, passing the watchword on."

On the return all took to the barges, which, by the way, can be had at Newcastle for a moderate expense (and are very good) for a visit to any place in the vicinity.

After a few songs from the Temple Quartette on the Brenda, and an impromptu quartette on the White Cap, christened the "Pagodas" by the boys, all hands turned in.

At 8 o'clock on Monday morning the smaller yachts got under way, in charge of Vice-Commodore Crane on the Vif, followed by the four larger yachts an hour later, heading for Portland after rounding Whale Rock Light with a light westerly breeze. The day was perfect, and only the long, heavy southeast roll of the sea continued to impede the progress of the fleet. Off Wells Beach the westerly breeze died out and a southerly one sprang up. The Tempest being in the lead slightly, and outside, caught it first and shot ahead, while the other large yachts took it later. Off Cape Elizabeth the larger yachts again laid to, and all came up; the Tempest having held her lead, followed by the Alice, Brenda, White Cap and others. The fleet then stood in for Portland Breakwater in close order.

On the way up, and while lying to, a large coasting schooner exhibited a specimen of viciousness only too common. She first tried to run into the Brenda while the latter was lying to, and only missed her by about thirty feet by the activity with which she was kept away. Afterward as the White Cap was passing to windward of her, within about fifty feet, to avoid a buoy on a dangerous ledge the captain of the schooner deliberately ordered his helmsman to luff sharp up out of his course, to run into the yacht, but the latter was brought up just in time past the buoy to escape by superior speed in shooting ahead under a quick luff. As it was, the great jib boom of the schooner just touched the yacht's mizzen as she forged ahead. Such conduct when the wind was fair and done so maliciously, certainly deserves the most severe condemnation, if not some penalty to be imposed.

The fleet rounded the breakwater in close order and came to anchor opposite Portland, thus bringing to its limit a successful cruise, which will long be remembered by those who enjoyed it. From here the Tempest kept on to the eastward, the White Cap visited Casco and Booth bays, and then with the rest of the fleet returned, filling up five days out and back.

The Hull Y. C. has displayed a spirit of enterprise in these cruises, which is greatly to the credit of its members. The owners of the small yachts particularly deserve great credit for so boldly displaying the merit of their craft in the long run in a heavy sea in company with such larger ones as Brenda, Alice, Tempest and White Cap. They have demonstrated that the club cruise need not be confined to large yachts, and that its social enjoyments are within the reach of the owner of the smaller boat, which is well equipped for the open water.

AMERICAN Y. C. RACES.

THE American Y. C. will hold their first steam yacht races on the Sound, on Aug. 7, the particulars of which are given in the following circular, issued by the secretary, Mr. Henry A. Taylor:

There will be a rendezvous of the yachts of this club, prior to a regatta and cruise, at the Larchmont Club House, on Wednesday afternoon, Aug. 6 next.

From thence, at 10 A. M. on the following day, there will be a race around the lighthouse off Stratford to abreast the lighthouse at New London, and prizes of equal value are to be competed for in two classes of yachts, viz, first class, all exceeding 100 gross tons; second class, all under 100; two or more entries in a class necessary to make a race.

The restriction of yachts to but two classes is for this occasion only and is the consequence of there being but two prizes for competition, with allowance of time. A third prize will be awarded to the yacht making the least time over the course without reference to allowance of time.

Owners of steam yachts of any organized club are invited to enter and to compete for the prizes under time allowance.

The allowance of time is that recommended and reported by a select committee and which has been adopted by the club.

Owners of yachts desiring to enter for competition in the above race, or in any that may occur during the cruise, are required to furnish the measurer, Charles H. Haswell, Post Office Box 2,961, New York, on or before Monday, Aug. 4 next, at 2 P. M., at which time the entries will close, with the name, tonnage—as taken from their register issued during the current twelve months—area of grates and character of combustion, as whether natural draft, jet, blast or exhaust, also with a copy of their signal, provided it is not already furnished.

The Regatta Committee will make the necessary arrangements, compute the time allowance and have direction of the race, or any that may occur during the race; and all questions arising between competitors will be decided by them, under the rules and regulations of the club, so far as they may apply, and the decision of the committee will be final.

The Larchmont Y. C. have offered the use of their house and grounds to the A. Y. C. on the occasion of the rendezvous, which offer they have accepted.

PORT ORANGE Y. C. ANNUAL MATCHES.

Editor Forest and Stream:

The fourth annual regatta of the Port Orange Y. C. took place July 4, 1884. The race was run over the Port Orange Y. C. course. Seven boats entered. The day was fine and the wind light from the east, which gave the boats a run over most of the course, but on the homestretch the wind freshened up so as to cause some of the boats to reef and others to take in their light sails. The wind also shifted to southeast, making it a beat most of the way home. The boats had a chance to try the wind in all ways, from dead ahead to right aft. The time made and names of boats are as follows:

FIRST CLASS.

	Ft. In.	Actual.
Ripple, V. Vuillaume	26.00	2 37 40
Gretchen, Fred. Knappe	20.04	2 34 02
Gretchen winning with time allowance in 9.23.		
SECOND CLASS.		
Annie, H. H. Robinson	18.06	3 00 53
Bessie, H. Pacetti	18.06	3 09 33
Magnet, George W. Johnson	15.03	Withd.
Annie winning with time allowance in 8.50.		
THIRD CLASS.		
Comet, V. Vuillaume	18.00	3 34 25
Maud, Fred. Fowler	18.00	3 43 10

Judges—Eugene Marcile, W. L. Bunker, Capt. A. L. Daggett.

PORT ORANGE, Fla. JOHN B. ALLAN, Secretary.

NEW YORK Y. C. CRUISE.

VICE-COMMODORE E. E. CHASE has ordered the squadron to rendezvous at New London on Aug. 9, for the annual cruise. From New London the fleet will cross to Newport, where a number of races, both for sailing and steam yachts will take place.

Commodore Bennett has offered the following prizes: A cup of the value of $1,000 to the steam yacht winning with time allowance, a cup of the value of $1,000 to the steam yacht making the shortest time over the course, a cup of the value of $500 to the steam yacht arriving second without allowance of time. The above race to be over a course of not less than sixty statute miles, and no race unless five vessels start. Cups of the value of $500 each to two classes of schooners, and cups of the value of $500 each to two classes of sloops, to be awarded to the winners of a race from Brenton's Reef Lightship to and around Sandy Hook Lightship and back to the starting point. The race to be without time allowance.

A race will probably be arranged for two classes of launches not over 60ft. waterline, the prizes being handsome cups, also presented by the Commodore. The race for the Goelet cups will also be held at Newport, over a triangular course of 45 miles, with time allowance, the prizes being two cups valued at $500 each, for the two classes of schooners, and cups of the same value for two classes of sloops.

BEVERLY Y. C. REGATTA.

THE first championship matches of the season were fixed for Marblehead, July 9, and for the third time this season the race was spoiled by bad weather. The 8th was thick and foggy, preventing the south shore boats from coming over, and the 9th opened with a strong northeasterly wind, making a dead bent across and preventing their arrival in time.

Just before the start the wind died out, the start was made in a light N. E. wind, making it a dead beat to Bowditch's Ledge; after they had been out about half an hour, they ran into a flat calm, lasting three-quarters of an hour, which was succeeded by light winds from every direction, shifting round so that the first class had a beat all the way over their course, and the small boats almost all the way.

The result was that the race was not made in time, Peri came in first about twelve minutes over the time, with Witch one minute later, then Hoiden, Spider, etc. In first class Thialfi and Countess made a very close race, Countess came into Marblehead Harbor ahead, but while she was beating for the line, Thialfi got a breeze under the shore and crossed without tacking, about half an hour over the time.

At first it was intended to postpone the race till Saturday, the 12th, when a good entry would have been assured, but this idea was abandoned when it was found out that the Hull and Boston Y. C.'s had races on that day, and the race was resailed on the 10th, with a very small entry, as several owners were unable to devote two days to a race in the middle of the week.

The boats went off to a one gun start; first class at 12:20, and the others at five minute intervals, with a brisk W. N. W. breeze. The course for first class was: Leaving R. buoy No. 6, Bowditch's Ledge beacon, Gale's Ledge buoy, stakeboat off S. E. breaker, and Halfway Rock on starboard hand and return, 10½ miles. For second and third classes, leaving Bowditch's Ledge beacon, and stakeboat off Curtis's Point on port hand, B. buoys 7, 5, and 3, and buoy on Selman's Berth on starboard, and return, 7½ miles.

The wind died out at the finish and the boats drifted over the line. Summary as follows:

	Sailing Length.	Actual.	Corrected.
FIRST CLASS.			
Thialfi, slp., Amos Cotting	30.8	3 20 45	3 14 00
Countess, slp., Geo. B. Chase	31.6	3 23 33	3 17 27
Bessie, schr., Chas P. Curtis	27.1	not timed.	
SECOND CLASS.			
Witch, cutter, B. B. Crowninshield	22.6	1 37 28	1 20 20
Peri, cat, Com. Parkman	20.7	1 41 36	1 23 27
Spider, cat, Walter Abbott	20.	not timed.	
THIRD CLASS.			
Mirage, cat, L. M. Clark	19.4	2 04 10	1 49 38
Tulip, cat, Gordon Dexter	18.7	2 19 53	2 4 32

Thialfi, Witch and Mirage take prizes and pennants. Countess and Peri second prizes. BLUE WITH A GOLD CASTLE.

PACIFIC Y. C. OCEAN RACE.

SAN FRANCISCO yachtsmen have made a departure from the usual routine of bay cruises, and on July 5 the Pacific Y. C. turned out for an ocean race. There was plenty of variety—light winds, calms, and at last a tearing breeze with rough water accompaniment, making lively work and an exciting finish.

The fleet was ready early in the morning, but there was very little wind, what there was being from S.E. A large number of spectators were present at Santa Cruz to witness the start, which took place at 10 A. M., Annie crossing at 10:17, Nellie 10:21, Lurline 10:24, Fleur de Lis 10:25, Aggie 10:27. Besides the racers were Casco, Nautilus, Lady Mine and Clara to witness the race.

Fleur de Lis started far Monterey, carrying a breeze for some two miles, when it left her becalmed, the others, who had gone further off shore in search of wind, being in a like predicament. When the wind did come, it was from northwest, Annie catching it first and the others a little later, all but Fleur de Lis, which lay way astern until 11:50, when a breeze found her, and away she went with all drawing to catch the leaders, only Aggie being within sight of her.

Running on to the stakeboat, the Lurline turned first, then Nellie, Lady Mine, Aggie, Annie, all passing Fleur de Lis going one way as they went the other, the leader being ten miles ahead of her.

For a time the wind was light, with calms at intervals, but Fleur de Lis still held on, overhauling the others, and at passing Aggie, the latter withdrew soon after for no apparent reason. After the tempers of the yachtsmen had been thoroughly tried by calms and catspaws, old Æolus relented and sent them wind enough in a lump for two or three good races in the shape of a blow from the west, soon rolling up an ugly sea.

Annie lost her jib at once, and ran into smoother water to set matters right, while the others quickly reefed down. Now was Fleur de Lis's chance, and she was driven through in a way that soon put Annie under her lee, and finally placed her less than a minute behind Lurline at the finish, the full time being:

	Start.	Finish.	Actual.	Corrected.
Lurline	10 25 48	5 03 20	6 37 32	6 37 32
Fleur-de-Lis	10 26 43	6 03 53	7 36 50	7 22 48
Nellie	10 22 04	6 05 34	7 43 30	7 26 00
Annie	10 17 43	7 02 05	8 44 22	8 14 34

The prizes, which are of silver, were awarded; first to Lurline, second to Fleur-de-Lis, third to Nellie, and fourth to Annie. In the evening a ball was given at the Ocean House, at which the prizes were presented.

CUTTERS ON THE LAKES.

THE contest between sloops and cutters has at last extended to Lake Michigan, and the cutter has scored a grand victory on the occasion of her introduction to Chicago yachtsmen. The following letter and the extract from the Chicago *Tribune* tell the story plainly. In a storm that scattered the fleet, forcing the large yachts to seek a harbor and disabling several of them, the little Verve, 42ft. on waterline, was first in at Milwaukee, some six hours ahead of the famous Idler, 46.5ft. long. The race that followed was no less remarkable; in weather in which the racers declined to sail, Verve started out, the Wasp alone caring to accept the challenge, and in a race of 18 miles the cutter was beaten by but 13min. 51s., the sloop being a new and powerful boat, 64ft. on waterline, 19ft. 10in. beam, and 6ft. draft. Our correspondent writes: "Wasp is a 50-ton centerboard sloop, Verve is a 10-ton, deep draft cutter, recently imported from Glasgow. She is the first cutter on Lake Michigan, and is, as the clipping says, a 'revelation;' it having been freely asserted, publicly and privately, that she could be no match for the local yachts. The proof of the pudding is in the eating, and Chicago yachtsmen are eating 'cutter pudding' just now." The following details are from the Chicago *Tribune*, July 5:

The members of the Chicago Y. C. are thoroughly disgusted with their trip to Milwaukee. For nearly two days and nights they were either drifting hopelessly along without the faintest suggestion of a breeze, or were tossed and tumbled about by the turbulent waters of Lake Michigan. They have been chilled through by murky fogs, drenched to the skin by heavy seas, and scorched by glaring sunlight until sharp rheumatic pains dart through every limb, while their burnt and blisted faces have much the appearance of boiled lobsters. There is not one but wished he had stayed at home and enjoyed the quiet seclusion of his club, but it would be unsailorlike to admit his weakness, so he smiles a ghastly smile and tells about the rollicking jolly time the boys had after the gale caught them.

All of the boats, with the exception of the Wasp, left the Government Basin at Chicago about half-past 4 o'clock Thursday afternoon, and slowly drifted out between the opening in the breakwater onto the lake. It was ten minutes of 5 when the Wasp got away, and at 8 o'clock in the evening the boats were scattered along the shore from Lincoln Park to the crib, their sails flapping against the masts and scarcely a breath of air stirring. About 10 o'clock a squall from the northeast struck the squadron square in the face, and they flew down the lake under double-reefed canvas. The crew of the Zephyr got all they wanted and ran back home. The other yachts separated and saw no more of each other until morning. The Wasp and Verve shot ahead of the others and were soon lost in the darkness. The Idler stood out into the middle of the lake in order to prevent collision or from being blown on the beach. Then the rain fell in torrents and the gallant commanders and their guests went below.

Capt. A. P. Seymour's new sloop-rigged yacht, the Mamie, was the first to suffer disaster. Capt. Seymour was at the wheel when the squall came, and had just given the order to take in sail when the topmast snapped like a pipestem and went by the board. A heavy sea swept over the decks at the same time and she was thrown on her beam ends. When she righted it was found that the small boat and davits had been carried away. She hove to and cast anchor just astern of the flagship Cora. A few moments later she narrowly escaped being run down by a lumber schooner, and throughout the rest of the night torches were burned. There was a narrow escape from loss of life on the Cora. Two of her crew were washed from the deck by the sea, but life lines were thrown to the almost drowning men and they were picked up and saved.

The squall died away before daybreak and was followed by a dense fog, so that the boats lost sight of each other most of the time. About 4 o'clock in the afternoon the wind freshened up considerably and steadily increased in violence till after 9, when a brisk gale was blowing from the southeast. Under its influence the yachts fairly flew through the water, and at an early hour this morning three of them had cast anchor in Milwaukee Bay. As they came straggling in at the peep of day an object was seen on the waters which appeared to be a large-sized pumpkin seed with a stick standing up in the middle of it. The squadron approached it, and found it was an odd-looking boat lying at anchor. On the stern they read the name Verve.

That little pumpkin seed, built on the Clyde and brought over the salted deep, to Chicago, had been the first of the Chicago fleet to reach Milwaukee, and was awarded the basket of wine. She cast anchor at 11:30 Friday night. The Wasp got in nearly a half hour later, and the Idler, Cora and Harry Burke about breakfast time. The Una and Mamie were missing. At 4 o'clock this afternoon the Mamie arrived in tow of a tug. She ran into Oak Creek about half way between here and Racine for shelter, telegraphed for a tug and was towed in. The Una has not been heard from, but she was in company with the Cora off Racine and probably made that port for shelter.

It is not decided yet when the yachts will return, but they will all go back independent of each other. The owners and their guests are quartered at the Plankinton House, and are being entertained at the Milwaukee Club to night. The Mamie will be repaired here, and will leave Monday for Thunder Bay, Lake Superior, on a three weeks' fishing cruise. The Rev. Luther Pardee, rector of Calvary Church, and the Rev. T. D. Phillips, both of Chicago, and the Rev. W. F. Taylor, of the Springfield Diocese, are on board.

In some respects the regatta that was arranged to take place this morning was a failure. In other respects it was the most exciting exhibition of yacht sailing ever witnessed on Lake Michigan. The wind was blowing a living gale from the west, the velocity being estimated at fully forty miles an hour. It was a gale that drove many large vessels into the harbor for shelter, and it is little wonder that all of the Milwaukee yachtsmen and all but two of the Chicagos refused to venture out.

It had been arranged to sail an eighteen-mile triangular course, and

the United States revenue steamer Andy Johnson marked off the course at an early hour. The Johnson and the propeller Michigan had large parties of visiting guests, among whom were several distinguished statesmen, members of the Board of Trade, and a liberal sprinkling of ladies.

At 11:15 the starting gun was fired, but none of the yachts made any preparation for the race, although the Idler and Wasp had their mainsails set. Then it became rumored that the majority of the yachts would not sail on account of the heavy weather, and that the race had been declared off.

But the British cutter Verve made sail and commenced cruising around the bay. Her graceful evolutions excited Capt. John Prindiville, and he ordered the Wasp got under way. At 11:36:20 the Wasp crossed the line under double-reefed mainsail and staysail and sped along the course. She proved to be a marvelous seaboat. She stood up beautifully before the gale and fairly flew through the water, the wind abeam of her. The Verve followed, crossing the line at 11:38:05. The Verve was a revelation to yachtsmen. It had been predicted that she could not stand a gale of wind. She didn't stand, but she laid down and skimmed along the white-capped waves with the speed of an antelope. Jerry Stever, her owner, lashed himself to the rail while his English sailing-master stood in the cock-pit at the tiller. The crew of eight were lashed to prevent being washed overboard. At times boat and crew were completely buried in the sea, with only a portion of the mast and canvas above water. The main-boom was under one third of the time. The guests on board the Johnson momentarily expected to see the Verve swamp, and both cutters filled with life-preservers were cleared away and made ready to launch at a moment's notice. They were not needed, however.

The Wasp rounded the first stake boat at 12:06:11 and the Verve at 12:15:04. In rounding the second stake the Wasp missed stays and was obliged to wear around, and in doing so sprung her mainboom and carried away her jib sheet. She got around the stake at 12:47:50, but was so badly disabled that she hoisted a flag and signaled for a tug to tow her in. The staysail was finally set, however, and she started for the finish. Oscar Krause was on the Wasp, and in jibing was swept by the mainboom into the scuppers. He was caught by the heels and saved from being washed overboard. The Verve floundered along and rounded the second stake at 1:02. The Wasp finished at 1:23:09 and the Verve at 1:37. Archie Fisher says he has seen many exciting contests on salt water, but none of them compared with to day's exhibition.

SALEM Y. C.—None of the yachts succeeded in sailing over their courses in the allotted time on July 4, so that the race will be sailed over on Thursday, July 17, under the same regulations as the previous match.

SEAWANHAKA CRUISE.—The secretary has issued a notice, dated July 9, stating that the cruise has been indefinitely postponed, by order of the commodore. Notice will be given of the time appointed.

BAY OF QUINTE Y.C.—At a meeting of this club on July 8, the date of the annual matches was fixed for August 6, the start to be at noon. This will be the third race under new Lake Yacht Racing Association's management; large entries are expected. The circuit fixed on is from Oswego on July 30, to Kingston, Aug. 2, Belleville August 6, and afterward to Cobourg and Toronto, all the clubs being represented. The prizes for the races on the 6th will be for first clas $150, $75, $30 and $10; second class, $100, $50, $25 and $10; entrance fees, first class $10, second class $7.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

F. E. W., South Manchester, Conn.—Will five medium-size brook trout live in a well? Ans. They may live but will not grow much.

J. M. M., Toronto.—Can you tell me if quassia is a good repellent for flies and mosquitoes? Ans. It is said to be, but we never had much success with it.

PARK, Red Hook, N. Y.—What disposition did Congress make of the Yellowstone National Park bill? If passed, did it pass as published in FOREST AND STREAM? Ans. The bill referred to passed the Senate, but is, we believe, still in the hands of the committee of the House to which it was referred.

READER, Astoria, N. Y.—Is there any difference between a black bass and a sea bass? Where are they found and where do they spawn? Ans. The black bass is a fresh-water fish, found in lakes and rivers; it spawns in June in this locality. The sea bass is a salt water fish, which spawns in July and August.

W. S., Tampa, Fla.—Can you tell me where the orchid is to be found in Florida? It resembles the passion flower rather. Ans. The description is too vague. There are many members of the orchid family growing in Florida. We have seen twenty in one collection, and know of none that can be said to resemble a passion flower.

D. C., Minneapolis.—1. Is the red snapper caught in the waters of Mississippi Sound? 2. What is the best time to catch them? 3. Do they sell readily in the markets of New Orleans and Mobile? Ans. 1. They are caught in the Gulf of Mexico mainly, but some are taken east of Florida. 2. In the winter and spring. 3. Yes; also, in New York.

F. W. G., Erie, Pa.—Is the preparation called "Rex Magnus" safe for use? Some time ago I saw it stated in the New York papers that the Board of Health had condemned its use as dangerous. I expect to take in the Nepigon, etc., this season, and would like to take with me something that will enable me to bring home in good condition a half dozen of my largest fish to astonish our local fishermen with, and had thought of using Rex Magnus, but of course do not want to do so unless it is perfectly safe. Ans. We believe the preparation to be perfectly safe. Have used it ourselves without any ill effects, and have heard it recommended by chemists in no way interested in its sale. We believe that the Brooklyn Health Board pronounced it deleterious, but have not the particulars.

POT LUCK FROM EXCHANGES.

GOOD TO TAKE ALONG.—The *Sun* cholera mixture is a remedy for the ordinary summer complaints, colic, diarrhœa, dysentery, etc. Take equal parts of tincture of cayenne, tincture of opium, tincture of rhubarb, essence of peppermint, and spirits of camphor. Mix well. Dose, fifteen to thirty drops in a wineglass of water, according to age and violence of the attack. Repeat every fifteen or twenty minutes until relief is obtained.

The personal appearance of the catfish is against him. His moustache, although thin, is too prominent, and his forehead altogether too wide to be in keeping with his chest measurement. Then his complexion is bad, and when he smiles he exposes rows of pale gums totally destitute of teeth. No, the catfish is certainly not prepossessing. But he must not be judged by his looks. Beauty is but skin deep, any way, and beneath the dark coat of the catfish there lies meat as tender as that of any fish that swims. It is time that justice were done the catfish. He is humble and unobtrusive, and has been content to lurk in obscurity while carp and pretentious fish have paraded themselves for the admiration of the multitude. Yet there are few of the finny family worthy to be compared with him in those solid qualties which fit a fish for the pan. For it is in the pan that the catfish is pre-eminent. Other fish may do well enough to broil, or for chowder, but who shall say that the catfish can be surpassed in the pan? The S. F. *Exchange* and other dyspeptic journals may carp at the catfish as they please, but let the catfish be properly cooked and he need fear no rivalry. He is as tender in death as he is tough in life.—*Sacramento (Cal.) Bee.*

KEEP pace with the times. This is what the Esterbrook Steel Pen Co. are steadily doing with regard to quality, new designs and general perfection of their goods.—*Adv.*

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF
Horses, Cattle, Sheep, Dogs, Hogs & Poultry.

For Twenty Years **Humphreys' Veterinary Specifics** have been used by **Farmers, Stock-breeders, Horse R.R., Travel'g Hippodromes Menageries** and others with perfect success.

LIST OF SPECIFICS.

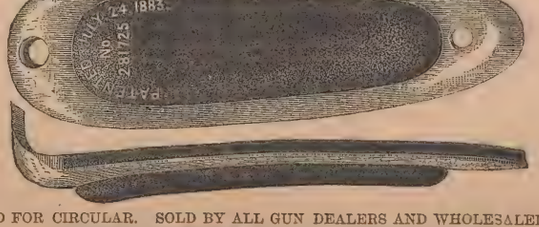
KYNOCH'S

Patent "Perfect" Brass Shells,



MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

T. G. DAVEY, Publisher, London, Ont.

EXCELSIOR BAIT PAIL.
(Patented). **The Fisherman's Friend.**

There is an inside pail which can be removed and placed in the water the same as a "fish car," thus keeping the bait alive for an indefinite time. The pan which fits in the inside pail can be raised and lowered, thus affording an easy selection of bait without wetting the hand. The bait is kept alive during transportation (the critical time) by the continuous flowing of the water through the perforations, thus causing a never failing supply of fresh air. For sale by all dealers, or will be sent on receipt of price. 8 Quarts, $2.50 each; 12 Quarts, $3.25 each. Manufactured only by DE LA VERGNE & CO., 176 Chambers street, New York.

THE PETMECKY

GUN CLEANER.

The only Cleaner that will thoroughly clean a gun barrel, doing the work equally well in choke bores without adjustment. Will do the work quicker and better than all other implements, for the purpose, combined. Price, $1.25. By mail, 10 cents extra. Ask your dealer for it. Discount to the trade. Circular free.

J. C. PETMECKY,
Wholesale Dealer in Guns, Fishing Tackle, etc., Austin, Texas.

Pocket Mosquito Bar.
(Holden's Patent.)

No discomfort in wearing day or night. No trouble to put on, convenient to carry. Try one unless you are mosquito proof. Sample by mail, $1. Worth $1 per day in mosquito season.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JULY 24, 1884.

VOL. XXII.—No. 26. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. American newsdealers should order through the American News Company, those in England, Scotland and Ireland, through Messrs. Macfarlane and Co., 40 Charing Cross, London, England.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.
PUBLISHER'S DEPARTMENT.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, yachting, canoeing, and kindred subjects, than is contained in all other American publications put together.

THE GREELY RESCUE.

WITHIN the week the wires have flashed around the world the news that the Greely party had been rescued. The pitiful remnant of seven out of the twenty-five men who made up the expedition have been found alive. They were starving, weak, almost in the death agony, when the rescuing ships reached them—only just in time. Two days more of this weary waiting would have ended the struggle for all. The eager hands that have now brought life and happiness to the survivors, would have had only the mournful task of carrying to the ships, which were to bear them home, the lifeless forms of the whole party. It would have been another DeLong tragedy.

The sorrowful tale of suffering and death is told on another page. The heroism of each member of the little band is unconsciously brought out in the graphic narrative of the survivors. Everywhere throughout the account appears the fact that the success of the expedition was very largely due to the fortitude and ability of its commander. For the expedition was successful, notwithstanding the fact that three-fourths of its members perished miserably of starvation. During the three years of their sojourn at Lady Franklin Bay, there was but a single death, and they did not begin to suffer seriously until, despairing of a rescue, they left Fort Conger in August of last year, and moved southward, leaving behind them eight months' provisions. The difficulties and dangers of the march greatly reduced the stock of food which they had taken with them, so that throughout the winter passed at Cape Sabine, they lived on quarter rations. At length their provisions entirely gave out, and they were reduced to eating their sealskin clothing.

Up to the time of the arrival at Cape Sabine the health of all the men had been excellent. Scurvy, the most dreaded disease to which travelers in the Arctic are exposed, had not attacked them. Their camp at Cape Sabine was opposite the spot where the Proteus sank in 1883, and yet no adequate supply of food was found to have been deposited here for the benefit of the explorers. A few stores had been tossed ashore and abandoned, but nothing had been done in the way of establishing a depot of supplies. Lieut. Greely is reported as saying that if 500 pounds of meat had been left at Cape Sabine by the Proteus the lives of his whole party would have been saved.

The terrible loss of life appears to have been due wholly to the mismanagement of the authorities at Washington. Garlington was ordered to push through to Lady Franklin Bay, and in trying to do so lost the Proteus, and turned back. By some strange fatuity he had been ordered to leave provisions on the east side of Smith's Sound instead of on the west side, where Greely was stationed, and where the latter had directed that supplies should be left. Even without such instructions it might have been supposed that in the event of a retreat being made the natural thing for the party to do would be to make its way south along the coast as rapidly as possible. Smith's Sound in the late summer—the time at which such a retreat would be begun—is often partially open water, and impassable for heavy boats or sledges.

The Greely party—as was to have been expected—retreated down the west coast of this body of water, while the careful authorities at Washington had laboriously placed all the provisions on the other side of the sound, at Littleton Island and elsewhere. Thus, when the party under Greely reached Cape Sabine they found no stores, although two costly expeditions had been fitted out and despatched to their rescue. Through sheer stupidity and blundering at Washington nineteen out of the twenty-five men belonging to the party were thus allowed to perish.

The work done by the expedition is said to be most important. A vast quantity of meteorological and magnetic observations have been made, and many photographs secured. We shall know better what the scientific results of the expedition are after they have been submitted to the examination of specialists.

It is apparent that if the work of Arctic exploration is to be continued, those who are to engage in it must be protected in every possible way from the dangers to which the dweller in the Arctic is inevitably exposed. Of all the circumpolar meteorological stations, Fort Conger was in the most dangerous position, from the fact that it was accessible only about once in three years, and yet these men were allowed to station themselves there without having any base of supplies on which they could depend. They were to rely for rescue wholly on the chance of an open summer, when a ship could come through to them. There are many people who believe that this exploratory work should cease—that the results to be obtained from it are not commensurate with the suffering and death which has ensued. The work of the Greely party, however, shows very clearly that such Arctic observatory stations can be supported, and that the observers may maintain themselves, even in this rigorous climate, without any great degree of suffering and in perfect health. But to do this they must have food.

Beginning at some point which is always accessible, on the west shore of Smith's Sound, houses should be built at short intervals, certainly not more than fifty miles apart. Each of these houses should be as well fitted up and as well supplied with provisions, tools, and all the implements and articles required in Arctic travel and living as if it were to be the winter home of an expedition for several years. Then from the northernmost of these houses, a short advance should be made and another station built, fitted up and supplied. No long advance northward should be permitted, no matter how apparently favorable the conditions, but a slow and steady progress should be made, each summer being devoted to the establishment of a station further north than the last one. Each summer vessels should be sent out carrying men and material, which should be left at the northernmost station accessible, and thus the waste at the northern end of the line would be constantly supplied. The observers would be always within easy reach of warm quarters, and the supply of food could be made inexhaustible.

It may be objected that the plan suggested would be enormously costly and very slow, but even so, it would be sure to accomplish what is required, and the money would be well spent which should save human life and lessen human suffering.

If these explorations are of real scientific value, as we believe, it is certainly worth while that they should be carried on with such system that they will be productive of the best results.

A SPORTS DEFENSE SOCIETY.

IN its original form the bill introduced into the English Parliament to suppress pigeon shooting contained a clause extending the operation of the act to "any vertebrate animal, whether of domestic or wild nature, kept in confinement or captivity." This was a blow at the sports of hunting the carted stag and coursing hares in inclosures. The followers of these three pastimes, with other sportsmen, regarded the bill as "the thin edge of the wedge," and they thought that in time other sports, fox hunting and grouse shooting, would be interdicted. Accordingly a society known as the National Sports Protection and Defense Association, has been formed. Its avowed purpose is to resist all measures intended to interfere with the various forms of sport mentioned, and our English exchanges report that the membership of the association is sufficient guarantee of its influence in this direction.

We surmise that the society will be powerful so far as it keeps abreast of and reflects the popular sentiment of the times. If public opinion in Great Britain condemned hunting a carted stag and chasing rabbits in inclosures, as public opinion does in this country, no society could withstand the attacks that would be sure to be made—and eventually with success—upon these practices. No society could ever be formed in this country strong enough to bolster up the repute of such exhibitions as, for instance, are occasionally given by the Newport huntsmen in their chase of maimed foxes.

"WHO WINS?"—This is the query propounded to newspaper editors by anxious correspondents. Most often the dispute is over a game of cards, or a bet on a horse race, or a presidential election. Our esteemed contemporary, the *Spirit of the Times*, usually attends to the card and horse puzzles, and the New York *Sun*, in addition to its matrimonial advice, dispenses oracular utterances on election bets. It is with no little jealousy that the FOREST AND STREAM witnesses the confiding trust of the bet-befogged public in other journals, while its own opinion on similar themes is seldom sought; and it is with a genuine thrill of complacency that we once in a while read a letter like this: "Hamburg, N. J., July 11. *Editor Forest and Stream:* Will you be kind enough to decide the following bet through the columns of your valuable paper? A bets B that he can tell him where he got his supper on a certain night. They bet, A names the place where he supposes B ate supper, and B says 'I had no supper.' Is the bet a draw, or who wins?—STIFF." Now, if we should devote our time and intellectual powers to the earnest consideration of such intricate problems as this, we might in time convert the FOREST AND STREAM into a vehicle for the dissemination of useful information; but we shall do no such thing. We smother the ambition that would lead us into such an exalted path, and deeply as we are touched by the confidence displayed in us by "Stiff," we must content ourselves with keeping the FOREST AND STREAM what it is to-day, a journal of shooting and angling, the best in the world, and we shall do this even though A and B and all the rest of them remain forever suspended on undecided bets.

THE FOOD OF NESTING BIRDS.—The very interesting communication on this subject published in our natural history columns last week deserves more than a passing notice. The observations there recorded by this careful observer teach a lesson to the agriculturalist which he will do well to lay to heart. They show how important it is that our insectivorous birds should be rigidly protected, not by law alone, but by public opinion as well. If we assume that at each visit to the nest but a single insect was brought—and probably five would be nearer the truth—we see how great a check these birds are on the rapidly multiplying insect life of our summer months. Of these insects a large proportion unquestionably belong to species injurious to vegetation, and their destruction is of the greatest benefit to the farmer. It is this class above all others that is especially interested in the protection of our small birds. The care and patience of the observer during his long vigil deserve high praise.

THE MARYLAND ASSOCIATION.—The Maryland Association for the Protection and Preservation of Game and Fish has gone out of existence, owing, it is said, to the indifference of its members. This is the more to be regretted because of the importance of the work which the association was organized to do. We hope to see a revival of the society.

The Sportsman Tourist.

MEMORIES OF SENACHWINE LAKE.

BY T. S. VAN DYKE.

Second Paper.

AROUND Senachwine Lake I spent that fall nearly three months in uninterrupted shooting, for in those days I cared nothing for the difference between rain and shine. Many a day I threaded the driftwood, snags and elbows of the slough below Senachwine, where the wedge-shaped wake of the muskrat or the dart of the pickerel rippled the dark water before the boat, and ducks rose quacking or squealing from every little cove or inlet or from behind lodged masses of driftwood. Yellow-legged snipe, both large and small varieties, trotted along the shores of open mud or stood bobbing and craning their long necks until I could almost reach them with the oar; then rising, with clear and penetrating cry and long legs dangling behind, they would wing their way with a vast display of fuss and feathers some ten or twenty yards further up stream, to repeat the same programme in about half a minute. Upon the same open, muddy shores the English snipe were about as abundant as the others, for in the West they frequent this kind of ground about as much as any kind. At almost any time I could see two or three of these snipe and often more trotting along the water's edge, probing the soft mud at every few steps with long black bills, scarcely noticing the boat until it came within a few feet, then with a sudden *scape* and erratic twist one would twitch himself away, dart skyward, pitch to the right, pitch to the left, deliver himself of many a *scape*, then after a long detour make a sudden wheel and, like the thread of a corkscrew, come down about fifty yards further up stream. Wisps of small gray snipe, sandpipers, etc., often whisked by with soft, insinuating whistle, and an occasional flock of plover skimmed along the muddy bars.

But at such times the gun was hardly ever raised from its resting place in the boat. When I wanted snipe shooting I had far better opportunities. There were still many warm autumn days, when the ducks were lazy through the middle of the day and flew but little until toward evening. On such days I had such snipe shooting as I had never seen before and have never seen since. I have seen snipe in greater abundance, but for easy, tranquil sport, freed from the wear and tear, from the work, mud and annoyances of ordinary snipe shooting, without the tremenduous strain to which patience is often subjected until broken on the wheel of waiting, I have never seen anything that approached the shore shooting along Senachwine Lake in those days. Along its shores was a boggy strip for from five to fifteen yards wide. For a few feet along the water's edge this was soft open mud. This soon merged into thin, short grass, which grew taller and thicker, with the ground drier as the shore receded from the water; the width and wetness of the two strips depending upon the rate at which the water had fallen in the two or three weeks preceding. On some days there would be two or three English snipe to almost every yard of this strip of shore, and when the wind blew up or down the lake, grand was the sport that could be had with this wayward little beauty. Though fat and untroubled by hunters, he was still saucy and swift, and up wind would test severely your quickness and your gun. But when you were walking down wind along that strip, he pitched and tacked about on your right or left or shot skyward over your head in rapturous style. Rarely was there any need to fire at those that might fall into the lake, for there were birds enough that went by on the land side.

Along the shore at the foot of this lake occurred that fall a remarkable piece of "pot-shooting" that will give some idea of the abundance of snipe. My friend, Henry Ruggles, of Henry, a capital duck shot and one of the best hunting companions that ever lived, had long looked with pitying eye upon my total depravity in shooting such small birds as English snipe.

But once, about the middle of the day, when ducks were unusually slow in coming to our blind, and Ruggles was tired of smoking and picking cold roast duck, and the flies would not let him sleep, he actually condescended to shoot a snipe, it being absolutely necessary to do something to kill time. He left me, and was gone less than an hour. During that time I heard him shoot twelve or thirteen times, certainly not over fourteen times at the outside, and all of these shots came from the same place. He came back and tossed a bunch of Enalish snipe at me and said:

"Hanged if I didn't just sit down behind a bush on the edge of the lake and pot 'em all in one spot, sometimes three or four at a shot." To my certain knowledge he had not a snipe when he left me and there was no one near from whom he could have got them. I am almost afraid to tell the number of snipe in that bunch. There were exactly twenty-seven. And recollect that they were all English snipe and that Ruggles had nothing but coarse duck shot with him.

Though ducks in the West do not come to decoys in the autumn as well as they do in spring, there are still many days when they come quite well, especially wood ducks, teal and bluebills. Many a time during the middle of the day we pulled the boat into a blind of reeds and willows, and set out decoys in the open water a few yards outside the brush, and many a time did I have to drop the roasted snipe or pumpkin pie and snatch up a gun as the air began to sing beneath descending wings. And many a time, when yielding to the soporific influence of a heavy lunch on a soft Indian summer day, did I suddenly start from the land of Nod just in time to hear my comrade's gun from the other end of the boat, to see two or three ducks come whirling and splashing below, while the rest of the flock were towering nicely skyward just as I got hold of my gun.

What camp-fires roared along the Illinois in those days! It saddens me to think that such days may come no more for me. Driftwood piled as high as we could throw it shot a glare across the river until the dead cottonwoods upon the other side looked like imploring ghosts with arms stretched heavenward, and we could almost see the white collars on the necks of the geese that passed high above us. Bunches of mallards, wood ducks, sprigtail, etc., hung around the fire, with every color glowing brightly as in the evening sun, and naught was needed save a string of trout or a deer to make the scene complete. Cold and all other jars that shiver this mortal crockery were banished there, and all thought of the whole outside world went whirling away into the vortex of flame and sparks that streamed skyward through the treetops. Little did I hear of the song or jest or the laughter that almost woke the echoes from the eastern bluffs. For by some strange principle of suggestion, some mysterious mental connection, the whole outer circle of darkness was to me a picture gallery upon which I could lie and gaze by the hour. The walls of that dark rotunda beyond the fire were for me full hung with the brightest scenes of the new life I had entered, and they drew with them by association all those that I had passed through before. There again was the bright sky swept by long strings of whizzing life widening out and streaming toward me in swift descent; and by its side was the old dog rolling with happy gallop over the buckwheat stubble, slackening into a catlike tread as he swings to leeward of the clump of brush in the corner of the field, stiffening into rigid faith as he crawls under the fence and enters the tangled woods beyond. There again was the stately mallard or more gorgeous wood duck relaxing his hold on air and falling a whirl of brilliant colors, or the wary old goose, with drooping neck and folded wing, coming to earth with impetuous crash; and by their side the catbrier brake or hemlock-clad slopes, where the wintergreen fills the air with its fragrance, while the ruffed grouse shoots like a shaft of light among the dark ranks of tree trunks. And bright among them all were those autumn days, when the bloody sun struggles down through smoky air, and the whistle of the woodcock's wing in the sapling grove sends through the heart a more tender thrill than ever. Succeeding years have hung many a new picture in the dark rotunda that surrounds the camp-fire; but none of them in all the freshness of youth shine with more brilliancy than still through the mist of years shine those around the camp-fires on the Illinois.

Lulled to sleep by the *too-whoo* of the great owl, the *scape* of traveling snipe, the frequent *honk* of passing geese, the *clank-a-lank* of brant, the quack of mallards in the lake near by, or the *grrroooo* of the sandhill cranes traveling far up in the dome of night, we got up before daybreak to get upon our stands for the morning flight of ducks.

Though the morning flight of ducks is often very heavy, it generally lacks that tumultuous intensity of presence that characterizes the evening flight. Beginning with the first gray of morning, when a lonely mallard perhaps comes winging his way slowly out of the circle of darkness around you, crosses the open sky above in dim outline, doubles up at the report of your gun and sinks at your feet with a sullen whop, the flight increases with every new beam of light that struggles through the misty morning. They fall no longer from above, as in the evening, and stream in from every other quarter of the horizon about as much as from the north. There is less rush and bustle, but they move with steadier march. They are not shot by you in volleys like projectiles from some uncontrollable impulse, but they move with more majestic sweep and more as if they had some inkling of what they are about. At the first report of your gun the air throbs beneath the beat of thousands of wings, and a wild medley of energetic quacks, dolorous squeals, melodious honkings and discordant cackling as the myriads of ducks, geese and brant still roosting in the ponds rise in a clamorous mob. Again, for a few moments the tyro may lose his wits as the vast horde breaks into a hundred divisions, each circling perhaps a dozen times through the lightening sky and streaming over his head without remembering or caring that it was from that spot that the fire just spouted skyward. As the fire again leaps upward the circle of sky overhead is cleared for an instant as the ducks sheer and climb the air out of danger's reach; but in another moment it is thronged again with rushing wings. Beware, now, how you waste your fire upon this flock of teal just emerging into the gray, for you can hear the mallards' heavy wings, a hundred strong, beating the dark air close behind them. Beware how you waste your fire even upon the mallards, for upon the right the deep-toned honk of the goose sounds most thrillingly near. But, alas! how can the tyro reason calmly when the hiss of a sailing flock of mallards is heard just behind his head before his premises are thought of, and his conclusion is rudely hastened by a deep, dark line of bluebills pouring out of the remnant of the night upon his left?

This lasts, however, but a few minutes. As soon as dawn has fairly begun the wildfowl travel wider and higher, you must keep yourself well concealed and do your very best shooting. For an hour or two, and often longer, the flight may be strong and steady and then it will shade gradually off until you may find yourself waiting fifteen minutes for a shot. The evening flight rises by rapid steps to an overpowering climax, while the morning flight tapers away into all the flatness of the anti-climax.

One scarcely needs to be told that neither the morning nor evening flight is always during duck season such as I have described it. There are days when ducks will not fly as they will on other days, though they still throng both lake and slough in myriads. At such times the flight of those that do move is more over the face of the water than elsewhere, and then I have had rare sport from a big barrel sunk almost to the edge in the mud and water of Swan Lake, a little below the foot of Senachwine. Through a fringe of reeds around the edge of that barrel I have watched great flocks of mallards skim low along the water until the long green necks glistened within ten yards of the barrel. Then as I suddenly rose to my feet, what a glorious medley of flashing bars on terrified wings, of shiny cinnamon breasts, white banded tails, with curls of burnished green, red legs and beaded eyes rose whirling and quacking upward. There, too, I have watched the geese winding slowly down out of the blue sky until near the center of the lake, then, with set and silent wing and every honking throat hushed as if in death, every neck and head immovable, drift softly along a few feet above the water, until, as close as the corner of the ceiling where I sit writing, I could see their eyes sparkle in the sunlight. And then what an uproarious *wiff, wiff, wiff*, of sheering wings, what a *honk-wonk-onk-kwonk*, and what a confusion of white collars and black necks, of gray wings and swarthy feet would crowd upon my eye as I rose and looked along the gun!

It is sad to think that such scenes are fading fast into the things that were. There are, perhaps, parts of our country where the scenes of Senachwine twenty years ago are still repeated. But it may be doubted if they are repeated on so grand and varied a scale; and even if they are it will not be for long. The increasing interest in game protection will preserve many kinds of game to such an extent that our children's children may see shooting of some kinds better than we now see. But no legislation can recall from the past the mighty hordes of wildfowl that once darkened the waters of the West, that dotted its skies and made its cornfields alive with roaring wings. Nor can any public sentiment, whether expressed in laws or not, bring back the primeval solitude of those swamps and river bottoms which were such an important condition in such scenes as I have described. Those vast stretches of timber, broken only by ponds and their margins of mud and reeds, or by the long lines of the winding sloughs, those wide reaches of open land covered with wavy grass or reeds, cut with sloughs or broken by rush-fringed ponds of acres and acres in extent, over all of which one could see no sign of civilization save an occasional road, and hear none of the sounds of progress save once in a while the far off puff of the high pressure steamer that was trailing its sooty banner along the distant sky, can never be restored.

It was at the head of Senachwine Lake that I first made the acquaintance of a nuisance that, in his full development, can be seen only on a Western duck stand. He forms so decided a feature of Western duck shooting that any sketch of that shooting would be incomplete without him.

Mr. Peter Popper, a Chicago parvenu—one of the first of the shoddyites created by the war—had come down for a few days' shooting. He came out to Senachwine in a buggy and planted himself on a piece of dry and open ground about one hundred and fifty yards from where I, hidden in reeds, was standing knee deep in water. He had high-topped rubbers also, but he did not incline to mud and reeds. There were also hundreds of acres of ground just as good as where I was shooting. Yet he drifted as naturally to where he saw some one else killing ducks, as a boy does to the "hole" from which his comrade has just pulled a fish.

The first intimation I had of his presence was the sheering of a flock of mallards that were coming directly toward me, followed by a bang whang of Popper's gun some hundred yards away from them.

"Most too far," I remarked tentatively.

"Oh, no!" he replied. "This gun will kill a hundred yards. Cost three hundred dollars in England."

Having seen plenty of hundred yard guns and their owners, I knew the futility of any reply. It was but a few minutes before a pair of mallards, coming down the water opposite me, rose high with heavy beat of wing, and bang went the first barrel of Mr. Popper's gun again, followed by the other as they got well skyward.

"Those are too far anyhow," I called out rather decidedly.

"Oh, I'm only shooting for sport anyway; I couldn't hit a flock of barns," replied Mr. Popper with consoling tone. He evidently thought that I felt bad to see him miss.

"Why don't you get in the reeds and not let them see you?" I called out in as argumentative a tone as an interrogative sentence would permit.

"Too muddy. I can get all the mud I want in Chicago. Here comes a lot," he replied, with a bang whang at an incoming flock that would surely have given me a good shot if he had been out of the way.

"You are scaring all the ducks," yelled I, somewhat indignantly.

"By Jove," my friend, that's the best I can do. I'm only shooting for fun anyhow. I couldn't hit a flock of barns."

A few minutes passed away, during which I revolved unuttorable things in mind, and in my indignation executed some artistic misses on ducks coming from the direction opposite Popper. Presently a flock of mallards, coming down along the water a hundred yards or more from Popper, but headed directly for the point where I was standing, sheered and sprang skyward at the report of his gun.

"Why don't you let them come further down?" I bawled, somewhat hoarsely, for I was getting mad.

"That's what I'm trying to do. But they won't come down, yah-yah-yah."

"But you are disturbing all the ducks. You don't—"

I finished the sentence with a savage bang whang at a duck that came whizzing down the pond, while Popper was loading.

"That's what I came for," replied he, blandly. "I don't see as you are disturbing them much more seriously though," he added, as my duck went on undamaged.

"But you are spoiling my shooting. Look there, those would have come close to me if you had kept out of sight," said I, as a flock of sprigtails, with long, forked tails trailing behind, sheered off from Popper. Bang went his gun at them, and one, struck at about ninety yards just over the eye with a stray shot, dove head first into the mud.

"Plenty close enough. You only want a good gun," said he, with exultant laugh.

"That was only a scratch."

"It's a wonder you don't make a scratch or two for a change," he replied.

Completely snuffed out, I shouldered my gun and left him master of the field where, far into the twilight, he held undisputed possession.

> "And from about him fierce effusion rolled
> Of smoke and bickering flame and sparkles dire."

A LO HUNT IN THE STAKED PLAINS.

I WAS in East Las Vegas, N. M., running a store and restaurant for a man during the summer of 1881. I had worked hard seven days in the week and was worn down. One day my friend Lew came in and wanted me to quit the store and take a liquor dealer down the Pecos River to the small Mexican plazas in a buggy, as I knew the country and could talk Mexican.

Knowing it would be a pleasant trip and improve my health I consented, and a week from that time found me on the road south. A top buggy and a span of good ponies constituted the team. I had a repeating rifle and a six-shooter revolver, while Singer, the spectacled Hebrew, who was my passenger, had a British bulldog revolver. He was very captious and fault-finding, and told me several tales of which he was the hero, seeming to wish to impress me with the idea that he was a brave man. I have since thought he was afraid of me on account of my arsenal.

We went along from town to town with varying success, selling some goods by sample. Starting from Fort Sumner at about 7 one morning we drove ten miles and came to a large ranch near the road. As we drove up we observed a stir among the people, and when I got out to get a drink of water I was met by Tom S., who owned the ranch. After a hurried hand shake the dialogue was as follows:

"What are you doing down here?"

"Driving that drummer who is selling whisky."

"I lost all my horses last night; stolen by Indians or rustlers [white horse thieves]. I have found the trail; it leads for the Staked Plains. I have got three horses and three good men. Take your horses and come with me after them."

"I will if I can get my Jew to consent," said I. I went out to the buggy and explained the affair to the fellow but he would not go nor let me go. Tom came out and we both begged him to let me go, and Singer "jawed" until Tom got mad, and turning to me said, "Will you go, Dick, if I will square it at home?" I said "yes." So Tom coolly unhitched

the horses from the buggy, leaving Singer sitting in it and told a Mexican peon to draw the accursed Hebrew around into the shade of the house. Singer vowed he would not get out of the buggy. Tom remarked that he could sit there till Hades froze over, if he wanted to, and told him that he would pay him for his time when we got back. We saddled the horses. I filled my pockets with crackers and jerked beef, hung a gallon canteen of water to my saddle, took my gun and pistol and my old cavalry overcoat for bedding, and a lariat, and off we rode, followed by awful talk from Singer, who threatened me and my employer with a suit for damages; said he would expose me—that threat seemed rather indefinite. As we faded away in a cloud of dust, I turned in the saddle and could see him stamping around and lecturing in broken Spanish to an appreciative audience of Mexican peons.

We were five in number. Tom had a Sharps .45-100; one one man a .50-caliber Springfield needle gun, commonly called a "flop over" down here, because the breech opens in a peculiar manner; the two others and myself were armed with Winchester rifles—model of 1873. Every one had a Colt's .45-caliber revolver, single action—the popular pistol of the West. We crossed the Pecos River at the ford and soon found the horses' trail running straight east up on the Staked Plains. The northern and western edge of the plains are at least 300 feet above the prairie, and when you approach them they look like a range of hills, but when you get on top it is a rolling prairie. They are called the Staked Plains because a certain Government survey marked out a trail across them with stakes, as there are no landmarks. They are of an oval shape, hundreds of miles in length and breadth, and said to be waterless. I asked Tom after we had gone a few miles how far it was from the Pecos to water the way we were going, and he said about eighteen miles. By the way, on the road home he confessed to me that it was the first time that he had ever been over ten miles out on the plains, but he dared not say so for fear we would turn back.

We had to travel slowly as the trail was on the grass and the ground hard. Tom lost the trail several times where the horses scattered, but we found it again and found a water hole toward evening. Turning the horses loose with the saddles on so that they could eat, we chewed away at the crackers and jerked beef, and washed them down with water. We ate up half we had and I was still hungry. Then filling my canteen, we pushed on till it was so dark we could not see the track, and made a dry camp on the trail. As soon as it was light in the morning we saddled and rode. In about a mile we came to a well beaten road about four feet wide, with several paths on each side of it running parallel to the main trail. The middle trail was made by ponies dragging tent poles. It must have been used for years. Tom said that he had heard of the path though he had never seen it before. It is the road used by the Comanche Indians and white renegades, who still find a refuge in the Staked Plains when they raid the upper Pecos, and it is called the Comanche War Trail. The horses we were after traveled in the track and we could ride as fast as we dared push our horses. After we had ridden about twenty-five miles from the last water we came to a big water hole that looked like permanent water, finished our crackers and beef, and rode on at a steady gait.

About an hour before dark we saw a big valley ahead. The trail was very fresh; horse droppings not dry yet. We rode cautiously, Tom in the lead. At the last ridge he dismounted, crept on hands and knees to the top of the ridge and peeped over into an oval valley about half a mile long and a quarter broad. It was a sink hole about twenty feet deeper than the surrounding prairie and partially walled by a ledge of rock about ten feet high. There was a large pond in the center and the ground around it was worn bare by the constant use of animals, till it looked like a corral. Seven Indians were near the water cooking at a little fire, and the nine stolen horses and two Indian ponies were feeding about half way from us to them. Tom came back and we held a council of war. I was in favor of getting around to the edge about 200 yards from them and trying to kill them with a volley, but Tom was afraid that the survivors would get away with the horses and so we decided to all go over the ridge on horseback and make a charge. Three of us to go straight at the Indians and not shoot till we got close to them; and to do the shooting with our pistols; the other two meanwhile driving off all the horses. We tightened our girths, and suddenly it flashed through my mind what a fool I was to come out there to fight Indians, but it was too late. And here we went, well spread out, with a mad rush over the ridge and at them. They did not see us until too late. One ran a few steps toward the horses, two grabbed their guns and fired, but did not hit anything; and then we were almost on top of them, and were shooting as fast as we could; and they all ran through the water, making it fly, and up among the rocks and bushes on the east side, leaving their stuff scattered around. My horse ran into the water. I jumped off, went down on all fours and had a drinking match with my horse. Tom unslung his rifle and fired a shot or two while I drank, and then I filled my canteen, took my gun out of its scabbard and watched for something to shoot at while he was drinking, but did not see anything.

Tom picked up a needle gun and hung it on his saddle and smashed two or three old rimfire Winchesters. I took a good blanket that was lying by an old bug of an Indian saddle, and we started back as fast as our water-filled horses could carry us, followed by a few shots. When we had ridden about two hundred yards Tom looked back and said, "Hold my horse and I'll make that Comanche fellow stop that," only he didn't say fellow. The gentleman in question was lying on his back on a sloping rock, about four hundred yards away, with his heels in the air and making insulting gestures. Tom jumped down and shot. I saw a streak of dust fly off the rock about six inches to the right of Mr. Indian, and while he bounced off the rock and took to the brush we made tracks toward our retreating horse herd. When we caught up the boys were hurrying the horses along, still hobbled, with their ankles cut and bleeding. We stopped when we reached the outfit, caught fresh horses and turned our tired ones loose, unhobbled the rest, and by dark were ten miles away on the back track. After it was fully dark, so that no one could see our trail, we rode off the trail at right angles and camped two miles north, with a chew of tobacco for supper and the canteen dry; the boys had emptied it when I came to them, for they had not been able to get to water. I passed a miserable night, very thirsty, and more sick than hungry. We took turns standing guard.

At dawn we saddled and rode for home, a disconsolate-looking party. About five miles from water we rode past a buck antelope about 400 yards away. Tom told me to shoot him, but I was afraid I should miss, and proposed that four of us should get down and all shoot at once. We did so, and killed him "too dead to skin," as the Texan cowboys say. Every ball hit him. We rode out to him and got down, and some of the boys drank blood. It made me sick to think of it, but I ate a little piece of raw liver, and then we cut the carcass up and started for the water. We got there by 9 A. M., and how we drank! My tongue was swelled and my lips cracked and dry. The trip did not tell so badly on the others, as they were used to exposure and an outdoor life, and I was right out of a store. Tom cautioned me, and I only drank a little at a time. We built a fire of horse and cow chips, and broiled meat; some of the boys couldn't wait to much more than scorch it on the outside, and we all ate it rather rare and dirty, and with no salt; but it was filling. Away we went as soon as we could on the trail for home, all the time expecting to see a big gang of Indians after us.

At about 3 P. M. we reached the next water, cooked and ate more antelope, and just before dark started our weary horses for home—eighteen miles away—crossed the ford at about 10 P. M., and at 11 were eating *chile con huevas* (red pepper gravy with eggs dropped into it after frying them in lard), *tortillas* (Mexican bread) and some coffee, black and strong. Mr. Singer, strange to say, was in good spirits, and seemed as much at home as a tame cat. There was a Mexican lady at the ranch who was very handsome and quite friendly, and he had been giving her lessons in English.

I slept well on a big wool mattress, and the next morning Tom gave Singer $20 for forcible detention, me $20 for my employer and my pick of the two Indian ponies for myself. We all went up to the Plaza that evening. Tom and the rest, including Singer, got very full on Anheuser lager beer at fifty cents per bottle. I don't drink, and so the evening's entertainment was an awful bore to me.

When I got back to Anton Chico I sold the Indian pony to Mr. Monk, who keeps hotel, for $30, and the next week was back at the old job in Las Vegas with a good appetite, thanks to my excursion. W. J. DIXON.

COLORADO.

"WOODCRAFT."

THE little book "Woodcraft" has been received with such general favor and treated so leniently that I would not advert to the few critical exceptions only that they are calculated to mislead. I wish to be brief.

One writer criticises the light boots recommended on page 5 of "Woodcraft." He prefers shoes every time and always, because the boots will get wet and can't be drawn on and off. Quite right as regards the average boot usually bought of dealers; wrong as regards the boot I recommend. I have a pair of them on my feet as I write. This is the third season I have worn them. They have been worn on two rather rough cruises in the North Woods; have been waded in for nearly a day at a time through the muddy ditch called "Brown's Tract Road," where shoes would be a nuisance; have been worn on three trips down the Tiadatton the present season, where I was overboard a dozen times a day among the rapids, and they have never bothered me two minutes at a time in drawing on or off. They are waterproof at this time, and easy as a pair of moccasins. They weigh two pounds six ounces. Any competent bootmaker should be able to get up such a pair for $5 or $6.

Exception is taken to the hunting knives described on page 13 as being of too high temper, liable to "nick," and hard to sharpen. I did not and do not recommend high temper, but the best. And the best is the tough, tenacious steel that will hold a keen biting edge, without being hard or brittle. The strong double-blade shown in the cut does not come up to my idea of a pocket hunting-knife, but is the best I could find on sale. *En passant*, I have just received a lot of pocket hunting knives made after a model whittled out by myself. I have sent one to the hunting editor of FOREST AND STREAM, who, I presume, will be pleased to show it to any reader who takes an interest in camp kit, and I will only add that it pretty well represents my idea of a model pocket hunting knife.

Another writer takes exception to my directions for using baking powder (three tablespoonfuls to one quart of flour), and thinks it may be a printer's error. The directions are substantially correct—for the woods. Experience and experiment will prove to "Kelpie" that the quantity of baking powder which may be sufficient in a dry, warm kitchen, will have but little effect in the cool, damp atmosphere of the forest, particularly if there happens to be a brisk wind whiffling fitfully around the camp. I soon learned this, and came to think that the powders would not work well in out-door cooking. I found some old guides and woodsmen, however, who made good bread, and I was not long in picking up the "kink," which was simply, that the guides who used the powders most freely always had the lightest bread. Of course a good deal depends on the mixing, handling and baking. I was with a Brown's Tract guide in the summer of 1880, whose bread and pancakes were always light. I am loth to say how many tablespoonfuls he used to a quart of flour, much more than three, however. And he remarked that making bread in the woods was expensive, because the powders cost more than the flour.

Among the many newspaper notices of "Woodcraft," I note one in the New York *Evening Post*, wherein commendation and criticism are so neatly blended that I would not say a word were the criticism sound—which it is not. Firstly, the writer objects to the "general fishing rod," which, he says, "most people consider, and justly, a nuisance. Not good for bait-fishing and almost worthless for fly-fishing." If the writer will select the best eight or ten-ounce bait-rod he can find in New York, he will probably admit that it is "good for bait-fishing." Then let him add a good fly-tip, and if he cannot make it something more than "worthless for fly-fishing," I venture to suggest that the fault will be found somewhere near the butt of the rod.

Again, the writer says: "The description of the headlight, used almost entirely for shooting deer out of season, might have been omitted." Just so. The headlight being a most useful and handy article in a woodland camp, and the best light to float a deer in season, is to be "omitted" because a poacher may use it out of season. And the boat and the 10-bore, being necessary to float a deer in the hands of a law-abiding sportsman, had better be omitted, because they can be used as well by the poacher. A lame and impotent sort of logic. The witty allusion to the soap and towel, carried for seven weeks in the Wilderness without being once used, with the suggestion that "probably the portrait of 'Nessmuk,' which forms the frontispiece, was taken just before the seven weeks were up," are so neatly put that I will not say a word in explanation, especially as the writer concludes that "on the whole, the book is sound and practical, and well worth the reading." NESSMUK.

RESCUE OF THE GREELY PARTY.

THE International Geographical Congress at Hamburg, in 1879, adopted a scheme for the establishment of circumpolar stations for scientific observation in the Arctic regions. The location selected for the United States station was at Discovery Harbor, Lady Franklin Bay, in latitude 81° 45′ north, longitude 64° 45′ west. This was the most northerly and difficult of access of all the projected stations. Lieut. A. W. Greely, Fifth United States Cavalry, was appointed to the command, and on the Fourth of July, 1881, the colony left St. John, Newfoundland, in the steamship Proteus. The expedition opened most auspiciously. The Proteus found an open passage and made a run quick beyond parallel. Within one month from leaving port she reached her destination. On the day of their arrival the party killed fourteen musk oxen, which dressed 300 pounds each—three months' rations. The men set about building their house, which had been already prepared in this country, with its double frame—a house within a house; two years' stores of provisions were landed, and there were dogs and sledges, with Esquimau drivers, boats, and a steam launch and coal. With letters full of confidence and hope, written by Lieut. Greely and the others, and parting directions about the relief vessels which were to come in the summers of 1882 and 1883, the Proteus sailed away, Aug. 18, and left the Greely colony in their snug quarters at Discovery Harbor. According to arrangement, in 1882 and 1883 relief ships—the Neptune, the Proteus and the Yantic—set out to carry succor and supplies to the party, but, as is well known, they failed to accomplish their mission; and from the 12th day of August, 1881, until the wretched survivors were brought back to St. John, July 17, 1884, no word came of the fate of the Greely colony. Last Thursday the telegraph brought to us the news of their rescue, and a story of heroism, endurance, suffering and self-sacrifice well worthy to rank with the most thrilling chapters in the annals of Arctic exploration.

I.—CAMP CONGER.

They named the station Camp Conger in honor of the Michigan senator, who had been instrumental in securing the Government appropriation for the expedition. Scientific observations (meteorological, astronomical, magnetic, etc.) were begun immediately and continued while they were at the post. The long Arctic winter was necessarily monotonous, but the regular routine of observations coupled with such military discipline as was not inappropriate to the climate and the mode of living rendered it more tolerable. One hour's exercise daily was exacted of all. The men were required to bathe once a week, and great care was taken by frequent inspection to see that the quarters and particularly the berths were kept clean. The efficiency of the hygienic arrangements adopted is fully demonstrated by the fact that there was no scurvy in the expedition, notwithstanding that the water used was from melted ice invariably obtained from the floe. Thanksgiving and national holidays were always celebrated by a good dinner, and the first Christmas was rendered pleasant by presents for every member of the expedition from unknown but thoughtful friends.

Meanwhile they were making expeditions to explore the country in different directions, The number of dogs had been sadly reduced by sickness and death, but those left were carefully looked after and by breeding Lieut. Greely was able, in the spring of 1882, to put two good teams in the field. In nearly all of his explorations, as ever in Arctic expeditions, the dogs were found most useful and almost indispensable accessories.

These exploring trips were always attended with peril, often with great suffering. The men at one time, under Sergeant Brainard, experienced the lowest corrected mean temperature ever known in the annals of Arctic travel—viz., minus sixty-one degrees. On another trip by Dr. Pavy, Mr. Rice, with the Esquimau Jens Edwards, and a team of dogs; to discover land to the north of Cape Joseph Henry, Rice and Jens traveled fifty miles on foot in a temperature of—40°, without sleeping bag or tent, and later the party were adrift on an ice pack and driven miles from land, escaping as by a miracle over the grinding, crumbling ice.

Again, Lieut. Lockwood with Brainard and Frederick Christensen with a dog team, set out to explore the northern shore of Greenland, crossed the Polar Ocean direct to Cape Britannia, thence through regions never before trodden by man, to a point they named Lockwood Island, the highest northern latitude ever yet attained, 83° 24.5′, in longitude 40° 45′ west—and would have gone further yet, but that the long shadows of Arctic cliffs prevented a determining of the latitude, so their instruments failed them before their courage. They found animal life abundant with scant vegetation similar to that met with in Grinnell Land. Traces of hares, lemmings, ptarmigan and snow bunting, and the tracks of a bear were seen, and droppings of the musk ox as far as twenty miles north of Cape Britannia. Looking to the northeastward from an elevation of about two thousand feet, the land was seen for about fifteen miles, the furthest point, Cape Robert Lincoln, being in about latitude 83° 35′ and longitude 38° west. Although the weather was unusually clear, no other land could be seen, the horizon being examined carefully to the northward and northwestward. On the 15th they started south, picking up *en route* the union jack and sextant left by Lieut. Beaumont, of the Nares expedition, during his extraordinary retreat with a scurvy-stricken party in 1875, and returned to Fort Conger, where they arrived on June 1, after an absence of fifty-nine days, all in good condition except that two were snow blind and had to be led into camp.

During the season of 1882 Lieut. Greely made two journeys into the interior of Grinnell Land, leaving Fort Conger on April 23 and June 24 respectively. Winter quarters of Esquimaux were found and some relics showing that they had possessed dogs, sledges and iron. Two ranges of mountains running nearly parallel with the United States range were called respectively Conger and Garfield range, and a lofty peak, the highest in Grinnell Land, Mount Arthur. Of glaciers there were many, the largest of which was called Henrietta Nesmith Glacier. Great hardships were endured on the second of these journeys, when Greely and Linn, leaving the supporting party, traveled with packs, which weighed on starting about eighty pounds, fording and swimming many streams and being otherwise subjected to much exposure, without, however, any eventual ill resulting therefrom.

Game was abundant, more than one hundred musk oxen being seen, besides hares and birds. From the summit of Mount Arthur, Lieut. Greely, who was alone able to make the ascent, was satisfied from the trend of the mountains and the appearance of the country that Grinnell Land ended but a short distance to the westward, and that its coast line must run nearly southwest from the extreme point reached by Lieut. Aldrich, Royal Navy, in 1876. Later in August

THE POLAR BASIN.
(By permission of the "New York Herald.")

furnished, and this meant, in all probability, ultimate starvation. Lieut. Greely upon hearing their report announced that the party must abandon Esquimau Point, as he had named it, and transfer the camp to a place nearer the base of supplies.

A start was made on the next day, when one load of provisions was advanced as far as Rosse Bay, and on the 11th the remainder. They then traveled along a strait discovered by Rice, and named after him, which connects Rosse Bay with Buchanan Straits, placing Cape Sabine on an island instead of the mainland, as was formerly supposed. Rice and Jens having gone to Cape Isabella to ascertain whether any supplies had been left there last year, found only the 144 pounds of meat left there by the English in 1875.

The people had been on reduced rations since September 25, when the allowance of meat was made twelve ounces, and at Eskimo Point one-half that quantity. On the evening of October 15, they reached the Proteus wreck cache, with all their provisions except one load, which had been cached at Cocked Hat Island, and set to work on winter quarters.

III.—CAMP CLAY AT CAPE SABINE.

A hut was built of stones, roofed over with the whaleboat from the Beebe cache, the oars serving as rafters and covered with canvas, the sides being banked up with snow. Of course, there were no means of heating it, as barely fuel enough was left to warm the food. It was never cooked. On the ground canvas was spread and over this buffalo overcoats, on the top of which the sleeping bags were placed, and yet these were generally frozen stiff throughout the winter. The boat left by Beebe was in good condition, except for a hole about ten by six inches, made probably by the paw of a bear. As soon as the state of the ice permitted the stores from the different caches were collected at Camp Clay. These may be summed up as follows: viz., Beebe cache and English cache 240 rations each. In the latter considerable tea, sugar, chocolate, bread and dog biscuit unfit for use. The rum and alcohol were missing. Garlington cache, 500 pounds of bread, ninety of pemmican and a few cans each of roast mutton, peas, string beans, green corn and two boxes of lemons. These last were in excellent condition and proved a rare treat in more respects than one.

On the 2d of November a party was sent to Cape Isabella to secure the meat which had been found there. It was composed of Rice, Linn, Elison and Fredericks, with the small sled and several days' provisions. On the 9th, about midnight, Rice returned and reported the party at the head of Rosse Bay suffering severely with cold and Elison dying with frost bites. Relief was at once sent, and about noon of the 12th Brainard reached them in a severe gale with food and medicine, and found Elison badly frozen and delirious. Fredericks and Linn were in the sleeping bag with him trying to keep him warm, and the three were literally frozen in the bag, and had to be cut out. They would undoubtedly have perished but for Brainard's timely arrival, as the temperature was minus 30° Fahrenheit, and they were without a tent. With the assistance of a party under Lieut. Lockwood, which had also come to the rescue, they were gotten to Camp Clay. Elison having both hands and feet frozen stiff, so that he never used them again. They had been compelled to abandon the meat at Baird Inlet, with everything not absolutely necessary to save life.

During the latter part of October, Long, with the two natives, was stationed at the junction of Rice and Buchanan straits for the purpose of hunting, and suffered greatly with cold and hunger. They had only a tent to live in and were on reduced rations. They returned about November 8, badly frost bitten, having killed only three seals. From November 1 the command was placed on further reduced rations, which had been accurately estimated to last until March 1, with a reserve of ten days' full rations for the trip to Littleton Island when the sound should freeze over. This reduced ration was composed as follows: Meat and blubber, four and one-third ounces; bread and dog biscuit, six and one half; canned vegetables and rice, one and two-fifths; butter and lard, three-quarters; soups and beef extracts, nine-tenths; cloud berries, pickles, raisins and milk, one ounce; making a total of $14\frac{88}{100}$ ounces per day. About this time the whaleboat Narwhal, which had been left on the floe, drifted down near Cape Sabine and was wedged in the ice between Brevoort Island and the main land. She was secured and used during the winter for fuel. After the middle of November hunting became impossible on account of the darkness and cold, besides being useless, as there was no game to be had, so they waited patiently for the closing of the sound by ice, but waited in vain.

Throughout the entire winter open water separated them from Littleton Island, where there was an additional cache of provisions which, though not large, would have been sufficient, with economy, to pull the entire party through, and near at hand were natives on whom they might have relied for assistance, as did Kane and Hayes. Every effort was made to preserve cheerfulness in that little band, so necessary to its very existence. Conversations were kept up on all sorts of subjects, however frivolous, and they talked when they felt least like it, because they deemed it their duty. The few books that they had were read and re-read by the dim light of a blubber lamp with moss wicking, and a statistical almanac was a perfect mine of wealth. The survivors speak in the warmest terms of Greely's powers of conversation and the gallant efforts which he made to keep up the spirits of his little band. Notwithstanding their destitute condition, Thanksgiving and Christmas days were observed as usual. For more than a month they saved from their scanty rations in order that they might have, at least by contrast, a good dinner on those days. It consisted principally of rice pudding, with a glass of rum punch to wash it down. March 13, 1884, Long was sent with Frederick and Jens to Alexandra Harbor to look for game, the English expedition of 1875 having reported abundant traces in that quarter. They returned exhausted, however, after an absence of three or four days and empty-handed. Long, however, had made the important discovery of new land in Hazen Sound, having seen from the western side of Mount Carri three capes beyond the furthest reported by the Nares expedition.

The life at Camp Clay during that terrible winter and spring is simply indescribable. Rice discovered salt shrimps, with which they eked out their suppers, but they contained very little nutriment, and the labor of catching them may be imagined when it is known that it required 1,300 to fill a gill measure. This fishing was done by hauling bags or nets from the ice with bare hands and with the temperature 20° below zero. The suffering entailed was tremendous. Lichens gathered from the rocks, saxifrage and boiled sealskin were also eaten. Twenty-four foxes, weighing about

four pounds each, were killed with shotguns as they prowled around the camp, and with the return of daylight fourteen ptarmigan, sixty dovekies, a small seal and, in April, a bear which netted them 257 pounds of good meat. Nothing was wasted, and this last undoubtedly saved the lives of the few who survived. Sergt. Brainard had charge of the issue of provisions, which were carefully weighed in an improvised scale, cartridges serving as weights, and equitably distributed. In March it was found necessary to again reduce the ration, there being nothing left then but bread, meat and tea.

The first death was that of Sergt Cross, who had been the machinist of the steam launch, and then there was a long lapse of time until Esquimau Frederick gave in. This last, together with the death of the other Esquimau, Jens Edward, by drowning, proved a serious loss, as they were both good hunters, and without the kyak much of the game that was killed could not be secured. Long, however, was the main reliance of the party as a hunter. He is an old frontiersman and a dead shot. Had it not been for the scarcity of game he would have had no difficulty in providing for the entire party.

Sergt. Julius R. Frederick relates a mournfully tragic story of the sad death on the ice-covered ground of George Rice, the artist of the expedition, on April 6. Rice and Frederick volunteered to leave the camp to proceed a distance of twenty-five miles for some meat that was cached near Cape Isabella. They had a sled, rifle and hatchet, and provisions for five days. They traveled for three days, but failed to find the cache. On the way toward their camp Rice became weak, and finally gave up. He was attacked by a blood flux that gradually wore him down, and he succumbed on the floe. His last words were: "Tell Lieut. Greely that I tried very hard to get the meat, but could not succeed." Frederick remained with Rice until he died, and camped out that night under the fragment of a boat, and next day revisited his companion to pay a last tribute to his remains. Frederick retained sufficient strength to drag back the sled, with the hatchet, rifle and cooking utensils, to the camp. During his absence Cross and Lockwood had died. Others followed in rapid succession.

On May 4 the winter hut, which was only six feet from high water mark, was abandoned, and the party took up their quarters in a wall tent further up the hill.

On May 14, the last issue of provisions was made. This consisted of six ounces of meat, everything else being exhausted. Some ate it at once, others hoarded it as long as possible. Then some lived and some perished on a starvation diet of seaweed, shrimp and lichens.

The rest is heartrending. They burned the hair off their sealskin boots and coats, cut them into strips, boiled them into a stew and ate voraciously of them till the stomach rebelled, and nausea and weakness ensued in several cases. Nature gave no call for twelve, fifteen and eighteen days, and then bloody hemorrhage and consequent weakness ensued, prostrating the victims for several days. The difficulty of keeping heat in the body was very great. The rule of the camp was to permit no one to sleep longer than two hours. He was awakened roughly and called upon to shake himself, beat his hands and pound his feet and restore circulation. This was found absolutely necessary to prevent torpor and possible death, the usual accompaniments of intense cold.

Mr. Israel, the astronomer, perished on May 27, Lieut. Kislingbury died on June 1, and Dr. Pavy, the naturalist, slept into death on June 6. Not one of the victims realized that death was near. They all died a tranquil, painless death. On June 18, Schneider, the nineteenth man, died.

Of the twenty-five only seven were left: Lieut. Greely, Sergt. Brainard, Sergt. Fredericks, Sergt. Long, Hospital Steward Biederbeck, Private Connell, and Sergt. Ellison. Finally all strength failed them. On the 22d of June the tent blew down upon them and they did not attempt to raise it. The seven starved wretches lay helpless beneath its folds, waiting for death to end their terrible agony.

IV.—THE RESCUE.

But succor was at hand. The relief ships sent out from New York in May, were breaking their way through the ice, and making all speed to Cape Sabine. On the 22d of June the Thetis and the Bear lay off the shore, while their crews were exploring the land for traces of the Greely party. The Thetis whistled to her boats. The half-conscious men in the tent heard it. Sergeant Long and Sergeant Brainard were the first to hear the sound, and they helped each other to crawl out of the tent. When Long got clear of the entanglement of the tent, which had been swept to the ground, he rose to his feet with great difficulty and succeeded in clambering up to a rock that gave the most extensive view in that neighborhood. Intervening hills hid the ships from their view and they returned disappointed with their melancholy report. Brainard says this was the bitterest moment of his life, and that he then gave up all as lost. Long, not yet fully satisfied, went out again, and climbing to the hill top remained looking out searchingly in every direction for some strange object. At length he saw an unwonted sight—a large, black object about a mile distant, which at first looked like a rock, but he knew there was no rock in that line. Suddenly the approaching steam launch changed its course, and Long recognized the approach of rescuers. He came down from the rock, went toward the camp, raised the flagpole and flag, which had been blown down during the gale, and held it for about two minutes, until his strength gave out, and it was blown once more to the ground. He then advanced totteringly in the direction of the little steamer, and, too overjoyed to control himself, almost too weak to stand, he tumbled rather than ran down the hill to meet his rescuers, and was the first of the party to arrive on board the ship.

Norman, the ice pilot of the Thetis, who was mate of the Proteus in 1881, and the last person to say good-bye to Greely at Lady Franklin Bay, was also the first to greet him here, having accompanied Lieut. Colwell was in the Bear's steam launch, and being the first to arrive at the camp he jumped ashore at once. Upon landing, with his pockets full of bread, he heard from Long the melancholy news that there were but seven left, and knowing that Greely was one of them he ran up the hill to within hailing distance and called out, "You are all right, Greely; there are two ships here for you." Greely recognizing the voice replied: "Is that you, Norman? Cut the tent."

Maurice Connell had no recollection of anything that transpired. He did not hear the awakening scream of the whistle. When his comrades shook him up from his prostrate position in the camp and told him of succor at hand he wildly exclaimed, "For God's sake let me die in peace!" A teaspoonful of brandy applied to his lips called back the fleeting life spark, for Connell could not have survived more than a few hours. He was by far the weakest of the seven survivors, and the strongest must have succumbed within forty-eight hours.

Ellison, who, because of his frost-bitten hands and feet had not moved all winter, would have lived longest without rescue, as his subsistence was provided for. A water bag filled, which he could open with his teeth, had been placed at his head, all spare food was at his side, and upon the stump of one arm a spoon was fixed to carry food to his mouth. He was taken on board the Bear, and his limbs amputated. He went mad with the agony and died.

The rescue took place under circumstance of great difficulty. The Thetis and Bear lay off from the shore about 300 yards. There was a terrific gale blowing from the southwest, a heavy sea was running, and a formidable ice nip was apparently inevitable. Lieut. Greely and the other six survivors had to be transferred from their camp to the steam launch and whaleboat in their sleeping bags, and while steaming from the land to the ships the destruction of the whole party at one time seemed certain. The sea swept furiously over them, and the fury of the wind threatened at every instant to capsize them. At length they were safely placed on board the rescuing squadron, where every possible preparation had been made to insure their recovery and comfort. Then the rescuers went back to the graves—ten of them—on the hill, and brought thence the bodies of the dead. Five bodies buried in the ice fort near the camp were swept away to sea by winds and currents and could not be recovered.

Then the ships turned southward, and on July 17, with the six survivors, steamed into St. John, Newfoundland.

Natural History.

THE GROUND SNAKE.

According to the Bridgeport (Conn.) *Farmer* there is, in a collection of curiosities in that city, what is called a ground snake, which was caught in Hawleyville. Only one is known ever to have been seen before. It is quite similar to the ordinary snake, but cannot be induced to withdraw from the loose earth in which it is kept. Whenever uncovered it makes haste to bury itself again.—*Boston Journal.*

THIS brings up an article written years ago, and which, like the snake and many other things in my possession, has been waiting for some circumstance—some jog on my constitutional indolence—to bring it out. I have had four of these reptiles; two are in my possession at present. The first was brought from Enfield, Conn., twenty years ago, thrown out while digging fish-worms, and said to "run" under ground. I looked the creature over to see what modification of form and what power of locomotion would be necessary in this new arrangement of animal economy, it being at once apparent that running under ground was a different matter from running on it. I then pickled the specimen and awaited further light. The second was turned out by the plough in Agawam, Mass., and brought me without note or comment. The third was hoed out in his garden by my old and tried friend, J. H. Batty, whose contributions to natural history speak for themselves. He represented the snake as very active, striking out at random and quickly burying his body in the soft earth, and with true philosophy coiling his tail around a stick or other object and pushing from that base. Color, a light brown above, white below, the entire length. The body, some eight inches long, is as round as if turned in a lathe, the tissue hard and compact beyond any reptile I ever handled. The broad, flattened, angular head and the narrow neck of solar reptiles is entirely wanting. The body tapers down to an ovate termination with a very small mouth, incapable of distention, and with a pair of eyes of doubtful utility crowded close upon it.

Here is evidently room for research. I preserved the first specimen for future reference and comparison as corroborative facts should arise. These have now brought up philosophic questions which must be met and answered, else our children, old as well as young, will miss intelligence just where they need it most.

Is the creature sightless, as striking at random seems to indicate? The eyes of mine changed to white opaque in alcohol, which prevented microscopic examination. Does the creature breathe, or does it draw oxygen from other sources? Is locomotion by the usual method of reptiles, by short curves, pushing from every object it touches, or is it like the worm, drawing the body together and from that base pushing its head forward? The snake method above ground would hardly work below the surface, nor would the worm method do better, except by modification or absence of the spinal column, and yet for which the firm, muscular body might in a measure compensate.

The question is not when was the reptile created, not who first saw one, nor yet who first counted the scales on his tail, if he had scales; but, does he or does he not hold the position of connecting link between two great orders in lower organic life, partaking of both? If he does, as I am ready to believe, we have one of those (not the missing link in evolution, as commonly understood) but connecting links of harmony and continuity in nature, an overlapping of the functions of life which, like that of instinct and mind, leave no break in the chain, no point unoccupied.

But this is not the only illustration of the question. I have in mind a vegetable which seems actually to possess the instinct of the eyeless worm and to unite the animal and vegetable by a shorter route than any usually followed. Not springing from the earth at all but uncoiling, precisely like the embryo serpent from the egg, then, from a club foot as a base, thrusting the head forward to an object, then drawing up the body left behind. The consideration of these connecting links in organic life, and over which science blunders with hybrids and crossings in the dark passages, require another paper. They are no part of nature's work. They are pure accident, or a human device and belong exclusively to artificial or domesticated life.

It is hardly necessary to say there is very little at present known in regard to this snake. My purpose is to submit one of my specimens to the mercies of microscope and dissecting knife on my return to Springfield. Presuming on its habits or food is hardly safe until that is done. B. HORSFORD.

NORTH THETFORD, Vt.

[Is not this the ground or worm snake (*Carphophiops amœna*)—a true ophidian? Information as to its habits is greatly to be desired.]

FISHING SPIDERS.—Prof. Berg, in Buenos Ayres, has discovered a spider which at times practices fishing. In shallow places it spins between stones a two-winged or conical net, on with it runs in the water and captures small fish, tadpoles, etc. That it understands its trade well is shown by the numerous shrivelled skins of the little eel pouts which lie about on the web of the net.—*Deutsche Fischerei Zeitung.*

A VISIT TO A HERONRY.

SEVERAL years ago the writer, who at that time was an ardent student of ornithology, heard of a tract of forest on the shores of Massachusetts, in which a colony of night herons (*Nyctiardea gardeni*) had bred for may years. Procuring a team, we started with a companion for the place, which was located in the township of Rawley. This town is situated on the Rowley River, a small stream, and about two miles back from the coast. Between the town and the sea is a strip of salt marsh extending for miles and intersected by numerous small inlets and ditches of varying depth, according to the state of the tide.

About two miles north of the town we found a strip of forest perhaps a mile long and a half mile wide on the edge of the marsh before mentioned. Above this piece of woods herons could be seen flying back and forth, so that we knew that this must be the place we were in search of. At a farm house near by we put up our horse and proceeded to the grove. As we reached it a most interesting sight presented itself. The trees were mostly of the beech variety, forty to fifty feet tall, with a smooth bark and not a limb projecting in the first thirty feet; then would come a few dead limbs, killed and stained white by the excrement of the birds, and followed by the live limbs, on which were heron's nests. These birds are gregarious, and a half a dozen families build in a single tree. Almost every tree in the grove had from one to six nests in it, and as it was hatching time, the noise made by both old and young birds was deafening. This heron is a lazy bird and does not believe in taking any chances in constructing his dwelling place. Therefore he builds but a small nest to start with, just large enough for the four eggs, and as each young one hatches out, he builds on an L, large enough to hold it, so that if an egg fails to hatch, no labor has been done in vain. Above our heads were nests of all sizes and shapes, and those to which additions had been made, were very one sided, and on the platform thus constructed could be seen an awkward squab trying to keep his balance.

Some nests had four young ones sitting on the edge. These were of enormous size, made of sticks thrown together in the most careless manner and were very clumsy-looking affairs.

Occasionally a tree with but one nest could be seen, and these were generally those of the green heron (*Butorides virescens*), who lived thus with his cousins. The uproar in this grove was simply frightful. Young birds squawking for food in every direction, old ones on the nest and at the side of it, and others departing for the shore and creeks to fish, and arriving from these places with fish in their mouths, their arrival was greeted with much enthusiasm. Our presence surprised these new comers so much that they must needs exclaim about it, and in so doing they would drop the fish which they were carrying in their mouths, letting it fall at our feet. It is a little singular that a bird which displays so much shrewdness in its nest building, should be so foolish as not to pick up a fish it had dropped; but such was the case, and the birds would turn immediately about and go back for another. The condition of the ground from this cause and the ordure of so many large birds can be well imagined. A more filthy or odorous place it would be hard to find, and the deposit of lime made there had killed nearly every species of vegetation. Mosquitoes of large size and ferocity abounded, and our stay there was not a happy one. We made several attempts to climb the trees to nests that looked as if they still had eggs in them (for it was early July), but the slippery bark and the distance the limbs were from the ground made our attempts futile. Each of us, aided by boosts from his companion, would climb within a few feet of the limbs, when his strength would give out, and down he would slide, landing with much bunched up clothing and scratched arms and legs. After a number of attempts with the same results, we decided that we could not (although we considered ourselves experts) climb those trees, and we sadly wended our way back to the farmhouse to get our horse. Arriving there, we related our ill luck to the farmer, when he said: "Wall, my darter was out thar the other day, and she clim' up and got some eggs, and ma'hap she'll sell 'em." We asked to see her, when a buxom six-foot daughter showed herself. We looked at her and acknowledged to ourselves that she was smarter than we were, as she could shin those slippery trees and we couldn't. She had four light green eggs for sale, and we asked her the price. "Well," she said, "would we think ten cents for the four too much?" We eagerly replied that we would not (we would have given her a dollar as quickly), and took them, feeling that we had secured a prize, and unwilling to say a word against the tree-climbing qualities of the Rowley women. After a long and hot drive we reached home.

A year later we again visited this heronry, and it was as silent as a tomb. The quabirds, after breeding in this spot for twenty years or more, had taken alarm at something, and gone, probably to a more remote and less disturbed locality. CURTIS.

DOMESTICATING QUAIL.

Editor Forest and Stream:

My pair of Virginia quail are in excellent health and plumage. June 29 I first saw unmistakable indications that they had mated. On the 10th of the present month the pair went to work building a nest in the long grass of their coop, the floor of which is the natural sod. Bob, the male bird, seemed to take principal charge and direction of the work, although Betty's interest increased very perceptibly after the first day or two. On the 16th (last Wednesday) the hen laid the first egg, and to-day (July 19) the nest contains three, all of which seem perfect in every respect. Perhaps you can guess how much I am pleased with my prospects of success in this most interesting experiment.

I propose to let the birds entirely alone, so far as any outside aid or interference is concerned, since I am confident that they will hatch a larger percentage of the eggs than if they were removed and placed under a common fowl or even a bantam. So far, I have never touched the eggs on the nest, but the birds show a singular absence of fear or distrust when I go into the coop, which I have been in the habit of doing once or twice a day for some time. Since she has begun to lay, the hen makes a point after I visit the coop to go immediately to the nest, as if to satisfy herself that nothing has been taken, and both the birds, instead of attempting to conceal the nest or distract attention from it, appear quite proud of their achievements.

My coop, which is 16 feet long by 8½ feet wide and 4 feet high, is both cat proof and rat proof. In other words, it cannot be climbed, burrowed under or gnawed into, and hence the chances of accident are reduced to a minimum. I shall be greatly disappointed if I do not have a bevy of

young chicks in August, hatched by the parent birds themselves, and I hope to be more fortunate than my friend Willis last August. He succeeded in saving only the "old man," but I confidently count on saving the mother and all the family. J. B. B.

TOLEDO, Ohio, July 19, 1884.

AN AMPHIBIOUS INSECT.

I WAS lying for ducks one evening in a Kansas cornfield. We had been having heavy rains and a portion of the field was submerged. I had taken my position as close to the water as the soft ground would permit. After getting settled so that I could give heed to sights and sounds, I became conscious of a peculiar noise, which I at first attributed to the splash of rain on the dry stalks of the standing corn, but as it was not raining I was soon convinced I must look to other causes for the phenomenon. In a little while my attention was attracted to an insect, whose gyrations greatly excited my curiosity. There were numbers of them, and an individual would rise in an irregular spiral to a height of twenty or thirty feet, doing it in a strong, bold, aggressive manner, and then when at that height would turn and plunge downward with the speed of a bullet, some impinging on the corn would produce the noise spoken of, others falling clear would strike the water and disappear instantly, a little swirl on the surface being the only indication of their disappearance. As well as I could observe, the creature appeared to be about an inch and a half in length, shaped generally like a beetle, with two plumes projecting from the head.

I have watched fishhawks and terns by the hour drop from a height on to the water, but here was an insect equally at home in the air and yet would dive under water and remain I know not how long. None of the sportsmen of the locality had noticed their peculiarity, and in none of the works on entomology that I have seen could I identify the insect. What was it? R. K. B.

[It would be impossible to determine from your description what the insects were. Very probably they were beetles, of which many species are aquatic. The families *Dytiscidæ, Gyrinidæ, Hydrophilidæ*, and others, spend most of their time in the water; or, it may have been one of the larger *Hemiptera*, many of which live in the water.]

HOW TURTLES DIG THEIR HOLES.—In an article in FOREST AND STREAM of July 10, entitled "A Tough Turtle," written by M. M. Benschoter, the question is asked if any of your readers ever noticed the manner in which turtles dig the holes in the ground in which they deposit their eggs. Yes. A case of this kind came under my observation while a mere lad, living in Kentucky. I was plowing corn in a field near which ran a creek of considerable size, and on going to a famous spring near its margin I saw a turtle upon the bank about fifteen feet above the water. It appeared to be awfully busy about something, and as I was in no haste to return to my plow I stopped and watched it for a while. I soon saw it was digging a hole in the hard, dry ground, not having noticed me; but what surprised me most was the fact that it moistened the earth with what I then thought was its own urine, repeating the moistening process as often as it became necessary to soften up the earth. When I thought it time for me to get back to my work I drove the turtle away by approaching closer, when it clumsily crawled down the bank and rolled into the creek. The dirt excavated from the hole was simply mud, while the earth thereabouts was dry as powder. I have always believed that turtle expedited its labors in the manner mentioned, though it may be that the water used was carried in the mouth. At all events, it drew its supply of water from its own tank.—BURR H. POLK (Lincoln, Neb.).

STRANGE ANTICS OF AN OWL.—Mr. J. Willard Schultz, author of the very interesting series of letters on the Blackfeet Indians recently published in FOREST AND STREAM, writes me from his ranch in Northern Montana that he "saw a very queer thing this spring," and goes on to say: "It was nearly sunset. An owl flew down into my garden and after hooting a few times flew up and slowly rose to a height of several hundred feet, his great wings flapping so slowly that by actual count they about kept time with the beat of my pulse. Suddenly he dropped swiftly toward the earth, and as he came he beat his wings together in front of his breast, making a sound like the rattle of a pair of bone clappers. It seemed as if merely the tips of his wings touched, and when he was doing it he was descending very rapidly. He kept the performance up at intervals until it was so dark I could see him no longer." Judging from a rough sketch inclosed by Mr. Shultz, the species seems to have been the great-horned owl (*Bubo virginianus*).—C. HART MERRIAM, M. D. (Locust Grove, N. Y.).

DONATIONS REQUESTED.—*Editor Forest and Stream:* I am making collections for all departments of the museum of Chaddock College, located here at Quincy, Ill. I am not being paid a penny for my time, or for the specimens placed in the collection. This much by way of preface. Among the readers of FOREST AND STREAM are very many lovers of nature who are constantly gathering from woods and rivers and lakes things that would be of great value in a museum. I have wondered if among the generous-hearted there could not be found some to help me in my work. I wish I could offer them pay for specimens, but I cannot. If any of them can send fossil, or shell, or snake, or bird, or fish, or skeleton, or horn, or antiquity, or other specimen, I will gladly attach their name to it as the donor on placing it in the museum.—RICHARD G. HOBBS (Quinby, Ill., July 11).

QUAIL'S FLIGHT AGAINST A HOUSE.—Pittsburgh, Pa., July 19.—One day in the summer of 1877, when I was living in Columbiana county, O., we were startled at our midday meal by a sharp bang against the side of the house, as if some one had thrown a brick against it. I rushed out to see what was the cause of the racket, and just as I turned the corner I saw a hawk turn abruptly in his flight away from the house. Looking at the end of the house I saw a full-grown quail sticking up against it. The quail had flown with such force in its vain endeavor to save its life that it sprung the weather boards enough to allow the feathers on the breast to pass in between them and pinion it fast in death.—S. C. G.

THE SEWAGE QUESTION.—Professor—What is a sewer? Student—A course for liquid refuse. Professor—What kind of refuse? Student—All imaginable kinds from dwellings and factories. Professor—Good; give an example. Student—The Schuylkill River.—*Philadelphia Exchange.*

Game Bag and Gun.

SUMMER WOODCOCK SHOOTING.

THE July noonday swoons with heat,
Yet pleasant is the wood's retreat,
For there the drooping branches spread,
A chequer'd umbrage overhead.

Where scarce the sun-spears, quivering bright,
May pierce the foliage with their light,
Ah! There so shadowy sleeps the wood,
Where hermit woodcock seek their food,

(Piercing with bill the oozy edge
Of stream, where bends the water-sedge)
That well the gunner may invade,
The cool recesses of the shade.

The alders there weave densest screen,
The willows lift their shields of green;
The woodbine twines its glossy crown,
The grapevine drops its garlands down.

There coppice thick, and thicket dense
That hem the brook with thorny fence,
Unite their verdurous shades to greet,
In woodcock haunts, the sportsman's feet.

Turn gunner then from harvest vale,
From wheat fields haunted by the quail,
For not yet may the gun molest
The bevies of the quail in nest.

Spare thou those russet-plumag'd flocks,
Till ripen'd corn is heap'd in shocks,
And all the sumptuous golden grain
Is garner'd from the harvest plain.

For then in sharp October days,
The quail-flock thro' the stubble strays;
And pealing shot and smoking gun
Will boast of ample triumphs won.

But rather seek the plashy swale,
Low in the moist and boggy vale,
Or pass thro' bushy swamps that hide
With briery hedge the brooklet side.

These shy, secluded birds, all day
In cool, thick-shaded haunts delay;
But when the woods at eve are dim,
To open feeding grounds they skim.

They bore for larvæ in the soil,
Or marsh worms, with a greedy toil;
Loving in spring time to arise
In spiral circles to the skies;
But ever 'tis a welcome mark
In open glade or woodland dark.

GREENPORT, L. I., July 18. ISAAC MCLELLAN.

OPEN SEASONS FOR GAME AND FISH.

REVISED TO JULY 17, 1884.

Minnesota.

Woodcock, July 4-Nov. 1. Pinnated and sharptail grouse. Aug. 15-Oct. 1. Quail, pheasant or partridge; Oct. 1-Jan 1. Ducks and geese, Sept. 1-May 15. Deer and elk, Dec. 1-Dec. 15, (may be had in possession to Jan. 1.)

Exportation from State or possession for purpose of exportation is unlawful. The Minnesota State Sportsmen's Association (W. S. Timberlake, Secretary, St. Paul) offers $25 reward for information leading to conviction.

Mississippi.

Ruffed grouse, quail and wild turkey, Oct 1-May 1. Deer, Sept. 15-March 1. Meadow lark, Sept. 15-March 1.

Deer and wild turkey law repealed in counties of Clark, Simpson, Smith, Covington, Greene, Wayne, Perry, Calhoun and Newton.

A WORD FOR THE OLD GUN.

Editor Forest and Stream:

When a sportsman of the present day contemplates his gun, he is glad he did not live and shoot in the "good old times." When he goes shooting his feelings are very apt to be reversed. In other words, we have an advantage in weapons, equipment, etc., over our fathers; but the general decrease of game within, say, forty years far more than balances the account. I, for one, would gladly go back to the muzzleloading gun, if I could then find three birds where I now find two. Of course this is out of the question, and, of course, I do not expect to permanently abandon the breechloader until, from necessity, I lay aside all firearms. I may abandon it temporarily; as, for example, if I should receive an invitation (now quite unexpected) to shoot with some veteran and conservative sportsman, who "allows no breechloaders" on his island. And in some other contingencies I may take for a time to the muzzleloader.

Still, although I shall do most, if not all, of the shooting that remains to me with the modern gun, I don't feel that going back to the old muzzleloader would be in itself a dreadful calamity. The pleasure of shooting would not be for me materially diminished. To illustrate, suppose two men, A and B, both being equally good shots, start out for a day's quail shooting. A carries a muzzleloader which, thirty years ago, was much admired, and is still in good order. B uses a well-made breechloader with the modern improvements, rebounding locks, pistol grip, snap fore end, etc. Now what will the result be? If A is a careless man, he will be more likely to shoot himself than will the equally careless B. A's hands will probably be grimed with powder dirt, more or less, before the day is over. If at night each party cleans his own gun, A's work will not be quite so easily done as B's. If they do not shoot together B may get over a little more ground than A, but the latter can go over enough to satisfy a reasonable man who is out for a day's pleasure, and not on a "go as you please" walking match. So B has some unquestionable advantages, but after all, luck being equal, A will bring home just about as many birds as he will. If his gun is a full choke, A will probably beat him, unless the parties shoot with uncommon precision, and in that case, A's birds will be in better order—not so much riddled with shot. Possibly A will lose a shot or two in the course of the day from not being able to load quickly enough. But this is not very likely to happen in quail shooting. I have heard of a flight of woodcock coming to a given point in such quick succession that a muzzleloader would not meet the emergency, but I have never had the luck to see anything of the kind. Leaving such extraordinary cases out of consideration, A's chances for game will be just about as good as B's.

In duck shooting the conditions are somewhat different. There, I suppose, the breechloading chokebore has a great advantage over the muzzleloading cylinder.

There is one point worth considering in favor of the old-fashioned gun, viz., the effect on the dog. When muzzleloaders were used, it was a necessity to have the dog drop to shot and remain steady at the "down charge" while the gun was being loaded. Now, a pause of a moment is all that is required, and I suspect the change is responsible not only for a good deal of "breaking shot," but also for some unsteadiness in pointing and backing. I do not speak from my own experience on this point, but should like to know what the veteran sportsmen think of the theory. I have enough faith in it so that if I ever again have a young dog to handle I shall be tempted to shoot over him the first season with a muzzleloader, and to brave the scorn and pity I may thus incur.

If any man who has an old-fashioned double barrel gun that serves him well, cannot afford a good breechloader, let him possess his soul in patience and stick to the old gun. Especially, let him not trade it for a single barrel breechloader, unless, perhaps for duck shooting. A heavy single gun is no mean weapon in that sport. But in the field I value the second shot to send after the flying bird more than all the "modern improvements."

I believe the introduction of breechloaders is not in any great degree responsible for the great decrease of game which has taken place within the memory of middle-aged men. I think so because I have shot in company with muzzleloaders that did much more than their even share of destruction. The principal causes of this decrease are: First, the snare; second, the tenfold multiplication of sportsmen; and third, the lax enforcement of the laws. PICKET.

RELOADING AMMUNITION.

Editor Forest and Stream:

It being so perfectly evident to me from what has been thus far written, particularly by the opponents of the repeater, that proper care is not exercised by riflemen in the selection and reloading of their ammunition, and their own faults being afterward laid upon the guns, perhaps it may be of interest to the many if I call attention to the various styles of cartridges, or more properly speaking cartridge shells, and give the method of loading followed by the army.

To begin with shells, the main point of importance to the rifleman is in the character of the "head," and the kind and quality of the material from which the shells are made. The head should always be of the solid form for long use, those with folded heads having but short life and being mainly intended for army use, to be thrown away after their first shot, and not to be kept for reloading. Folded interior-primed shells cannot be reprimed readily, and are not intended for such reloading, so they can be omitted from further mention. Folded exterior-primed shells can be reprimed and reloaded, but they are weak and dangerous from liability to rupture under the folded head when used any number of times, and although cheaper at first cost than the solid heads, they are the most expensive in the end, and their use should never be depended upon. We thus have the "solid head" form as the best for constant use, and the next point to consider is the character of the "seat" or "cup" prepared to take the primer.

There are several different styles, going by various names, and all good for the first fire, but some are better than others, and as we are looking for the best, let us see which they are, and the reasons.

It may be taken as an axiom in all matter pertaining to arms and ammunition that the best is that which is the simplest, provided strength and durability has not been sacrificed to simplicity. This rule, therefore, excludes all forms of shells with movable anvils, or removable heads, as they want simplicity and have no additional elements of strength or safety over those that are more simple. I have forgotten the names of these two forms of shells, but I have used them and know from experience that they are only a nuisance.

Coming then to shells without movable anvils, and with non-detachable heads, we have first the "Lowell" shell, and my objection to this is that the pocket for the primer is too small and not deep enough, and I have never succeeded in re-seating primers as they should be seated in this shell. The face of the primer cannot be seated deep enough beneath the face of the shell head, and it is, therefore, too liable to accidental explosion. The Lowell shell is made purposely to hold the primer very tightly, and a great deal of force is needed to seat the primer, causing a good deal of loss from primers prematurely exploding while being set. This form of shell was the first form of reloading shell furnished to our troops, and its use had to be abandoned for want of satisfaction, and the difficulty of setting the primers. I have had shot after shot accidentally fired from the face of the breech block striking against the exposed primer on closing the gun, and this, too, when care was exercised, from the fact of the primers being exposed being known, and I have had to abandon entirely the use of those shells.

Then we have the "Berdan" shell, the form made by the Bridgeport Company, and this shell strikes me as defective, inasmuch as it requires a special tool with which to extract the primers. The pocket has three vents to allow the passage of the flame from the primer to the powder, and a raised conical anvil in the center of the bottom of the pocket, on which the primer is exploded. Besides the difficulty of removing the primers,* this "anvil," being of brass, is easily battered down by repeated blows of the firing pin, causing frequent misfires, as the shell becomes old, from frequent reloading, and rendering it unserviceable long before the "life" of the shell itself has become exhausted. I have just cut open one of these shells and found it to be with folded head, although I think that they are also made with solid head. Of a lot that I bought for Winchester shells, there being no mark on the box; as soon as I learned that they were Berdan, I laid them away, and have never used or intend to use them the second time.

There is another form made by the Bridgeport Company, and stamped U. M. C. Co. on its rear face, which is much preferable. This shell has a solid head, and a central vent to the pocket, and is primed with a primer which con-

* I have never yet seen a tool that gave satisfaction in removing primers from shells that had no central vent. The "Bridgeport tool," furnished us to extract primers from Berdan shells, is simply worthless, and the tools made by the Remington Company for their "steel-coned" shells is but little better. The shells and anvils will become damaged by the awl or chisel cutting through, or slipping off of the primer in spite of the care that may be exercised.

tains its own anvil. The main objection to the shells, however, is the fact that the pocket does not receive the primer deep enough (as explained for the Lowell shell) and like this latter, is too thin in the flange, so that the extractor is liable to cut through in trying to extract a swelled shell, or one that hangs in the chamber from any cause.

The Winchester and Frankford strike me as the best shells for general and continuous use. The heads are solid and heavy, there is a central vent to the pocket, so that the primer can be driven out of the discharged shells with the simplest of tools and the greatest ease, and the pocket is deep enough to allow the primer to be seated deeply, and away below the rear face of the shell. There probably are folded-headed shells made by the Winchester Company, but all that I have in my possession are of the solid head form.

In buying shells it therefore strikes me that the rifleman should be careful and look for certain points and exact that his shells should comply therewith. He should call for exterior-primed, solid-headed shells, with deep pocket for primer, and with one central vent for the flame.

As to material, there is yet no settled opinion, some claiming that high brass makes the best, others that a composition called "gilding metal" possesses superior advantages. Those made for the trade are generally of fine brass, those made by the Government of gilding metal or copper. My experience is—and I have used all kinds—that those of fine brass have the longest life, and will stand heavier charges of powder and a greater number of reloadings.

But with the best shells in the world one cannot succeed without proper reloading tools with which to do his work of reloading, and this leads me to this subject. I have looked and looked and looked in vain to try and find such reloading tools in the market and for sale by the trade. Various styles of so-called reloading tools are to be found, but they do not satisfy all the conditions requisite for success; and I can find no tools outside of those supplied by the Government that will do their work properly. Let us examine some of the tools to be had in the market, and from this examination see what is lacking.

The Marlin Company advertises "reloading implements for all sizes Ballard and Marlin cartridges," comprising bullet-mould for either grooved or patched balls, ball-seater, re-capper and de-capper, powder scoop, wad-cutter, wood mallet, and swage for bullets. Very good, so far as it goes; but where is the resizing or crimping die? They also advertise a combination tool that they claim to de-cap and re-cap, seat the ball, and crimp at the same time (a thing that cannot be done properly in one motion with certainty), and this tool, it will be observed, does not resize the shell. The Winchester Arms Company also advertise reloading tool sets, but they are not complete, and will not give complete satisfaction. In 1876–77 I had a set of reloading tools for the Sharps .44-90 rifle and could do nothing with it, as there was no resizing or reloading die, and I found that my shells continually "stuck" from having become swelled, and I had no means of resizing them; neither could I seat a ball properly and accurately, as I had no guide to enter the ball in the shell. The Whitney Arms Company advertise and illustrate only a cap-extractor, ball-seater, and bullet-mould. The Providence Tool Company used to make reloading tools, but they did not comprise all the parts needed, although they were very good tools as far as they went, everything being done by the pressure of long lever handles. The "Brown variform reloader" does not comprise all the tools required, and, in fact, I never have seen a combination tool yet—and I have seen, or examined from advertisements, a good many—that filled its expectations, or that would do all that was claimed for it; and I have never seen but one advertisement of a resizing die, calculated to resize the entire length of the shell.

In order to tell exactly what is wanted I will have to go through the entire operation of reloading a shell as practiced in the army, properly, so as to give constant and proper results.

First—De-cap the fired shells. This is done usually with a primer punch, the body of which fits closely but not tightly in the inside of the shell, there being a fine steel punch in the end that passes through the central vent and drives out the exploded primer. This punch may be a plain round piece of steel, the shell in such case being seated in a recess in a block of iron or steel, with hole to allow the old primer to drop through, or it may be in the form of a pair of pliers, the punch being then pressed in by the handles.

Second—Wash the shells in boiling hot water until all the residuum has been removed, then bake the shells in a hot oven until they are thoroughly dried. Any remaining dirt may be taken out with a stiff round brush.

Third—Lubricate and resize each shell by driving it into the resizing die with steady and straight blows of a mallet. The resizing die should rest firmly on a support, and is provided with a punch for driving out the resized shells. The die and shells should merely be greasy and not wet with oil, as too much oil causes the shells to "buckle" in the die. Always resize each shell before recapping or reloading.

Fourth—As the resizing die punch is apt to leave a slight burr on the mouth of the shell, each shell should be lightly scraped with the shell scraper (a three-cornered piece of tempered steel set in a handle) on the inside edge around the entire mouth to take off this burr, but not so as to thin the shell.

Fifth—Re-cap, seating the primers well home, and being careful to see that pocket is free from dirt and the vent properly clear. Primers should preferably be seated by pressure, and the tool seats the primer the exact depth each time, so that there can be no exposed primers if the tool is properly used. The end of the screw or plunger which presses in the primer is so made as to insure the primer being seated at least 0.005″ below the surface of the head.

Sixth—Enter the re-capped shell into the reloading die, place the latter thus in the safety socket, measure out the powder with the powder measure, seeing that it is set to the proper weight, pour the powder into the shell through a funnel placed in the mouth of the reloading die (the longer the funnel the more powder can be got in the same space up to certain limits. I have used a funnel with spout over two feet long to get large charges in small shells), press down the already lubricated bullet through the mouth of the reloading die, observing that the cannellures are all full of lubricant, and drive the bullet home with the reloading punch, driving the latter until it is clear down with its shoulder on top of the reloading die. The bullet is then seated home and the cartridge will be of the exactly proper length. Press the loaded shell from the reloading die and it is ready for

Crimping.—Press the loaded shell into the crimping die, the head of the shell resting in a recess in the safety socket. Drive down the crimping die upon the shell with the mallet as far as it will go. Press out the shell now completely reloaded.

We therefore need a de-capper and re-capper. These may be separate or may be combined in one tool. In the army, for rifle shells, etc., they are generally separate; for shotgun shells they are combined in one tool, which can also be used for rifle, carbine and revolver shells. We need a resizing die: This is a tube of steel hardened, the interior being the exact shape and size required to resize the shell to its proper dimensions. The resizing die is five-thousandths of an inch less in internal diameter than the average chamber of the gun, hence resized cartridges will always fit even the chambers of guns that are of minimum diameter, and about the exact length of the shell. The punch is a cylindrical piece of steel, with an ogival point and a shoulder that fits the mouth of the shell exactly, the diameter of the punch body being that of the exterior of the shell. The shell being conical, but a light blow is needed on the punch to start out the resized shell. A suitable anvil should be provided with recess for the end of the resizing die to rest in both in driving in and driving out the shell, a hole being drilled through the anvil for the shell to drop into or through when being driven out. Shells should be resized after every fire, for otherwise there is no telling when a shell may stick in the chamber, and resizing after every fire prolongs the life of the shell, for it may spread in two or three fires when not resized, enough to prevent its being resized at all; whereas, after each fire the operation is comparatively easy and does not injure the shell.

A reloading die is absolutely necessary for accurate loading. It is again a tube of steel with interior the same size as the average chamber of the gun, and counter-bored on the end to receive the head. The upper interior end is slightly smaller for a length down to about the top of the shell (it is of the exact diameter of the bullet) and serves to guide the bullet properly into the shell, and hold it straight and concentric with the shell while being driven home. The reloading punch, with which the bullet is driven home, enters a certain fixed distance, so that the bullets are all seated alike, provided this punch is driven home, and when the punch is home the die then becomes an exact gauge as to the proper dimensions of the loaded shell. Any cartridge that fits this die, with punch inserted up to its shoulder, will fit the gun to a certainty, and each shell is rigidly gauged and inspected by its use while being loaded.

For cartridges that are to be used at once, or are not to be subjected to severe use, the crimping may be omitted, but I have found it better to always crimp. My cartridges are then waterproof, and are ready for any amount of knocking about, and I do not have to make allowances in aiming, as I would have to when using part crimped and part uncrimped cartridges. Crimping lessens the velocity slightly, and therefore changes the trajectory and necessitates changes of elevation from what would be necessary for those not crimped, leading to confusion when used together.

Never prime a loaded shell, nor attempt to prime it. This is one of the rules that always should be followed. It may be that a primer will jar out of its seat while the bullet is being driven home. In such a case throw the shell away, as it has become worn in the pocket until it is too large to hold the primers properly, and, even if it could be primed while loaded with safety, the primer is apt to work out again in the magazine of your gun, or while in your belt, and perhaps be the very cartridge you might load with for a very risky shot—to "get left" as a matter of course.

Now all this operation and description doubtless appears long and tedious, and it doubtless is so—but "whatever is worth doing at all is worth doing well," and certainly the rifleman should reload his ammunition as carefully as does the man of the "scatter gun," and I claim he should be more careful, for the man with the shotgun fires a scattering shot anyway, and a little, more or less, makes not so much difference, but the man with the rifle has but one bullet, and he wants that to go true to its mark and to go every time, for he hunts more valuable and more dangerous game than the shotgun man, and this cannot be guaranteed unless he is as careful about his ammunition as he is about his gun. The strictest and most scrupulous exactness should be demanded, and never rest content with "Oh! that will do; what is the use of being so blamed particular!" That one sometimes hears too often.

The man with the shotgun can and does generally provide himself with the best reloading tools the market affords, not only for rapid but exact work. Tools are to be had for the shotgun that fill all the requirements, therefore why should they not be provided for the rifle, where exactness is so much more needed?

And now I would ask sportsmen and manufacturers if we have any reloading tools that will do the work described above? Has there been any real effort to produce proper tools, and will any "makeshift" answer? Is it any wonder that some manufacturers refuse to warrant their guns unless their manufactory ammunition is used? For do not the manufacturers know that there are no proper tools, and that shells cannot be loaded properly with tools to be had?

As to the labor of reloading I cannot but admit that it is hard work, but the results more than repay for the exertion. One can choose his own powder, can regulate his own charges within certain limits, and can in every way produce better cartridges than those of the manufactory, while the expense becomes much less. By taking one operation at a time (such as resizing all, recapping all, etc.), the reloading can be done quite rapidly, and one soon acquires skill and exactness. I have reloaded hundreds of shells, have never met with any serious accident, and have had more faith in my cartridges than in any I could buy.

I would not advise any one to try and make their own bullets. Cast balls are not as accurate in their flight nor so invariable in their work as are those made at the factories. These latter are swaged from lead wire by powerful machinery, and are much more homogeneous and symmetrical than any home-made balls can possibly be, even when the latter have been swaged by the swaging mold and punch.

I would invite attention to the fact that nothing has been said about the "lubricating disk" in the above description, and this simply because it is no longer used. I know that it was used, and that some authorities still claim advantages for it; but it is not used in the army. I used it some years ago and found no good results therefrom, and abandoned it. I found that it fouled the bore and caused the gun to lead more with it than it did without. The carbonaceous matter contained in the disk would burn and leave a crust to adhere to the bore in addition to the residuum of the powder, and wilder shooting resulted than when it was not used, unless the bore was carefully wiped after each shot. But if the bore is to be wiped the disk is not needed, its office being to keep the bore lubricated for each successive shot when not wiping. Perhaps a thick felt wad would prove beneficial as tending to clean the gun and prevent leading where non-wiping matches are being shot. But it must be remembered that this wad would be between the bullet and the powder, and would not be in position to sweep out either lead or residuum from in front of the bullet, so that the bullet would yet have to encounter the residuum from the previous shot, and the wad would not prevent such residuum being left by the powder burning behind it; so I think it of little value.

For hunting, if the ball has been properly lubricated before being seated in the shell, there is no great necessity for any additional lubrication. At target practice I have obtained the best results from wetting the point of the bullet with saliva; this reduces friction as well as grease, and there is no residuum from the saliva on the gun. Many dip the bullet in oil, but I claim that this fouls the piece more than saliva and does not give as good results. In hunting with singleloaders the bullet can be thus moistened in the mouth; but for magazine rifles this is of course impossible; but then it is not so very great importance after all. If one uses good clean powder the fouling from even ten consecutive shots will be but a trifle, so little that one can still see the glitter of the iron the whole length of the bore (I have fired over an hundred shots from a Ballard gallery rifle before it was cleaned, and we were shooting at five-cent pieces at fifty feet and still did good shooting), and one has plenty of time generally to pull a field cleaner through his gun after every few shots even when hunting. What one wants in a magazine gun more than in a singleloader, although it is of importance there, is to see that his primers are properly set, his shells properly sized, his bullets properly seated, and then he can go forth confident that he has done his duty by the gun and the gun is ready to do its duty by him.

The primers for cartridges should be carefully selected according to the shells used, and no attempt be made to use anything except just exactly the right thing. No makeshifts will do; but the exact primers for the shells must be had to insure success. That this want of uniformity in shells and primers causes confusion, discontent and disgust I am well aware from experience, and I know, for I have tried it myself, the temptation to make something do that is wrong because that which is right cannot be obtained. One may have Winchester shells and be only able to obtain (close at hand and in a hurry, because one is out) the Berdan primers, or some other form that is not suitable, or *vice versa*, and be disabled for the time being. The only remedy that I know of is to adopt some uniform shell for use and keep a stock of shells and primers always on hand, in quantity sufficient to meet any emergency.

For repeaters, do not use too sensitive primers. The mainspring should be tested, and if found too weak for thick primers, replaced by a stronger one. It is always well to have an extra mainspring or two on hand at all times for possible accidents; but a weak mainspring may be stiffened temporarily by putting an auxiliary spring, made from any thin piece of spring steel, either under or over the spring, depending upon its position or bend.

Examine and see that your shell heads are large enough in diameter to fill the counter-bore completely yet easily, and that they do not slip by the extractor in singleloaders, for some day you may get badly "left" if you do not.

In all singleloaders that I know the extractor fits into a recess in the counter-bores and must go home before the shell, so as to be in position to extract. If the shell slips by you cannot get the extractor home and cannot either close the piece or get out the cartridge that has slipped by, except by pushing out with a rod or jarring the butt on the ground, and you are temporarily disabled and perhaps just when you need the shot the most.

To the many this may seem to be a needless precaution, as they naturally suppose that all shells of each caliber are the same by all makers, but from experience I know this is not the case. Another reason for my abandonment of the Lowell shell; for I had fifty of them that I tested one after another in a Government carbine and they all slipped by, and other ammunition, made by the Government, fitted all right; and yet we were supplied with the Lowell ammunition for campaign against Indians; it was entirely new, just out of the factory boxes, and was caliber .45 and intended for caliber .45 guns such as our carbines.

Perhaps it may serve as a lesson to some to hear how I came to learn this. It was in this wise: While on White River, Colorado, in the fall of 1879, my attention was called to a carbine that was disabled by the shell having slipped by the extractor. The officer who had the carbine had just come back from looking for grazing ground, and while out had run across a large wildcat, and had got down from his horse, slipped a cartridge into his gun, and started to kill the cat. The gun was a U. S. Springfield carbine in perfect order. He found he could not close the breech block, and on looking to see why, found the shell filled the counter-bore and closed up the recess in which the extractor should lie when home. Having no rod he could not drive the shell out, and had to abandon his shot, leaving the gun in a disabled condition until he could get back to camp and have it repaired.

I examined the gun carefully and tested it with every cartridge there was in the officer's belt, as well as others from other belts, and all slipped by when dropped into the receiver and pushed home. All these shells were the Lowell shells and were a trifle smaller in diameter and a good deal thinner in the flange than the Governmet ammunition proper, none of which slipped by or could be forced by, as was found on trial. Since that time I have always looked to see that I had what I should have and in a thoroughly reliable condition. It might have been something worse than a wildcat that had been found, and it so happened that only a few days before the same officer was jumped by the Utes and corraled in a ravine all the afternoon with his entire escort; but on that day he had regular Government ammunition and found no trouble in using his piece.

But I have said enough, perhaps nothing that is new to the many, but again perhaps a good deal that is new to some, and my desire to see this important subject properly recognized has been my excuse. I hope that others may give their experience, either agreeing with or contradicting mine.

WYOMING. C. D.

MAINE LARGE GAME.—Munson, Me., July 16.—The wonderful increase of caribou and deer since the game laws have been enforced in this region is acknowledged by those who have been the most bitter opposers of these enactments. One day during the past month a caribou was seen in the orchard of a farmer near this village, and during the day he swam across the lake to the forest within view of the Lake Hebron Hotel.—J. F. S.

BULLET VERSUS BUCKSHOT.

Editor Forest and Stream:

I wish to call your own and your readers' attention to a subject which has occasioned me much surprise, and if it astonishes and chagrins a frontiersman, who is familiar with rough experiences, how much more should it engender a kindred feeling among the more refined of sportsmen?

I have read carefully your columns for the past four years, and to them is due the credit of educating out of my nature many pot-hunting proclivities; *i. e.*, if taking sitting shots be pot-hunting, and I believe a majority of your correspondents are of that opinion. At present your columns are singularly free from those two nauseating terms, "pot-hunter" and "gentleman sportsman," which have pervaded nearly every communication published the past few years. This result is due, or largely so I believe, to your own caustic editorials on these subjects.

And now allow me to suggest another abhorrent practice, a relic of barbarism, which ought to have been relegated to the past centuries ago. I refer to the brutal practice of shooting deer with buckshot.

It is difficult to believe that men exist in this nineteenth century so little advanced beyond savages that they have the heart to deliberately shoot a charge of buckshot from a hand cannon into the body of the most beautiful animal in creation; but evidence of such taste comes to us in nearly every issue of FOREST AND STREAM, in some inquiry for the best gun to shoot buckshot, or in a glowing description of some hunt where the writer lauds his prowess and boasts of his wonderful gun that sent its dozen buckshot clear through the body of a deer at a hundred yards.

Any manner of killing game is cruel, but those methods which require a little skill and give the game some chance of escape are the only ones which sportsmen should ever practice.

If a weapon could be devised which would make a clean kill or leave the game untouched, it would be a glorious thing; but there is no such thing known, therefore the arm which approaches nearest to that result should alone be used.

If a man were starving and had no weapon but a shotgun he would be justified in killing a deer with it, but under no other circumstance, and then he ought to have decency enough to keep his deed to himself, and not publish to the world his disgrace.

It was my fortune not many months since to be one of a party which went in search of a grizzly. It was a mixed crowd of army officers, clerks and farmers. One of the latter was armed with this same phenomenal shotgun charged with buckshot. We did not find the bear. We did happen onto a deer which received the contents of the shotgun at about fifty yards and of course left on the jump. Another of the party opened fire with a Henry rifle, and knocked him down, but again he jumped and ran for life. He left a plain trail of blood which was followed. At a distance of fully a mile he was found dead. The rifle bullet had done the work of quick killing. Upon skinning, one buckshot was found to have entered the paunch and lodged under the skin on the opposite side. Enough to have killed the poor animal after a few days of most intense suffering, and that would surely have been his fate had not the more human rifle come to his relief.

The brutality of the shotgun man deserves to be announced by all sporting journals. A thorough ventilation of such "sport" would, I believe, educate men above it. If the use of the shotgun on deer were entirely discontinued, deer would increase largely, for the majority of those which are struck by buckshot escape, crawl away and die, doing the hunter no good, affording him no sport, and diminishing the supply for breeding purposes.

In this day of cheap and reliable firearms, a good, accurate rifle can be bought for a trifle, say $20 or $25. Every man or boy in America, who can find time to hunt, can possess one if he choose. If too poor to buy one, borrow for the day's hunt, a few hours' practice will make you sufficiently proficient in its use, to hit the vital part of a deer at ordinary shotgun range. Then if your hunt be successful you have not committed a deed which will trouble your conscience the remainder of your days. PIUTE.

FORT BIDWELL, Cal., July 5, 1884.

OREGON SKIN HUNTERS.—John Dunphrey, an engineer on the west side road, who is in the habit of taking a yearly hunt for deer in the mountains of Southern Oregon, a few days since received a letter from a friend at Grant's Pass, of which the following is an extract: "I expect you will be out this fall to take your annual hunt. You had better come as soon as you can if you want deer, as the skin hunters are killing them off very fast. You will hardly believe me when I tell you that two of these fellows now encamped eight miles below this place, brought in and sold here last week 130 skins, all killed during ten days in June. One of the hunters said that he killed twelve deer in one day, and in two days caught ten fawns, which he marked. When asked what he did with the venison he said he did nothing with it. His name is Stonebreaker and his partner's name is Ferrin. They got ninety-eight dollars for their load of skins. I saw the skins and the blood was not dry on some of them. I can prove every word of this. Skin hunters have been slaughtering deer all this summer, along the cañon by the railroad. The small mountain streams are dried up and the deer are obliged to gather along the larger streams for water and there is where they catch them. These scoundrels defy the law and say they have a perfect right to hunt on Government lands. It is high time this business was stopped. Just think how many poor little fawns these rascals have caused to starve and die." The above is from a responsible person, and there is no doubt of its truthfulness. The authorities of that section must be very remiss in their duties to allow such wholesale violation of the game law. The first game law passed in Oregon was originated in that part of the State, and was intended to prevent just such scandalous slaughter of deer for their skins as is mentioned above. Those skin hunters should be in the penitentiary, or better have their hides made into drum heads; the hulking, lazy, useless brutes are worse than wolves or coyotes. The people of Southern Oregon should combine and hunt them out of the country.—*Portland Oregonian.*

GRASS PLOVER.—Philadelphia, Pa., July 21.—A great many grass plover are being killed in this section. The season is just about in, but the birds are yet in poor condition. The pastures about Philadelphia are thronged with them, and their whistle is heard nightly as they arrive hereaway. Many gunners are after them, and about one or two birds fall to the share of each gun. Well may the grass plovers in this region whistle "we are all surrounded."—HOHO.

SPIDER LAKE GAME.—Sherbrooke, Quebec, July 12, 1884.—Have just returned to-day after spending a week at Spider Lake. Good bass trolling in the lake, and trout fishing on the Upper River. Saw deer every day and tracks of moose are numerous. Have never seen a season at Spider that looks more promising than the present for large game, and only hope they may be protected until the open season, Sept. 1, so as to give us all a chance. The existing game laws prohibit the hunting or killing of any female moose until Oct. 15, 1885. Am glad to see your correspondent "Penobscot" again to the front. He is familiar with the locality referred to. Have been very much amused with that character "Antoine," who visits "Uncle Lisha's workshop." I can pick out half a dozen French Canadians who would answer for his original so far as the broken English is concerned.—D. THOMAS.

WOODCOCK IN NEW HAMPSHIRE.—Dover, N. H., July 21, 1884.—*Editor Forest and Stream:* Woodcock in this section are not very plenty, while on the other hand partridges seem to outnumber them five to one. I know to my certain knowledge that parties have shot woodcock here this season. Our open season commences Aug. 1. It seems a shame that persons, for they can't be called brother sportsmen, should so lose all sense of what becomes a true sportsman, as to shoot game out of season, and especially woodcock, to secure which a sportsman has to journey many miles to make a fair bag. These parties should receive the full letter of the law in their nefarious business.—WOODCOCK. [Why does not "Woodcock" lay his evidence before the game wardens and secure the punishment of the offenders?"]

AFTER ADIRONDACK DEER KILLERS.—After working almost alone for four years or more to get something done to stop the slaughter of deer in the region south of here during the spring and early summer months, I have at last got the State Game Protector of St. Lawrence county to visit that region. He went up last week and procured evidence that will, he says, convict three of the parties, and he will prosecute them to the full extent of the law. He also appointed a deputy protector residing in that vicinity, whose duty it will be to watch for and prosecute all caught violating the game law.—A. C.

A CHATEAUGAY LAKE ASSOCIATION is being talked up, and a meeting for organization will be held at "Ralph's" Aug. 18. Its membership will embrace any visitor to or resident of the whole Adirondack region. Two of the most important purposes of the association will be the employment of men to look after the game interests of the mountains and the raising of a fund to yearly place in the various lakes, ponds and streams young fish. All who may wish to join this proposed association in any way can address Mr. W. S. McKean, Rogersfield.

BLACK-TAILED DEER ANTLERS.—Mandan, July 15.—In No. 24 I read of a correspondent that has a black-tailed deer's antlers with twenty-five prongs. I saw a black-tailed deer's head, that was killed sixty miles north of Mandan, that had thirty-two prongs.—HUNTER.

Sea and River Fishing.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—XI.

WITH characteristic pluck and perversity Knots had stuck to the oars; the devious course was ended; and he and Dick were now resting in the shade just across the little bay from us. When we had filled our last bucket with most excellent minnows and a few barred perch of the right size, we gave up our stake to three anglers, who had come up out of big Black River in a yawl in search of the Kingfisher party, as they said, but as they did not introduce themselves we failed to learn their names. They were not inclined to be very communicative, but we learned that two of them were from Detroit, while the other was an "Ohio man," and that they were fishing over at Long Lake, five or six miles below. They had taken a notion to try the bass in Black Lake a few hours and at the same time hunt up our camp. They had walked across from Long Lake to the river, a mile and a half, got a boat of a Mr. Cross, living near the head of the rapids, and here they were, fishing for black bass with worms. Just think of it, ye honest anglers.

They had stopped awhile at the stemwinder and one of them had taken a four-pound bass with a bunch of wriggling worms, a proceeding that so disgusted old Dan, when told of it, that he straightway exploded with, "deliver me from a worm fisher, any how!" We left them tied to the stake catching minnows, and pulled over to the raft to stretch our legs and try for the mate to their four-pounder with legitimate bait, for we were something of Ben's mind when we summed up his opinion of worm-fishing for bass in about this shape: "Ef I can't ketch bass without fishin' fur 'em with bait that's only fit fur white suckers and red hoss, I don't want no bass."

When the strangers had filled a bucket with minnows they came over to the raft, and soon after Knots and Dick pulled across to us, and the stemwinder bristled with seven rods, all feeling for the mate to their big bass; but a half hour's patient work failed to induce a strike except by an eighteen-inch pickerel that one of our party took, which was kept alive to bait the big hook for the big mascalonge as we went back to camp.

Our three anglers soon left for Long Lake, but before going they told us they were having fine sport over there with the bass—nearly all of the wide-mouthed tribe—and they were doing their fishing with worms. Now, this manner of bass fishing may be a pardonable offense among some fishermen, but were a "Kingfisher" caught angling with a squirming worm he would be drowned on the spot, or drummed out of camp to the tune of the "Pot-fishers Quick March."

Long Lake may be reached from Black Lake by going down the river to Cross's, a matter of three miles, and from there a mile and a half will take one to the head of it. A team may be had of Mr. Cross almost any day to haul a boat over, and on the lake shore is a very good little tavern, at which accommodations and boats may be had. The better way, however, to reach this lake is by team from Cheboygan.

Leaving the stemwinder, Muller and I started to fish around the shores of the little bay with our new bait, and before we had gone a hundred yards I struck and persuaded my first and only bass in Black Lake—a black-backed hard fighter of three and three-quarter pounds. I don't like to say this was the only one I took, but truth is nudging me to stand firm and I must so record it. Did I feel good over that first and only bass? Why, that fight was just an even balance for four days' first-class pickerel fishing, but I will not try to describe it lest, in the attempt to do it justice I overdo it. It was simply a glorious fight, and it was more good luck than skill, I think, that brought me out on top, for I confess to being a trifle nervous at points in the struggle where a hair would have turned the scale in favor of the fish.

Here at the mouth of the bay we saw another great mascalonge, near six feet, we judged, from the hasty glance we got of him. Muller had hooked and was playing a five or six pound pickerel, and as he was led near the boat and when only a few yards away, the mascalonge made a swipe at him, but missed by barely a couple of inches, a sudden twist on the part of the pickerel saving him from being crushed by the powerful jaws of the big fish only to meet a milder death by the club. He was a monstrous fish, probably as large as the one Dan and I saw, as Muller will be qualified that his head was fully eight inches broad at the eyes. We did not fish for him, as it would have been utterly useless to fight him with our tackle, among the grass and gigantic water weeds that grow around the mouth of the river and little bay, for to handle a fish of this size would require plenty of sea room in water clear of grass and weeds, and we did not feel like breaking up our rods in an encounter that would be sure to result in disaster to us. Here were three of these great fish seen by us in a few days, some miles apart, and I am convinced that the lake contains many others of the same kind, and possibly a few that are even larger than those we saw, but this is hardly probable.

Another hour's fishing resulted in more longsnouts, but not another bass, and we left for camp very much impressed with the belief that we were there quite two months ahead of the season for them. We fished awhile around Pickerel Reef as we went up, for the old chief that Dan and I held a special claim on, but the eighteen-inch longface on the big hook failed to attract his attention, and we went on to camp with another backset added to my score.

The day's fishing had, however, put us in possession of the fact that the "automatic abortion" is a fraud and a delusion as a bass reel, and subsequent performances of the machine has not altered our convictions. I expect this will raise a howl from the sun fishers and fingerling trout murderers, for the contrivance is specially adapted to this kind of fishing, but our minds are made up, and we are prepared to be covered up with abuse rather than concede a point in favor of this ingeniously arranged, but "wuthless affair."

At camp we found the other boys had not been out, owing to the rough water, but they had passed the day pleasantly in "reminiscences," smoking the pipe of contentment, etc., and Jim had actually distinguished himself by picking a camp-kettle full of huckleberries, and that evening Dick promised he would make a huckleberry roll next day big enough to kill the whole party. The roll was planned and constructed with perhaps the best intentions on Dick's part, but as he had forgot to put any shortening in it, his promise of a wholesale slaughter of the camp came very near being made good, as all who partook of that mass of tough dough and berries will remember it, if they live to be as old as "Methuscler." "Talk about eatin' crow," said Ben. "Crow ain't a marker 'longside o' that roll; Dick must a shortened that dough with injen rubber and b'iled owl."

Next morning the wind was an early riser and the lake was too rough to fish. We hung around camp till noon, but as the blow showed no sign of abating, Muller and I took our rifles and went back on the plains for a bear hunt; but it wasn't a good day for bear, and we came back to the camp after tramping down several hundred acres of huckleberries, and told the boys a half dozen barefaced lies about bruins that we expected to see, but didn't.

The nearest we came to seeing a bear was once when Muller called to me to come and look at some large tracks in the sandy road leading to Black River, which he said were tracks of the very varmint we were looking for, but on close investigation they proved to be the tracks of one of Merrill's old oxen.

This discovery moved us to make tracks straightway back to camp, where we were overwhelmed with congratulations on getting back alive, and next day the Assistant Postmaster was laid up with an attack of acute camp diarrhœa, from an overdose of huckleberry, which kept him in camp all day.

The wind was blowing a stiff breeze next morning, but the rest of us managed to fish all day with good results, as far as Merrill's bar'l was concerned; a few bass were taken, none, however, by the rod of ye writer.

We were now growing a little tired of bass fishing, and that evening around the camp-fire a five or six-days' trip to the Ocqueoc for grayling was planned, but when Stewart came to camp next day to arrange for the trip, he told us there were no grayling in the stream, but plenty of trout might be found if we struck it high enough up—some fifteen or twenty miles from our camp.

We began to consider whether the sport in prospect would pay for the trouble of reaching the stream by a rough, tedious road, and the trip was finally abandoned as one likely to prove unprofitable in the end. Then symptoms of I've-got-enough-of-this began to float around through the air, and next day Knots proposed that we break camp the following Tuesday instead of going to the Ocqueoc.

He gave as a reason for this move that the time of four of the party was nearly out, and as Dan, Ben, the Deacon and I wanted to go over to the Intermediate Chain before returning home, it would hardly pay them to go with us for two or three days at the old camp. I did not want to break camp, for I liked Black Lake, and I wanted to make a trip to the Ocqueoc; but a vote settled it, and the majority—in fact 7 to 1—carried it to break up. (Mem. for November—There's nothing like being crushed by a majority, and submitting to it with grace and serenity.)

The reasons given by Knots for wanting to break camp were good in their way, but we had a faint notion that the groundwork of his structure rested on the fact that the "festivities" had about run out, and he wanted to get back to a base of supplies. But it was settled that we were to leave our pleasant camp, and next morning, Muller and I started in a boat for Cross's, down the Big Black, to get him to help with his team to haul us and our traps to town. We fished to the foot of the lake, not forgetting to spend a half hour or so around Pickerel Reef after the big masky, but he was not at home, and it was perhaps well for him that he was not, for we were fully determined to turn him inside out should he swallow the pickerel and big hook trailing at the stern of our boat. The ride down the river was a very pleasant one, and we enjoyed ourselves like two schoolboys out for a frolic, pulling here and there sweet-smelling water lilies that grew in patches in the water along shore, or stop-

ping occasionally to pluck a wild rose that hung over the stream, till we had the boat full of rare perfume.

Mr. Cross was not at home, but his wife, a sweet-faced, middle-aged matron, told us he would be engaged with his team the next Tuesday, and could not promise to help us for a day or two after. Another backset.

The Cross farm is a little cleared patch right on the low bank of the river, and is as lonely a looking place as one can imagine, but Mrs. Cross said she had become accustomed to the solitude and did not mind it so much now as when they first settled there. The children and the deer that visited their little wheat field in front of the door at this season kept her company, and she was contented with her lot. She said that had we come a few minutes sooner we might have seen a deer swim the river just above the house, but we were glad we did not see it, for flesh is weak and Muller had his rifle along. We said good day to the matron and took our way back up the lovely stream and to camp, satisfied that contentment abideth not alone in the great cities. If this ever meets the eye of the gentle-mannered and kindly lady, she will recognize the writer as the smaller one of the two that drank up all her buttermilk, and asked if there were not a few drops left; and she may call to mind now we laughed when she told us she preferred a pickerel for the table to "a nasty thick-skinned bass." And she may be assured too, that brother Muller and the writer join in wishing her many years of quiet happiness in her little cabin on the bank of the Big Black, and we trust the "Crosses" she may be called on to carry through life may not be more of a burden than the little flaxen-headed ones we saw playing around the door. Blessed are they that dwell in peace and content in that virgin woods, for they are the "salt o' this livin' earth." (Ben.)

Back in camp again long before sundown, we had pleasant visitors that evening in the person of Judge S. N. Maxwell, an enthusiastic member of the Cincinnati Canoe Club, and three companions, who were camped for a day or two at the sandbank. They had come up the river in their canoes to the foot of the rapids, had then hauled around and were here for a couple of days' sport and sailing on Black Lake, and had come over to our camp this shank of the afternoon for a brotherly call. The Scribe acted as master of ceremonies, and notwithstanding the low state of the festivities they were not allowed to take their way across the lake with dust in their throats. They left for Cheboygan next day, in order to run the rapids in their canoes before a promised run of logs would most likely form a jam and force them to make another portage around.

Just below the roofless loggers' cabin, a stone's throw from our camp, two wandering brethren had pitched their tent a day or two before, but they, too, left us next day, in order to be ahead of the logs in going down the rapids. They had been wandering around over the North Woods for a couple of weeks, wherever they could find water to float their boat, and hearing of the attractions and beauties of Black Lake they had come up here to enjoy a few days' sport and comfort. If I remember, they were a Mr. Arthur Clement, from Joliet, Ill., and a younger companion from somewhere in New York State. They were pleasant, companionable gentlemen, and we were sorry when their boat disappeared from sight around the point below.

That night neighbor Merrill walked two miles in the darkness to get another neighbor, Mr. Bush, to help Stewart get us to town, and the arrangement was made for us to take our outfit in the boats to the landing below the sandbank where we first struck the lake, where they would meet us with the wagons.

A MORNING'S FISHING.

THERE is a necessity in our very natures for relaxation, not so much for rest as for change. It may and generally does require more exertion and actual expenditure of physical force to hunt or fish for a day than is required for several days devoted to our usual vocations, yet for all of that the day's hunting or fishing is restful, and one works better for the indulgence. A few weeks ago "our print shop" finished the big job of the season, one that had kept the full force hard at it to complete within contract time, and fully believing in this law of relaxation it was decreed that the day after the completion of the given work should be a holiday for all, from the editor to the urchin with the profane cognomen who is supposed to preside over the inky domains.

The foreman of the compositors and myself decided to go fishing, and fishing we went early in the morning. It was arranged to start at 4 o'clock; our team was engaged, tackle and boots placed in readiness the evening before, and a basket of provisions packed under my supervision. Our objective point was some seven or eight miles away where a broken and abandoned dam obstructed the Iowa River, affording superior fishing.

We were off on time, and before sunrise were at our fishing grounds. The foreman was detailed to make coffee and ge breakf ast while compositor and myself took the minnow seine, donned our rubber boots and finding a sandy shallow bay proceeded to supply a goodly quantity of bait, which we were not long in doing, but not before a pot of splendid coffee was waiting for us, and hurriedly disposing of our breakfast, for which we had an abundant appetite, we betook ourselves to the anticipated sport. The Iowa River this near its source is not a large stream, being only six or eight rods wide, and quite shallow. No such strings of fish are to be taken from its waters as can be from the lakes or the rivers in newer parts of the country, yet it abounds with black bass, pike, pickerel, catfish, and many other varieties of that joy of the small boy, the sucker tribe. It is a clear, limpid stream, running over a rocky and sandy bed, and among some of the finest scenery in all prairiedom. Many a fishing excursion has the writer taken along its pleasant banks, seldom returning without a very fair string of fish.

On this occassion we industriously fished the eddies and pools about the stranded logs and scattered rocks below the old dam and were fairly rewarded therefor. The compositor was the first to land his fish, but soon the rest of us had done as well. We quit in time to get home by noon, and upon counting them found we had seventeen fine bass.

It was a pleasant trip for us all, and although we worked harder than we should have done had no holiday been taken, we felt better for it and the next day took up our work with more energy, and I believe there was no loss to the business because of the diversion.

By the way, there is one stock subject or theme, upon which much is said by certain of your correspondents, which I do not quite understand, and I know that many who keenly enjoy angling can join me in this, and that is the element of "gaminess." Is not this a kind of fashion or "Oscar Wildeism?" One will write of taking a little bass or pickerel weighing a pound or two, and tell how it fought, and how it made his pulses beat. Some of them even time the "struggle," giving the number of minutes, as one did lately, saying "time of fight, 20 minutes." Now I do not exactly understand this. I have caught such fish and much larger ones in both lakes and running water, and I have tried to get up such combats and failed. I have let a five or pound six pickerel have the line to run with, and they will run until it fairly hisses through the water, but I know that fish is fast and unless the line is thrown slack he cannot get off the hook, and I also know that I can stop his race at any time I see fit, and take him out of the water, and that almost without his pickerelship making a struggle. I can see no rare sport in letting a fish swim about in the water, thinking it can get away, when I know it cannot, and that I can take it from the water at any time I please after the hook is struck, and such sport seems to savor more of cruelty than is necessary. I think any fair-minded man who will take the trouble to catch the "critter" will agree with me that a sucker or red horse will, pound for pound, "fight" harder, and give its captor more trouble in getting it out of the water if he will attempt to take it as soon as it is hooked, than will a pike, pickerel, or black bass. This may be rank heresy, but it is my experience. W. S. P.

ELDORA, Ia., July 12, 1884.

"SALT-WATER FISHING."

Editor Forest and Stream:

Your article on sea-fishing and the replies lately published were read by me with much interest. I am as fond as any one of trout fishing, but I do not consider that the only kind, nor do I sympathize with the pharisaical spirit which holds that among sportsmen, he who wades the stream and throws the fly has the sole monopoly of virtue, poetry, and peace of conscience. The truth is the two kinds of fishing are distinct. Each suits its own mood; each satisfies some bodily or spiritual want which the other cannot meet; each demands, and so fosters in its votary, certain valuable but different qualities, moral and physical.

Salt-water fishing, however, undoubtedly occupies but a small space in sporting papers. It is probable that if more interest were shown and more written about it, its methods might improve; and, conversely, such improvement would create interest. Last summer I tried for the first time trolling with rod and reel for bluefish. The result seemed to me so satisfactory and such an improvement over the hand line, that I send you the following account, in the hope of interesting, and perhaps calling out suggestions from some of your readers.

The ground we visited was Nantucket. Off the extreme point of this island are bars, over which, at low tide, there is a considerable surf. In this rough water bluefish were nearly always to be found. For the most favorable conditions the tide must be on and the wind off. This enables you to sail along the edge of the rough water (to go through it would drive out the fish), the tide carrying the trolling lines into it. For tackle, we used the ordinary bass rod of about sixteen ounces, though I have no doubt a lighter weight would do, and about one hundred yards of twisted linen line, rather light. We found this length sufficient, though some might feel safer with more. The spoons were rather small size, made by Gregory, which we refitted, using but one set of larger hooks at the tail, rigged with copper wire instead of gimp. This gimp or fiddle string, by the way, seems a special favorite with tackle makers, the theory being that a fish cannot bite it off. This is probably true, as they always break it. In trolling we were more successful when at moderate speed. In high winds we hooked fish nearly always when going about. A strike when under way makes lively work for a few minutes. As your reel starts the skipper throws the boat into the wind, and your companion gets in his own line to give you room, meanwhile you must handle your rod, control the line without losing a finger, keep clear of the main sheet, see that you are not knocked over by the boom, and remember to smile and pretend to like it when the sea shoots over and soaks you, which it is sure to do. As the boat loses way your fish is just getting under way; the reel probably stops and the line slackens until you think he has probably left you. After a moment of dreadful doubt and rapid reeling you find he is still fast and may then address yourself to bringing him to gaff with what skill you are master of. Not being in the season for the largest fish, the heaviest we caught weighed ten pounds.

In closing, I may state that the catch will not be large, probably not above one-fourth of what would be taken with hand lines under the same conditions. There are several reasons for this. Where four hand lines can be used, not more than two rods can troll with any comfort; otherwise tangles and maledictions are inevitable. Again, the time required to land a fish is much greater, during which, also, the other rod is out of the fight, and can enjoy himself only as an altruist. I suppose, too, there are not many spots where, as here, the fish keep in a comparatively small space. At sea, or where a school must be followed up, the rod would be still more unproductive. Yet, where it can be used, the capture of a large fish will inspire the true angler with a feeling of self-respect and deep satisfaction which mere numbers cannot yield. C. E. P.

PHILADELPHIA, July 19.

[The second paragraph in this article is exactly the idea we wished to convey, *i. e.*, if more were written about salt-water fishing the interest in it would increase. The tone of our much-criticised article was that sea fishing does not seem to inspire its votaries to write about it; they are content to catch fish and to trust to makers of tackle to improve their tools. There is no experimenter like Mr. Wells among them.]

Editor Forest and Stream:

Your editorial of July 10, on "Salt-water Fishing," has stirred up a brace of correspondents to write in defense of the charms of their sport. They seem to me to bear witness to the truth of your remarks rather than to controvert them. Mr. C. T. Duncklee mentions Scott and Roosevelt as authors who have been poetically inspired by sea fishing, but a perusal of Scott will show that it is only in salmon and trout angling that he becomes enthusiastic on the subject, and that when he treats of salt-water fishing he merely gives directions for the capture of the fish. The same may be said of Roosevelt, whose sense of humor makes him always readable no matter what may be the theme. His other author, Ward, I do not know.

Your next critic, "Knebel," proves the truth of your statements, for he measures his sport entirely by the pounds of fish caught. He says:

"I will give you an account of my sport and luck combined that I have had lately, hoping others will do the same. Friday evening, June 20, a party consisting of myself and two friends took the last train on the New York, Woodhaven & Rockaway Railroad to Broad Channel, Jamaica Bay (you can start from Hunter's Point, Bushwick or Flatbush avenues as well). We stopped over night; room and bed for $2.50. Got up at 3 A. M., took a boat and paid fifty cents for use of same. Pint of shrimp cost forty cents. Started at 3:30 A. M., tide running in, and went east to the club house, or a little above it, between the club house and a place they call the "Pot," known to most of our baymen, and dropped anchor, rigged our rods and commenced to fish about 4:30 A. M. I was the first to get the line over, and soon hooked a two-pound weakfish, and a hungry fellow he was, for he had my bottom hook away down in his belly. We fished until 6:30 A. M. The tide changing, fish stopped biting, and to be sure we stopped fishing, put up our tackle, and took a bite ourselves, which we had fairly earned after one hour and three-quarters of exciting sport, for fish at that time in the morning bite fearful and almost take the rod and reel out of your hands. We counted our fish, in sizes running from one and a quarter to three and a quarter pounds, and 139 was the number, all weakfish. Now if this don't come up to your fresh-water fishing, I mean when you fish for about five or six hours and catch thirty or forty fine trout from five to six inches in length, or about six to the pound, and instead of sailing to your hotel in a boat you must walk from three to five miles and carry a heavy load of trout, then I am greatly mistaken. We congratulated each other, divided our fish, and by 8 o'clock we fastened our boat to the float and took the first train for home."

This probably was sport, but it contains nothing instructive except the locality, expense, and the pot. Nothing of tackle, no observations on the surroundings except a reference to the bird called the quack, and is wholly destitute of the inspiration of the angler. It reminds one of the idea of fishing expressed by John Smith, of Pocahontas fame, who wrote of the fishing in Virginia as follows: "And is it not pretty sport to hale up two pence, six pence and twelve pence as fast as you can hale and reare a line?"

A trout fisher often has an enjoyable day on the streams when his catch is not worth mentioning, and he finds pleasure outside of the weight of his creel. It would appear that salt-water anglers, as a rule, have little besides their catch to rejoice in, because, as you have hinted, their surroundings are not of an inspiring kind. I troll for bluefish and also take them with the rod, but the prospect of a day's sport with them does not produce the pleasures of anticipation that an appointment to fish a mountain stream does. Nor does the retrospect of a day spent weakfishing linger in the memory as does the same time in the woods. I think it is the woods themselves that cause this difference. FONTINALIS.

SIZE AND WEIGHT OF BLACK BASS.

IT is a most difficult thing to get a rule that will give an approximation of the weight of any fish, taking its length as a base. This is especially true of the black bass, which varies so much in depth and thicknsss.

The largest bass which I ever weighed and measured was one from Rice Lake, Canada, of 6 pounds. It was 20 inches from nose to end of the caudal fin; 14 inches in girth and 3¼ thick. Another fish of the same length and thickness, but only 13 inches in girth, weighed 5¾ pounds. A bass taken from Lake Champlain, 16½ inches, the other dimensions not recorded, weighed 3¾ pounds. Small fish weigh less in proportion to their length than larger ones. From some crude memoranda I condense the following table of relative lengths and weights of black bass, the lengths being from nose to end of tail fin:

Length.	Weight.
8 inches	½ pound.
9 "	11 ounces.
9½ "	15 ounces.
10 "	1 pound 2 ounces.
10½ "	1 pound 6 ounces.
11 "	1 pound 8 ounces.
11½ "	1 pound 12 ounces.
12 "	2 pounds.
13 "	2 pounds 4 ounces.
14 "	2 pounds 10 ounces.
14½ "	3 pounds 2 ounces.
15 "	3 pounds 8 ounces.

There is always a difference in females at the spawning season, and this table is not to be considered as infallible.

POKE-O-MOONSHINE.

FISH-EATING PLANTS.

PROF. Baird has just received from Prof. H. N. Moseley, of Oxford University, England, a specimen of an aquatic plant holding in its fond embrace a considerable number of young fish which it has caught and killed.

This plant is the Great Bladderwort, known to botanists as *Utricularia vulgaris*, L. The species is widely distributed over England, and has been introduced into our waters where it is often found in abundance in fresh-water ponds and ditches and in the shallow coves along some of our river banks. It is a large plant, with stems often attaining a length of two or three feet. It has no roots, but floats free in the water, its root-like branches being covered with pinnatified capillary leaves, each bearing one or more small transparent hollow bladders, with openings at one end, which serve as traps to catch newly-hatched fishes, minute crustacea, worms, and infusoria. It has no digestive apparatus, but is thought to derive nutriment by absorption, from the decomposing animals.

The bladderwort has long been known to catch the lower forms of animal life, but it was only recently that its fish-catching propensities were discovered. Mr. G. E. Simms, of Oxford, was the first to call public attention to the fact, on finding that a specimen which had been placed in his aquarium for supplying oxygen to the water was actually catching and killing large numbers of newly-hatched perch and roach which had hatched from a mass of eggs lying at the bottom. The little fish were usually caught by the head, but some were caught by the tail, while others were doubly trapped, the head being held fast by one trap and the tail grasped by another, the body of the fish forming a connecting bar between the two.

To learn something of its destructive powers, Mr. Simms placed 150 perch fry in a glass vessel containing specimens of *Utricularia*, and at the end of two days all but one or two had been trapped.

Prof. Baird thinks the discovery has an important bearing on the future abundance of several of our important food-fishes.

Twelve to fifteen species of the genus, some of which have a wide geographical range, are found within the limits of the United States, and millions of fry must be annually caught in the little bladder traps.

The *Utricularia* occurs in abundance in carp ponds throughout the country, including the U. S. Fish Commission ponds in Washington, and in some localities has been in-

troduced at considerable trouble and expense, as it was thought to be excellent food for the carp. Prof. Baird will cause every vestige of it to be immediately removed from the Government ponds, and will warn carp-culturists everywhere to examine their ponds and destroy any that may be found there.

The specimen received from England has been placed on exhibition in the Fishery Section of the National Museum, where it can be seen by any who are interested in the subject. R. EDWARD EARLL.

NATIONAL MUSEUM, July 10.

THE SCHOODICS.

AT the Schoodics some good fishing for landlocked salmon has been enjoyed, though there comes the same complaint of unfavorable weather. The mystery is as great as ever why these lakes afford no large fish, unless the food theory is correct. There is no appreciable difference between the Grand Lake salmon and those from the Sebago waters, except in point of size, and yet fish have been taken from the latter waters weighing twenty-five pounds, while the salmon from the Schoodics (Grand Lake) seldom go above two pounds, and four-pound fish are very rare. The explanation of both Messrs. Stillwell and Stanley, Fish Commissioners of Maine, is that the food in the one lake is abundant and of the right sort, while in the other waters it is a quantity unknown or but little understood. This theory would seem to be confirmed, from the fact that large salmon are already being found in the Androscoggin lakes, although they have been but a few years stocked with these fish. A salmon was hooked the other day in Mooselucmaguntic Lake, which was large enough to break away from a rigging which would have been ample to have secured an eight-pound "red spot." A five-pound salmon has also lately been taken from Umbagog Lake, of the same chain. Besides, Mr. Stanley mentions seeing one on the spawning beds in Rangeley Stream (Androscoggin waters) when taking brook trout for propagation, in the fall of 1882, which must have weighed ten pounds. The abundance of fresh-water smelts in the Sebago and the innumerable chub and dace (*Cyprinidæ*) in the Androscoggin waters are doubtless the cause of the large size of the "black spots" (landlocked salmon) as compared with the Schoodic fish. SPECIAL.

GREENWOOD POND.—Monson, Me., July 16.—The numerous visitors to Lake Onaway (Ship Pond), in Elliottsville township, will be pleased to learn that E. H. Gerrish, the well-known guide, will open his camps at that beautiful resort about Aug. 1, and will remain there about two months. I spent four days a short time ago, camping and fishing at Greenwood Pond, one mile from Onaway, which is the water crossed by the traveler in his route to the latter place. Lake and spotted trout from two pounds to four pounds in weight were quite plenty. Many lake trout are taken in this pond which weigh six, eight and ten, and sometimes twelve pounds. The scenery is good, and although there are no land-locked salmon here as in Onaway, I believe the other fish are much more abundant, and I advise those who intend to visit Onaway the present season to tarry for a while at Greenwood, where they will undoubtedly find satisfactory sport. The spotted trout will rise to a fly, and the angler who retains the habit of the fathers by fishing with "live bait" and worms cannot fail of having a "good time." The laws against poaching and the special laws against winter fishing on several ponds are well enforced, and their good results are already apparent to all observers.—J. F. S.

CROTON LAKE.—New York City, July 19.—*Editor Forest and Stream:* Croton Lake, in Westchester county, is a splendid place for the New York business man to spend a few days fishing for bass. Every summer I make it a point to spend several days on this lake. The lake is filled with bass, white and yellow perch; the largest bass I ever saw taken there was last August; it weighed exactly 5 pounds 5 ounces, there are a great many taken weighing over 3 pounds, but the usual size is three-quarters to a pound. In one day's fishing my companion and myself took 279 bass, weighing 147 pounds. I have also, with two companions, taken a bushel basket full of perch in one day's fishing. The bass do not take a fly well and will not often bite at the spoon. I have always found the grasshopper and especially the cricket the most effective in killing. I write that you may let your readers know that they can have some fair sport fishing within an hour's ride by rail from New York city. Take the New York City & Northern Railroad and get out at South Croton. As for accommadations, they are fair, as there is a good hotel on the lake.—E. L. L.

NO MASCALONGE IN SARATOGA LAKE.—Your correspondent from Saratoga asks if any mascalonge have ever been captured in Saratoga Lake. I would say, having shot and fished in and around that lake for over 15 years, and being peronally acquainted with all the fishermen of local celebrity, such as old Pete Francis, Jim Black, the Averys, Rileys, old Uncle Bill Valentine, Harvey Cook, Dutch Henry, that was drowned in its waters, and a host of others, and spent many days fishing in their company, I never saw in all that time a true mascalonge (*Esox nobilior*) taken from its waters. I have seen the great northern pickerel (*Esox lucius*) shot in the spring weighing as high as thirty-three pounds. Have seen them caught by fair angling on hook and line to weigh from seven pounds to fifteen pounds. In conclusion would say I think if any mascalonge had been taken, as I know the fish well, I should have known it, but the vulgar error or localism there is to call all those big northern pickerel mascalonge.—WASHINGTON A. COSTER.

NEW BRUNSWICK SALMON.—Several Boston sportsmen have within a year or more become interested in leases of salmon waters in New Brunswick, on the Restigouche and other favored localities. Some of them have just returned from a fishing trip, and they are much pleased with the locality and the waters, but they report the fishing as having been very poor up to within a week or more, when some good sport was had, but no very large fish. The weather has been unfavorable and the salmon have failed to rise till of late. Good weather promises better things of the waters where the lamented Dawson so charmingly depicts the struggles of Chester A. Arthur with his salmon rod landing twenty and even thirty-pound fish. The rod was not burdensome, but the face of the President—that was to be—was disfigured by a malignant carbuncle, the burnings of which none but a true sportsman with a lion heart could have "endured without a groan," and—kept on fishing.—SPECIAL.

BROTHER STITES.—A man who calls himself "Brother Page Stites," at Schellinger's Landing, near Cape May, has issued a card that reads thus:

"If you have been wishing
For to go a fishing
Take the cars for Sewell's Point,
Where you will find in waiting
Hook and lines and baiting,
And ask for Brother Page Stites
Who will take you where you
Can yank 'em."

SHEEPSHEAD ON LONG ISLAND.—West Hampton, L. I. L., July 15.—Four sheepshead were caught in Shinnecock inlet, with a seine, about four weeks ago. In the same haul were caught nineteen striped bass, and 125 bluefish. Bay snipe have not made their appearance here yet to any extent. —BAY SNIPE.

ONE THOUSAND BASS.—Philadelphia, July 21.—The Presbyterian Fishing Club caught 1,000 sea bass last Wednesday on the Fishing Banks off Cape May, N. J. Dr. Moffatt, one of the leading spirits of the organization, says it was the best fishing he ever had.—HOMO.

Fishculture.

NATURAL CAUSES INFLUENCING THE MOVEMENTS OF FISH IN RIVERS.

[A paper read before the American Fishcultural Association.]

BY MARSHALL M'DONALD.

IF we will consider for a moment the varieties of conditions that concur in and modify agricultural production we will be better prepared to appreciate the multiple influences that enter into the question of maintaining and increasing the production of our fisheries.

The farmer of to-day has as a guide in the conduct of the practical operations of agriculture, the collective experience of all who have preceded him. The observations of many generations condensed in proverb and apothegm, and handed down from father to son, gives to the unlettered peasant the interpretation of natural signs, the forecast of seasons and the empirical rules by which he tills and sows and garners the unequal harvests, which the unequal seasons bring.

Less than a century ago, chemistry allying herself with agriculture, laid the foundation of rational methods and since then chemists and botanists, physicists and physiologists, have been busy with their investigations, each contributing in some essential particular to the solution of the important problem of increasing and maintaining the fertility of the soil.

In those countries, like England for example, where the results of scientific investigations have been formulated into rules of practice, the average production of cereals per acre, now exceeds two-fold, and often three-fold, the average production per acre two hundred years ago.

This result has been accomplished in the face of an intensive system of cropping which long ago would have rendered the fertile fields of England unproductive moorlands, or barren wastes, but for the lessons taught by chemists in its applications to agriculture, and appropriated and applied in practice.

Just in proportion as man has learned to dominate the conditions which influence agricultural production, he has been enabled to raise the average yield per acre; but, unequalities of production from year to year, resulting from the influence of natural conditions beyond his control, still persist.

Confronted with those adverse influences, all the toil of the husbandman, all his stores of experience, all the resources of science, are powerless to avert scanty harvests, or absolute failure of crops.

What is true of agriculture is equally true of aquiculture, and more particularly of pisciculture in rivers.

The restoration and maintenance of our river fisheries depends upon our ability to promote conditions favorable to production and exclude those which are adverse.

First—The seed of the future harvest must be sown. Where, in consequence of the interference of man by excessive fishing, or by the destruction of spawning grounds, natural agencies are inadequate to produce the young fish in numbers sufficient to repair the inroads made by capture or by natural casualties, we must supply the deficiency by artificial propagation.

But the breeding and planting of shad or herring by the million or tens of millions, in an area like the Potomac or the James or the Susquehannah rivers, cannot carry the annual product of the fisheries in these rivers beyond a certain maximum limit, which is defined first, by the extent of the breeding and feeding area acceptable to the fish, and second by the abundance of food for the fry which is to be found in this area.

Second—The extension of the breeding and feeding areas to their natural limits, by providing practicable passes for our anadromous fishes over the artificial or natural obstructions which have contracted these areas, is a second essential condition to be fulifilled, and is one of equal or even greater importance than the artificial propagation and planting of the fry, because it is possible by this means to secure the permanent restoration of our river fisheries under natural conditions.

A third condition, exercising an important influence upon the permanence of our river fisheries, has only recently attracted attention and offers an inviting and important field of investigation.

We may plant the young of shad or herring in our rivers in countless millions, we may extend the breeding and feeding areas to their natural limits, but if the agency of man has so modified the natural conditions that the proper food of the young fish during their river life is no longer found, or occurs in much less than the necessary abundance, then the effort to increase supply by artificial propagation and planting will prove a dismal failure.

How far the pollution of our rivers by sewerage, gas tar, refuse chemical products, etc., has changed the original conditions of our rivers, is a matter inviting exhaustive and critical investigation.

Fourth—A rational code of laws, relating to the fisheries, may exert an important conservative influence, by imposing such restrictions upon the time and methods of capture, as will permit some considerable portion of the shad and herring which enter our rivers to reach their spawning grounds and deposit their eggs without molestation.

By the observance and enforcement of the conditions above indicated, we may reasonably expect to greatly increase the average annual production of our river fisheries, but we can never hope to eliminate great unequalities in the product of the fisheries in different seasons.

Natural conditions, apparently beyond the control of man, will determine disastrous and discouraging failures one season and the next a teeming abundance in the same river.

The influence of water temperatures, in determining the presence or absence of certain species of fish in certain areas of water, has been observed both in regard to the ocean and the river species which are the object of commercial fisheries. Observation of water temperature and its relations to the migrations of fish have not been continued long enough to justify us in formulating conclusions, but the drift of investigation and observations goes to show that there is for each pecies a normal temperature in which it prefers to be, and that its migrations are determined by the shifting of these areas of congenial temperature under the influence of the seasons.

Observations, now continued for several years, have led to the conclusion that, in the case of the shad, the normal temperature, toward which it is ever moving, is about 60 degrees Fahr. The data upon which this conclusion is based are as follows:

First—The shad make their appearance in the St. Johns River, Florida, as soon as the temperature of the river falls to 60 degrees, or thereabouts, which takes place from the middle of November to the 1st of December. At this time the river is colder than the ocean plateau outside, and the movement or migration is from warmer to cooler areas in the direction of the normal temperature of 60 degrees.

Second—The shad which are spawned in the Potomac in April, May and June remain in the river all summer. Schools of them may be frequently seen in the river in front of Washington. They continue abundant until the latter part of October or 1st of November. When the temperature falls below 60 degrees, they begin to drop down the river in their migrations seaward. In this case they are moving from cooler to warmer waters and toward the normal temperature of 60 degrees.

Third—The beginning of the spring run of shad into the Potomac River is about coincident with the date when the river temperature rises above that of Chesapeake Bay. In this case, too, the shad are moving from cooler to warmer waters, and in the direction of the normal temperature of 60 degrees, for the temperature of both bay and river is at the beginning of the season always below 60 degrees.

It will be seen, therefore, that wherever we have been able to intercept the shad in its migrations and place it under observation, it is always moving in the direction of the normal temperature of 60 degrees.

Assuming it to be true as a general fact that the shad in their ordinary migrations are ever traveling on temperature paths which lead to the normal temperature of 60 degrees, it becomes possible to determine the law, the rate, and the limit of their movements in a certain area, by tracing the shifting of the areas of congenial temperature under the influence of the seasons.

The data for the discussion are furnished by the records of observations of water temperatures, made at the lighthouses by the direction of the Lighthouse Board, and at Washington by an employe of the U. S. Fish Commission.

The three stations selected for comparison of ocean, bay and river temperature are (1) Winter Quarter Shoals for the ocean plateau, (2) Wolf-trap Light for Chesapeake Bay, and (3) Washington, D. C., for the Potomac River.

The station at Winter Quarter Shoals is up the coast about forty miles north of Cape Charles, and is about eight miles from shore. It is close to the edge of that cold Arctic current which wedges itself down between the Gulf Stream and the shore, and, bringing with it the temperature of Arctic latitudes, builds a wall of minimum temperature beyond which the shad probably never pass in their migrations.

The only records of bay temperature available for the season of 1881 were the signal service observations in Norfolk Harbor. These records, which give the temperature of Elizabeth River rather than the bay, indicate more rapid fluctuations than is possible in the general temperature of the bay, and give a daily range of temperature several degrees higher than that of the bay.

This correction I have approximately applied in the discussion of the temperature observations of 1881, in order to bring them into harmony with the observations of bay temperature for 1882 and 1883, which were made by observers at Wolf-trap Light.

This locality is on the west shore of the bay, half way between the Rappahannock and York rivers, and being well off from the shore, little influenced by local variations, the temperatures taken here may therefore be taken to represent the general temperature of the bay waters for corresponding dates.

The result of the study of the data above indicated are graphically presented in three outline maps of the Chesapeake and Delaware basins, illustrating the movements of the areas of congenial temperatures under the influence of the seasons, and in the chart showing the relations between the temperatures of the Potomic River during the fishing seasons of 1881, 1882 and 1883, and the fluctuations in the shad fisheries of the river for the same period.

(The rest of Col. McDonald's remarks were oral and with reference to the maps and charts exhibited.)

The conclusions deducted by him from the discussion of the data presented were as follows:

The temperature records for 1881, '82 and '83 indicate that for the winter months the area of maximum temperature is not in the rivers or in the bay, but on that ocean plateau outside, extending from the capes of the Chesapeake to the Delaware breakwater. The presumption, therefore, is that the schools of shad belonging both to the Chesapeake and the Delaware, have their common winter quarters on this plateau. When under the influence of the advancing seasons the waters of the Chesapeake and the Delaware Bays become warmer than on this plateau, the migrations into continental waters begin. The proportion of the entire run that will be directed to the Delaware or the Chesapeake, will be determined at this time. If the northern end of the area warms up more rapidly than the southern, then an unusual proportion of the shad will be thrown into the Delaware. On the other hand, cold waters coming down the Delaware, may effect a contrary movement, and throw the schools of shad almost entirely into the Chesapeake; thus leading to a partial or total failure of the shad fisheries of the Delaware for the season.

When the schools of shad have entered the Chesapeake, their distribution to the rivers will be determined in the same way by temperature influences operating. If the season is backward, so as to keep down the temperature of the larger rivers which head back in the mountains, then the run of shad will be mainly into the shorter tributaries of the bay, which have their rise in the tide-water belt, and which, of course, are warmer at this season than the main rivers.

Again, warm rains at the beginning of the fishing season in our large rivers and the absence of snow in the mountains will determine the main movement of the shad into the larger rivers of the basin; and if, when the schools enter the estuaries of these rivers, they encounter a temperature considerably higher than that in the bay itself, the movement up the river will be tumultous; the schools of shad and herring all entering and ascending all at once, producing a glut in the fisheries such as we sometimes have recorded.

It follows, therefore, in the light of these facts, that we may have a successful fishing on the Delaware accompanied by a total or partial failure in the Chesapeake area, and *vice versa;* and considering the Chesapeake area alone, we may have a very successful fishery in the aggregate, yet accompanied by partial or total failure in particular streams under the influence of temperature conditions, as above indicated. Statistics of the shad fishery, if they are to furnish a measure of increase or decrease, must include the aggregate catch of the Chesapeake and Delaware River, and indeed of the rivers much further to the north. Statistics based upon a comparison of the catch in the same river in different seasons, are of no value as serving to give a measure of the results of artificial propagation.

A WATER SNAKE KILLED BY A CARP.—(From a letter to Prof. S. F. Baird, by Milton P. Peirce).—Philadelphia, Pa., May 14.—The following very singular incident has just been related to me by the owner of some carp ponds in Southern New Jersey, and it occurs to me to forward it. A gentleman was sitting upon the bank of the pond with a gun,

watching for snakes. Suddenly there was great commotion in the water near by, which he soon discovered was caused by a large carp. The water being quite clear and shallow he could see what appeared to be a large water snake hanging to the anal fin. The fish moved with great rapidity in various directions as if endeavoring to free itself from the snake. After a while its movements became spasmodic, for a time rapid and then slow. Finally the fish passed slowly near the water's edge and close to the gentleman, who discovered that instead of the snake having hold of the fin that it was itself clasped under the fin some three inches back of its head and was apparently nearly lifeless, though a short time before there was a lively writhing action of the tail. The gentleman now went to dinner but returned as soon as practicable to further observe if possible the strange aquatic episode. All was quiet, but he soon found a dead snake at the water's edge, with distinctly perceptible lacerations about three inches back of its head. Who will say that the carp is not a "game fish?" The serrated process or "strong ray," seems to have its uses besides that of tangling a net.

FIXTURES.

BENCH SHOWS.

Sept. 1 to 6.—Bench Show of the Lancaster County Fair, Lancaster, Pa.

Sept. 9, 10 and 11.—Third Annual Bench Show of the Montreal Kennel Club. Chas. Lincoln, Superintendent. John F. Campbell, Secretary, P. O. Drawer 1,955, Montreal, Canada.

Sept. 16, 17 and 18.—Collie Bench Show and Field Trials of the Ontario Collie Club, Toronto, Ont. Entries close Aug. 23. Mr. H. J. Hill, Secretary, Toronto.

Sept. 16, 17, 18 and 19.—Bench Show of the Philadelphia Kennel Club. Chas. Lincoln, Superintendent. Mr. Benj. C. Satterthwaite, Secretary.

Oct. 8, 9, 10 and 11.—Third Annual Bench Show of the Danbury Agricultural Society, Danbury, Conn. E. S. Davis, Superintendent, Danbury, Conn.

Oct. 21, 22, 23 and 24.—First Annual Fall Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Chas. Lincoln, Superintendent.

FIELD TRIALS.

Dec. 8.—Sixth Annual Trials of the National American Kennel Club at Canton, Miss. D. Bryson, Secretary, Memphis, Tenn.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1407.** Volume I., bound in cloth, sent postpaid, $1.50.

POINTERS AT NEW YORK.

Editor Forest and Stream:

Mr. Wanmaker's reckless letter in your last number is not likely to benefit him or weaken my position. I can assure Mr. Wanmaker that I excuse the tone which pervades his communication, but in the future I would advise him to think (if he ever does think) before he sends such an illogical and untrustworthy production to a public paper. Thunder was not introduced into this discussion by me, he was resuscitated by Mr. Tracy. I even apologized for having to trespass on your space to reply. The discussion was of the relative merits of certain pointers, not of Thunder or lightning, neither of which, or both combined, can affect the issue. CHAS. H. MASON.

Editor Forest and Stream:

The pointer breeders who own descendants of old Lily, wait to hear from Mr. J. W. Munson. T. B. DORSEY.

ELLICOTT CITY, Md., July 21.

COLLIE SHOW AND FIELD TRIALS.

THE Ontario Collie Club will hold a bench show and field trials of collies at Toronto, Ontario, Sept. 16, 17 and 18, in connection with the industrial fair. We have no doubt that the affair will be successful. Following is the bench show premium list: Champion, rough-coated, dogs $10; bitches the same; open, dogs $15, $10 and $5; bitches the same; puppies $5. Champion, smooth and medium coated, dogs $10; bitches the same; open, same as rough-coated. Animals to compete in the champion classes must have won first at the Toronto, Ottawa, London, New York, Cincinnati, Philadelphia, Chicago or Cleveland shows. The field trials will take place between the hours of 3 and 4 o'clock each day. The dogs will be required to take their sheep between two posts and back to a pen, or such trial as the judges may decide on. The prizes offered are as follows: Dogs, $25, $15 and $8; bitches the same. We hope that all of our prominent breeders will send representatives from their kennels to compete in both events. Entries close Aug. 23. Blanks may be obtained by addressing Mr. H. J. Hill, secretary, Toronto, Ontario, or at office of FOREST AND STREAM.

THE LAVERACK SETTERS.

Editor Forest and Stream:

I am mystified by "Homo's" article on the Laverack setter in your last issue. I quote and comment on some of the more emphatic passages:

"It would seem that Mr. Laverack, jealous of the high standard he had attained in breeding his dogs and anxious that his setters should still hold the position they had gained under his management, overstepped the limit and continued his inbreeding to such an extent that where he improved their wonderful scenting power and more firmly stamped their natural tendency to find and point game, he multiplied that nervousness to which all inbred animals are prone, until shyness of the gun has become such a part of the nature of the breed that it is an exception to the rule when the timidity in this particular does not show itself." * * * "So marked has this peculiarity shown itself to me that I detect it most frequently (far too often) in the field trial or Llewellin breed of setters, or where there is a preponderance of Laverack blood in them, and they show the typical points of the older breed. While the Laverack setter is apparently courageous when allowed his own way in pursuit of game and self-willed in his method, he will bear no correction. It becomes then a most difficult task even with the cord to train him to obedience, or by taking advantage of his affections to guide him as he should go. In all the setters of this breed that I have owned or ever saw there seems to be a want of knowledge on their part that their powers should be coupled with those of their master in order to render themselves useful."

Further on in his article he says: "In the stud they are priceless, in the field useless," and winds up by saying, "We must use the Laverack setter to improve our native stock, and for this purpose they will be most useful."

From the foregoing, if "Homo" is correct in his premises, the Laverack is the embodiment of all that is worthless in a field dog, an unmitigated brute, stupid, nervous, game and gunshy, earning the whip at every turn, yet too cowardly to bear chastisement, a cowering, skulking wretch. And yet this dog is priceless in the stud, though useless in the field.

Like will beget like, this is a well established law in breeding and every stock breeder of experience admits the soundness of that other law in breeding, viz.: that inbred sires are prepotent in transmitting their moral and physical characteristics to their progeny, overwhelming, so to speak, the weaker individuality of the dam. Therefore the inbred Laverack sire is either a dangerous or useless factor in setter breeding. If the law of heredity is carried out his produce will resemble him in morale and like him be useless in the field; if on the other hand they take after the dam, and notwithstanding their Laverack sire they prove good field dogs, then he is shown to be a complete nonentity, subject to no known law, an incestuous abortion. RUSTICUS.

CRYSTAL PALACE BENCH SHOW.

[From our Regular Correspondent.]

UPON the grounds of the Crystal Palace the Kennel Club held their twenty-third exhibition of sporting and non-sporting dogs, on July 1, 2, 3 and 4. The total number of entries as per catalogue was 1,286, which, of course, included double entries, nearly 200 in number. The benching, as usual, was done by Spratt's Patent, and the tents were also supplied by the same firm. During the show the weather was warmer than any we have had previously this season. The attendance was only moderate, but, taken altogether, the show was a very good one and the quality good throughout.

BLOODHOUNDS.

There was a small collection of nine entries in the three bloodhound classes, the well-known Nestor winning first in champion, having no competitor. In the open dog class, first again went to Triumph, who was followed by Mr. Tinker's Duncan, who is well on his feet and legs and a good color, but lacks the grand head qualities of Triumph, the winner. Only three bitches were shown, Mr. Nichols winning first and second with Pattie and Phryne, both good ones.

MASTIFFS.

Champion Cardinal got only vhc. He was not looking as well as when he was at Warwick. First and the 40-guinea challenge prize went to Crown Prince, looking well. Rosalind, belonging to the same kennel, winning first in champion bitches. The open dog class was a good collection, Maximilian, late Hampton, who made his first appearance last November at Edinburgh, made his appearance here greatly improved on his old form, and won first and the 5-guinea prize for the best mastiff in the open classes, and also secured a 5-guinea cup for Mr. Woolmore as the breeder of the best mastiff under two years old. Moses, second prize, is much improved since Warwick. Rudolph, third, is good in body but his ears are not correctly carried and his eye is against him; in fact, we preferred the vhc. Bismark, and think he ought to have been further up in the prize list. Dictator, fourth, has good head, feet and legs. He will never be a large one and is very coarse in coat and in color, but is only ten months old at present, and of course may improve, he won first in puppies. There was a very strong class of bitches, the best seen for years. First went to Elaine. She is small but of good type, and well shown; she also won special for the best bitch in the show. Vixen, vhc., is larger in ear than the winner, and is not so good in color. She is also slacker behind the shoulder and not so well made up or furnished. Lady Ella, second, is a good bitch, larger and not exactly of the same type as the winner. Lorna Doone, the same type as the winner, but not in as good condition, won third, and was claimed at the catalogue price. Princess Ida, vhc., is leggy, light of bone, long of face, and narrow skull. There were only six entries in the two classes for brindles, and with the exception of the first prize bitch Lily II., we saw nothing fit to compete against the fawns. In mastiff puppies (dogs), first went to Dictator, fourth in the open dog class. Second to The Doctor, only a moderate specimen. In bitch puppies, Princess Rita, first, is small but of good type. Second went to Princess Ida, shown in the open class.

ST. BERNARDS.

The champion class had five entries, but the competition really lay between Bayard and Save, the former being better in muzzle and having dew claws, won, but as Save is so much his superior in every other point we would have had no hesitation in giving him first. In champion bitches, first went to Cloister, who was looking remarkably well and won quite easily. In the open class for dogs (rough-coated) Silver King, vhc., is very large, but a cripple behind. Leonard, in most perfect condition, won somewhat easy; he also won the challenge prize, beating Bayard, and the decision seemed to give general satisfaction. Gaylord, vhc., is a good type of dog, with good color and markings, but out of form, and we don't fancy his coat. Correze, fourth prize, has a good head and good color, but is small and short of bone. Plinlimmon, second prize, is a remarkably large dog of his age, which was one day too old for a puppy; he has greatly improved since we saw him at Warwick; he is still too long in face and large of ear, nevertheless he is so good in size, feet, legs, coat and color that we consider him a dog likely to be hard to beat should nothing happen to him. Valentine, third, was about the most typical dog in the class. He was not in full coat. In bitches (rough-coated) Briseis, the fourth prize, had bad ears and bad coat, and stands too high on her legs. Khiva, vhc., is a good stamp and well known. She shows age. Seiva, second, is a good bitch all through and deserved her position. Crevasse II., first and cup, never looked better. In smooth dogs Mr. Murchison won first and second with Sirius and Dignity, correctly placed. The former has improved since we last saw him, while the latter has altered in no way. In smooth bitches Her Majesty, well-known, won well. Bon Bon, second, is another good bitch of good color (brindle) and markings. In puppies, dogs, (rough) Beaulieu, first, is a good puppy with no dew claws. Leicester Lion, second, is a good young one, but is too long in face. In the corresponding class for bitch puppies, Thisbe, hc. in open class, won, closely pressed by the second prize winner. In the class for smooth-coated puppies, first went to Brennus, a very nice young dog and cheap of his price, £20. He was claimed by the owner of Leonard, his dam won second in smooth bitches.

NEWFOUNDLANDS.

Nelson I. won again in the champion class, he is well-known. Trafalgar had an easy win in the class other than black. In the open dog class Bruce II. was first and no doubt deserved the position, but we fancied the c., King Bruce, equally as much as any of the others.

GREAT DANES OR BOARHOUNDS

were one of the best if not the best class in the show. It is really surprising to note the improvement that this breed has undergone within this last few years. Mr. Onderwater, of Holland, exhibited several very good animals, among which were a pair of white ones. They were fairly good animals, but quite out-classed by the quality against them. Champion Sultan II. had the champion class to himself, but was afterward beaten by Cedric the Saxon for the challenge prize, and as grand a dog as Sultan II. is he was correctly beaten, if the unanimous voice of exhibitors goes for anything. Nero, the winner at Warwick, came second in the open dog class. Mr. Onderwater's Victor, a grand brindle with the best of feet and legs, lots of muscle and the best of movers, showing great quality for the amount of substance he possesses, came third. Bitches were equally as good as the dogs and any of the noticed ones are fit to show and win. The winners will require a lot of beating and we have no doubt but there will be some hundreds bred before they will have their colors lowered.

DEERHOUNDS.

Lord of the Isles won in the champion class. He seemed scarcely as full of go as we have seen him. Chieftain was absent on this occasion. Gunner, first in open dogs, has good bone. He stands a trifle low on leg. Sir Max, second, does not move so well. The well-known Minna won in bitches. She was looking well. Mr. Taunton, as usual, made a wonderful display in the foreign classes, all of which, with the exception of Sir John Franklin in the champion class, were entered not for competition.

GREYHOUNDS.

The dogs had only three entries, first and second going to the well-known Memnon and Whiskedale II. Bonny Lass, from the same kennel, looking well, won in bitches, followed by a good lemon and white bitch, which would be improved by a little more condition.

HARRIERS.

There was only one pair entered.

BEAGLES.

There were eight entries, two of them being absent. Sportsman II., unnoticed, is small, thick and cobby. Honesty II., pedigree unknown, vhc. and reserve, is a fair specimen. Myrtle, first, is good. She was closely pressed by Freeland Countess, the second prize.

POINTERS.

Graphic, looking well, won with no competition in the champion class. The bitch class had four entries, Beryl absent. Daphne was rather heavy in flesh. Belle of Bow, in good form, won. Young Dick, first in open class over 55 pounds, is a good dog, but rather coarse. Belhus Hector, equal second with Grandee, is not quite good in head, while Grandee shows great quality, but falls off in his loins. Devon III., second prize, is coarse and throaty. Earl of Croxteth should have been mentioned. Mr. Norrish won well in large-sized bitches with Revel III., second going to Nan, too long and fine in face with too light an eye. We think Peach, third, should have occupied that position. In dogs under 55 pounds Naso of Kipping won; he is rather light in eye; he was closely pressed by Donald III. Third, Sir Garnet, is rather light of bone in hocks. In bitches under 40 pounds Mr. Norrish was again to the front with Beau Ideal, the York winner. Zasme, second prize, is light in bone. Jetsam, third, is a fair good black bitch, with litter sister Flotsam unnoticed, but worth a card. There was nothing really first-class in puppies.

ENGLISH SETTERS.

Sting, reported upon at Warwick and York, had little difficulty in disposing of Sir Alister, who is decidedly coarse in head and too heavy in ears, a fault which is very noticeable in his stock. In open dogs Prince Fred, first, is a liver and white with fair head, but too long in body and slack behind shoulder. He is a bad mover and too short of coat on body. Sir Kent, second, is of better type. He is a trifle high on leg. Sir Colin, third, is rather coarse in head and heavy in ears. Lord Westmoreland, unnoticed, was shown too heavy in flesh. He is plain in head, otherwise we consider him and Glencairn, hc., the two best in the class. In the bitch class first went to Plimsey, the York winner, shown in the best of condition. Rose, second, is anything but a show bitch. In puppies we preferred the second prize winner to the first, and only for the low condition of the vhc. Blue Peter II. we think him about the best in the class.

BLACK AND TAN SETTERS

were well represented but the quality was only moderate; we can see no improvement in this variety.

IRISH SETTERS.

Garryowen, looking well, won in champion class, with nothing against him, Geraldine winning in the corresponding bitch class. In open dogs, first went to Tyrone, a good, strong dog, lacking the quality of the true red setter. The second and third prize dogs were nothing above the average. The bitches were better in quality. Frya, third, is of good type but short in coat. Ruby VII., vhc., was out of form, as also was Nellie III. First went to the well-known Lady Palmerston. She was in good condition. The winning puppy was a promising young one but quite too young to show.

COLLIES

were good classes and we never remember hearing so much satisfaction expressed by exhibitors; every person seemed to think the awards were correct and satisfactory. Charlemagne won quite easily in champions from Eclipse, Peggie II. winning in bitches with nothing against her. In the open dog class the black and white Sly Fox won. He is a good dog, but would be improved with more frill and a better texture of coat. Kintore, the York winner, sadly out of form since then, coming second, and another of the blueish gray color third; this dog is particularly good in face, frill, coat and ears, which are properly carried, but we don't like his quarters or carriage of tail. The Squire, vhc., is leggy and out of coat. Charlatan, fifth, is fine of bone. General McPherson, fourth, wants more coat and better texture. Collie bitches introduced us to Lady of the Lake, one of the best young ones we have ever seen. She was an easy winner and won the special for the best bitch in the open class and first prize in bitch puppies; second, Mistress Beatrix, the winner at York, was an easy second; third, Young Meg, is short of under coat and carries her tail rather high, otherwise she is a good collie. Lady Lorne, fourth prize, is black, tan and white, fine in coat, but small in face and a trifle coarse in shoulders; fifth prize, Plaidie, is a black and white, short of coat. The Lily, vhc., is light in bone and short of coat. In champion smooth, Sattie was in bad form and Lady had an easy win; Clyde won well in smooth dogs. Gazelle, who won second, has ears *à la* fox-terrier. Nullamore, second in dog puppies, is a good specimen, sable tan in color. General McPherson, third, was fourth in the open class. Kintore, first, was second in the open class. Bitch puppies, except the winner, were moderate. The collie derby was won by Lady of the Lake, second going to Kintore.

BASSET HOUNDS.

There were four classes with a total entry of thirteen, six of which were Mr. Krehl's and three Mr. Blain's. The winners were all good ones and well known.

DALMATIANS

had five entries; only two put in an appearance—Treasure and Nelson, both well known.

POMERANIANS.

First went to the black dog Scoff, well known, who was looking better than usual. Second went to the equally well-known white Charlie.

POODLES

were a really good class. Lyris, who won first in the open class, is a clinking good black, as also was Boy, the second prize winner. The well-known Fairy Queen, with her long, white cords, much longer than herself, won third. The class was a remarkably good one.

BULLDOGS.

In the champion large class, Taurus won; in champion class for dogs under 60 pounds and bitches under 50 pounds, Monarch and Britomartis were not to be denied. In the open class for large-size dogs and bitches, Big Ben won well. In dogs under 60 pounds, the York winner once more came to the front. He is own brother to Britomartis, and resembles her very much. In fact we consider him about the best in head of any bulldog we know. He has immense chop and good expression. Bessie, vhc., is too leggy. Castor, also vhc., is too bullet-headed. Cossack, second, has drop ears which are rather large, and we certainly think the third prize, Black Prince, ought to have been second, although he might be shorter in barrel. In bull bitches not exceeding 50 pounds Acme, first, is a very good one. Ariel, second, who is in whelp, is also a good one, brindle smut in color. Third, Scissors, is too light in bone. In small-sized dogs first went to Royal George; he has a brindle head and

white body; he is too leggy; we preferred Bacchus II., who won second, a white dog with marked ears. Sedan, third, is leggy and light of bone. In small bitches Jenny Howlett II., first, won well, with the second and third correctly placed. Ridotto, vhc., is a nice little bitch; she might be better shown; she is a trifle long in ear. There was nothing special in puppies.

IRISH WATER SPANIELS.

In dogs first went to Blair, winner at the last Dublin show. He was correctly placed, but was not in the best of trim. Mickey Free was second. Barney O'Toole is rather coarse in head and deficient in feather. In bitches Young Hilda and Lady were placed equal. It has always been a matter of opinion which of these should be first; we prefer Young Hilda.

CLUMBER SPANIELS.

The champion class had only one entry, the well-known Psycho, who shows age. He was claimed at his catalogue price, £15 15s., and now goes to Wales. In open dogs Boss III. won, owing to his condition. He is plain in head. Duke, vhc. reserve, is of better type but was badly shown. In bitches, Foxey Beauty and Rose III. were equal first and second, the former was looking well, the latter in bad condition.

LIVER OR SUSSEX SPANIELS.

Harvester, unnoticed, is a good spaniel, but with wrong type of head for a liver or Sussex. Guy, first, we consider the best of the class going at the present time. Bachelor III., who won third, is coarse and has bad eyes. Horatio, second, is leggy and short of coat. In bitches Aureola, second, is out at shoulders. The third prize, Petrel, has the same fault. Brida II., placed first, was much the best, and possessed good color and coat. Easten's Bee is not of Sussex type.

FIELD SPANIELS.

Solus and Squaw very properly divided the champion prize. In the open class for blacks. Newton Abbot Nigger is of good stamp and a good dog, with rather crooked legs. Easten's Bracken, third, is coarse in head and has bad eyes. Lord Bute, second, is also coarse in head and short of feather. Castle Raven, vhc. reserved, is leggy and short in head. In bitches Easten's Busy, second, a long, low and good specimen, is improving. Newton Abbot Bess, first, long and low, with a good coat and a fair head. Alva, Jet and Thyra we fancied as much as any in the class. Only for white on the former we consider her the best we know. In cocker dogs there were only two entries, and neither of them cockers. In bitches first went to Dolly Obo, a clinker. Lilac, vhc., ought to have been second. In cockers (dogs) other than liver and black, all were field spaniels, not cockers. In the corresponding bitch class Zuess, second, was short of feather. Fanciful, first, has a short, round head. She is good in coat and feather; black, white and tan in color.

FOX-TERRIERS.

In champion fox-terrier dogs, first went to Spice, who was looking well, Sutton Veda winning in champion bitches, with Diana second. In the open class for dogs, first went to a young dog, Result, with a heavily marked head. He was bred from a brother and sister, and a grand result it has been. We consider him the best we have seen since Buffet first came out. He also won the grand challenge cup, beating Spice and Sutton Veda, and the decision was pretty well indorsed. He also won a special 5-guinea and another 10-guinea cup, presented by the Fox-Terrier Club. Hognaston Rebel made a good second. Nothing extra turned up in bitches, the winner is too much of a toy and not enough terrier. Had she been placed in the list of the he.'s, the other awards would have done. The second prize, Nettle, is a good one, and the third, Poppy II., a puppy, is also a fairly good one. She is a trifle large in ear and fine in muzzle, otherwise a good terrier. She won first in bitch puppies. The Right Hon. Earl of Lonsdale won in wire-haired champions, with the well-known Briggs, and first and second in champion bitches, with Miss Miggs and Vora, and again in open dogs, with Lord Randolph. He is a good sort, but rather soft in coat for a wire-haired. We prefer Jack Frost, the second prize dog, who also won first in puppies, with the vhc. and reserve Ringleader second to him. Taken altogether the wire-haired terriers are improving, except in coat, and we think they are losing one of the most valuable and characteristic points of the breed.

BULL-TERRIERS.

Cairo once more came to the front in the champion class. In open dogs Count won somewhat easy. Murderer, second, is rather coarse in head, and Crown Prince, third, is shelly in body. In bitches, Maggie, first, is a good-bodied bitch; she might be longer in face. Maggie May, second, is long in face but too high on her legs. In the medium class the third prize, Dutchman, is light in body. Grand Duchess, first, is light all through; we preferred Nelson, second, who may be a little too strong in head. In the small class Quick was an ounce over weight in the ring. When weighed the night before he was one-half pound under, so some kind friend evidently fed him before the judging, otherwise he no doubt would have won. Pearly was also over weight. The winners were only moderate specimens.

AIREDALES.

First and second prizes were awarded to the two largest and coarsest dogs in the class. We consider the third prize, Fritz, worth all the others.

BEDLINGTONS.

Mr. Batty had things mostly all his own way. In champions, Dina beat Topsy, owing to the condition of the latter. In the open class, Sentinel, vhc., is too light in color for his age, 10 months. The well-known Tinner was here unnoticed, Randolph, vhc., is a light blue. He is undershot and has bad quarters. Hairdresser, second prize, is of good color and coat, and a good dog. First was won by the well-known Lord Stowell. Scotch Mist, third, is a good one and will improve. Vhc., Bishop, is good but coarse. In bitches, Lass, first, has a good head but is leggy. Daffodil, second, is a liver, a well-known good one. Salters, unnoticed, is as good as any, but was badly shown. Violet, vhc., was another good one shown badly. In dogs and bitches that never won a prize, first went to Scotch Mist, third in open class. Sentinel won in puppies, followed by Julius Cæsar, who is good in style and the best color.

IRISH TERRIERS.

In champion dogs first went to Playboy who had no competitor. In bitches Poppy was absent, and Sting looking well, won. In open dogs first went to the York winner, Gilford, who also won in the puppy class. In bitches we preferred Pretty Lass to the winner, who was claimed at the catalogue price, £10, so evidently the judge thought more of her than her owner. The puppies, except the winner, were a moderate lot.

BLACK AND TAN TERRIERS.

In the champion class first went to Wallace, who was too heavy in flesh, we preferred Burke, who was in better form; however, the judge thought different and said that Burke was too thin. Florence III., unnoticed in open class, we thought should have been second. Nellie, who won first, is plain in head and has no feet markings. Robin Hood, second, is rather too large. Welfare, hc., we would have put second and Robin Hood first, the remainder were a poor lot. In the class under 16 pounds, Streamlet, first, had an easy win. Harvester, second, is dished in face; Sissy, third, should have been second, and we would have put her first in puppies where she only got hc. Sir Wilfred, the second prize puppy, has a bad eye and is leggy. Harvester, first, was second in the open class, he should have been second here with, as we said before, Sissy II. first.

SKYE TERRIERS

were a good collection, Mr. Pratt, the judge, showing a grand team, entered not for competition. In the champion class for dogs there were three entries, and bitches had two, all bred by the judge, and good specimens. In the open class for dogs we preferred the second prize to the winner. The first prize bitch is a rare good one; she might be better in head.

HARD-HAIRED SCOTCH.

The hard-haired Scotch were a good collection and pretty well handled. We missed Capt. Mackey's dogs on this occasion.

DANDIE DINMONTS

were also a good collection, Astrologer winning well in champion dogs. There was only one entry in the bitch class, Jennie Deans, who no doubt frightened away the others eligible to compete. In open dogs Mr. Ball's Roderick, not in as good bloom as we have seen him, had to stand back before Tip, who was cheap at his price, £25. Lochinvar, whose name has been so much before the public since the last Hertford show, got vhc. and reserve, also special for best mustard colored dog or bitch. In open bitch class Hannah and Queen Mary were first and second. The latter was heavy in whelp or she might have been a step higher. There was nothing special behind them.

PUGS

came out in good force. Stingo Sniffles, well-known, beat Challenger in champions, Jenny winning in champion bitches, with nothing against her. In open dogs Bradford Ruby was first, and correctly so, being good in marking, good ears and tail, and cobby. His only drawback is light-colored toe nails, which is generally the case when distinctly marked every way else. The bitches were a good class, all the noticed ones being quite up to show form. Puppies were a rather large class. They are bad to judge as they alter so much.

MALTESE.

Lady Giffard, as usual, had the whole class to herself, and they were quite a show in themselves.

BLENHEIMS

made a good show; most of the winners were conspicuous for having no spot, otherwise they seemed good, with large skulls and good eyes.

KING CHARLES SPANIELS.

Mrs. Buggs had everything mostly her own way, Mr. Forder coming second with Jumbo II.; rather larger and darker in tan than Bend Or or Young Prince.

There was only one entry in Italian greyhounds.

TOY DOGS.

In rough toys, champion class, Mr. Tronghear had an easy win over Mr. Foster's pair. In smooth toys there was keener competition than we have seen for some time. However, Sibyl won well, being the best in face, a thing so difficult to get on a toy. Second and third were also fairly good. There was a good class of rough toys, a great many of which changed hands.

CHOW CHOW DOGS.

First went to Chow IV. and second to Chow III. We may remark all these chow chows seemed very much alike, in fact when they are well mixed up it is difficult to tell Chow I. from Chow II.

JAPANESE SPANIELS.

First went to Tokio. He appears to be crossed with King Charles blood, and we preferred any of the others to it, particulary the second prize Chang, which we thought was better in skull and eye, and being pure black and white and free from tan markings. Following is a list of the

AWARDS.

BLOODHOUNDS.—CHAMPION—M. Beaufoy's Nestor.—OPEN—*Dogs:* 1st, E. Nichols's Triumph; 2d, J. C. Tinker's Duncan. *Bitches:* 1st and 2d, E. Nichols's Patti and Phryne; 3d, W. Foster's Duchess of Ripple.

MASTIFFS.—CHAMPION—*Dogs:* 1st, Dr. Forbes-Winslow's Crown Prince; 2d, M. Beaufoy's Pontiff. *Bitches:* 1st, Dr. Forbes-Winslow's Rosalind.—OPEN—OTHER THAN BRINDLE—*Dogs:* 1st and cups 3 and 4, Dr. Forbes-Winslow's Maximilian; 2d, J. Evan's Moses; 3d, J. L. JAPANESE DOGS.—1st, Mrs. V. T. Poynder's Tokio; 2d, Mrs. E. M. Monck's Chang.

SALE OF SPORTING DOGS AT ALDRIDGE'S.

THE fourth sale of the season was held by Messrs. Freeman yesterday, the feature of which was the dispersing of the well-known kennel of pointers belonging to Mr. T. Pilkington, which included the grand old dog Garnet, a pointer who carries his head better than any other pointer in England, and he has carried it to victory more than once both at field trials and on the bench. Mr. Pilkington's dogs are so well known that a large attendance was the consequence at the sale, and prices were good accordingly, as there were those men there whom prices would not stop when the animal in question was the best of its kind. Mr. Barclay Field was a large purchaser, and so was Mr. Haywood Lonsdale, who secured that grand dog Lake at 110gs. Below we give the prices with the names of the purchasers. The whole of the dogs were sold without reserve, with the exception of Laurel, which it was stated would be bought in. Col. Cotes sent to the sale four well-broken, flat-coated retrievers, which did not go above their value. The pick of the basket, in our opinion, being Duck, who Mr. Haywood Lonsdale got for 30gs. Three partly-broken young ones from the same kennel averaged 10gs. each, and there was a rare good one in the lot. A lot of Irish and Laverack setters of fair quality were sent by Mr. T. D. Hine, and mostly went very cheap. Altogether Mr. Farmer disposed of 68 dogs.

MR. PILKINGTON'S POINTERS.

Lot 1, Tory II., Duke of Portland, 25gs.; 2, Guard, Mr. Bristowe, 29gs.; 3, Garnet, Mr. Peters, 36gs.; 4, Druid, Mr. Bristowe, 46gs.; 5, Lake, Mr. B. Field, 61gs.; 6, Dingle, Mr. B. Field, 63gs.; 7, Justice, Mr. Cash, 25gs.; 8, Moffat, Mr. B. Field, 55gs.; 10, Lilac, Mr. B. Field, 61gs.; 11, Peace, Mr. Haywood Lonsdale, 60gs.; 12, Pardon, Mr. B. Field, 56gs.; 13, Lincoln, Mr. B. Field, 57gs.; 14, Lundy, Mr. Bristowe, 46gs.; 15, Lymm, Mr. H. Lonsdale, 110gs.; 16, Lace, Mr. Bristowe, 34gr.; 17, Law, Mr. Sellars, 15gs.; 18, Zeus, Mr. Part, 18gs.; 19, Crozier, Mr. Pleydell, 22gs.

COL. COTES'S RETRIEVERS.

Lot 40, Merle, Lord Alfred Fitzroy, 28gs.; 41, Major, Col. Campbell, 20gs.; 42, Mars, Col. Campbell, 26gs.; 43, Duck, Mr. H. Lonsdale, 30gs.. 44, Magic, Mr. Somervell, 9gs.; 45, Mab, Mr. Sebright, 11gs.; 46, Daphne, Mr. Somervell, 10gs.—*Land and Water, July 5.*

ENGLISH FIELD TRIAL RULES.

AT a meeting of the committee of the National Field Trials, held on June 6, at 23 Grosvenor Square, London, W., A. P. Heywood-Lonsdale, Esq. in the chair, the following resolutions, with a view of strengthening the hands of the judges in the case of disobedient and noisy breakers, and for the protection of those who suffer from the unruly actions of their opponents, were passed, viz.:

1. That at the National Field Trials Meetings of the future the judges be requested by the committee and empowered to first caution, and, upon repetition of the offense, turn out of the stake any breakers not beating the ground to their satisfaction, not keeping together, or outwalking their opponents, or unduly or unnecessarily whistling or shouting, or in any way behaving in such a manner as in the opinion of the judges is detrimental to the chance of success of their opponents; and that it shall be permitted for any breaker or owner feeling himself aggrieved upon any one of these points to request the interference of the judges.

2. That the judges be requested in giving their awards to take into their very serious consideration the manner in which the ground is quartered and beaten, and not to award a prize to any breaker or dog who does not beat his ground and work exactly as he should do were he actually out shooting.

3. That at the National Field Trial Meeting, 1885, a prize of £10 be awarded to the breaker who, in the opinion of the judges, beats his ground in the most sportsmanlike manner.

(Signed) A. P. HEYWOOD-LONSDALE, Chairman.
Samuel Ebrall, Secretary.

[We think the Committee of the National Field Trials have not taken this matter in hand one moment too soon. We have time after time called attention to the manner in which the ground is wasted at field trials, and the "jockeying" that is occasionally practiced is very reprehensible.—ED. L. & W.]—*Land and Water.*

THE PHILADELPHIA DOG SHOW.—The Philadelphia Kennel Club, in connection with the Fair of the Pennsylvania State Agricultural Society, will hold a bench show at Philadelphia on Sept. 16, 17, 18 and 19. Sheep dog trials will also be held at the same time. The premium list, we understand, will be liberal, and a large number of special prizes will be offered. Mr. Charles Lincoln will superintend the show, which is a guarantee that the arrangements will be first-class. We would suggest to English exhibitors who intend sending their entries to the New York show in October that they can also show their dogs at Montreal Sept. 9, 10 and 11 and at the Philadelphia show a week later and then have ample time to get their dogs in condition for New York.

ADDRESS WANTED.—*Editor Forest and Stream:* Can you or any of your readers inform me of the address of Mr. John B. Summer, who at one time was a breeder of Chesapeake Bay dogs?—M. G.

A STORY FOR THE COMPOSITORS.—The remarkable intelligence of the dog has been very many times illustrated, and in Hartford, too, but we cannot forbear to instance a still further example of what he will do when pressed by hunger. This morning the unofficial dog of the *Evening Post* office entered the composing room, wagged his tail to all the "comps" in great good humor, and after sniffing around in an innocent manner, slyly unearthed the dinner of an epicurean type-sticker and made a huge and hasty meal of it. Then he trotted off and, coiling up, went to sleep to dream of boned turkey, lollipops, cheese, crustacea, and all the other good things that make a paradise of this world in a dog's eye. The consternation and despair of the compositor, as he beheld the remains of his dinner and realized that the afternoon would have to be spent on an empty stomach, with all the ills that that implies, will remain forever fresh and horrible.—*Hartford Evening Post.*

TEST OF RABIES.—"When a person hath been bitten by a dog that is apprehended to be mad it commonly happens that the dog is killed before one is assured of his condition, and the person bitten continues in a cruel uncertainty. Mr. Petit, the surgeon, hath an expedient for putting an end to this uneasiness. He rubs the throat, the teeth, and the gums of the dead dog with a piece of meat that hath been dressed, taking care that there be no blood to stain it, and then offers it to a living dog. If he refuses it with crying and howling the dead dog was certainly mad, but if the victuals have been well received and eaten there is nothing to fear."—*Memoirs Royal Academy at Paris, 1753.*

MISTAKE IN PEDIGREE.—Rosendale, Wis., July 14.—*Editor Forest and Stream:* In regard to the article of Mr. W. N. Callender, in your issue of July 10, in reference to mistake in pedigree of Fancy, I wish to remark it is ingeniously worded, but at this time the only point at issue is, is this pointer bitch Fancy "Cara C.?" if not, then the pedigree, by whomsoever given, is fraudulent, is not "correct as to sire and dam" or "technical error," and it is for those gentlemen, without special communication with them, to explain. This bitch Fancy was advertised with a given pedigree, is it fraudulent or not?—S. B. DILLEY.

THE AMERICAN ENGLISH BEAGLE CLUB will offer one or two special prizes at the Philadelphia bench show in September. The beagle classes will be judged entirely by the standard of the club.—A. C. KRUEGER (Sec'y and Treas.).

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Picket. By Mr. D. S. Gregory, Jr., 2d, for liver and white pointer dog, whelped April 16, 1884, by Scout (A.K.R. 216) out of Ruby (Woodruff's Dick—Fan).

Sultana. By Mr. Erastus Corning, Jr., Albany, N. Y., for red Irish setter bitch, whelped April 10, 1884, by champion Glencho out of Claire (A.K.R. 233).

Lady Grace. By Mr. Erastus Corning, Jr., Albany, N. Y., for liver and white pointer bitch, whelped April 10 (Ducalion—Fancy).

Malite By Mr. J. W. Munson, St. Louis, Mo., for liver and white pointer bitch, whelped April 18, 1884, by imported Bang out of Kate (Croxteth—Trinket).

Millie. By Mr. J. W. Munson, St. Louis, Mo., for liver and white pointer bitch, whelped May 6, 1884, by champion Meteor out of Dell (Croxteth—Trinket).

Lady Alice, Maud and Blanch. By Mr. C. F. Wilson, Palmyra, O., for mastiff bitches, whelped April 19, 1884, by his Cæsar (A.K.R. 12) out of his imported Oma.

Phallas, Fantine and Monica. By the Shamrock Kennel, Beach Bluff, Mass., for red Irish setters, one dog and two bitches, whelped Sept. 6, 1883, by champion Elcho (A.K.R. 295) out of their Zelda (A.K.R. 240).

Mack Duff, Mack B. II., Peck's Bad Boy and Peck's Bad Girl. By Mr. W. B. Peck, Central Falls, R. I., for two white, black and tan and one lemon belton dogs and lemon belton bitch, whelped May 8, 1884, by Mack B. (Dick Laverack—Twilight) out of Chica (Royal Blue—Diana).

Dave Bondhue. By Messrs. Austin & Mason, Providence, R. I., for black, white and tan English setter dog, whelped Feb. 27, 1884, by Gus Bondhue (Dashing Bondhue—Novel) out of Countess Mollie (Count Noble—Spark).

BRED.

☞ *See instructions at head of this column.*

Nell Kelley—Blue Gound. Mr. W. R. Travers's (Washington, D. C.) English setter bitch Nell Kelley (A.K.R. 286) to Blue Gound (Frank—Victoria), May 14.

Fanny—Watty. Mr. G. Sanderson's (Moncton, N. B.) imported prick-eared Skye terrier bitch Fanny to his imported Watty, June 30.

Daisy Starlight—Count Paris. Mr. H. W. Durgin's (Bangor, Me.) English setter bitch Daisy Starlight to Count Paris (Royal Blue—Modjeska), May 28.

Pet Berwyn—Foreman, Mr. W. B. Peck's (Central Falls, R. I.) English setter bitch Pet Berwyn (Dashing Berwyn—May Druid) to Mr. C. Fred. Crawford's champion Foreman, June 22.

Rosa—Benefort. The Clifton Kennel's (Jersey City, N. J.) pointer bitch Rosa (A.K.R.) to Mr. C. H. Mason's Beaufort (A.K.R. 694), July 19.

WHELPS.

☞ *See instructions at head of this column.*

Nancy Rake. Mr. E. I. Milline's (Flatbush, L. I.) English setter bitch Nancy Rake (A.K.R. 42), July 13, seven (two dogs), by Mr. W. A. Coster's Buckellew (A.K.R. 30).

Bessie. Mr. A. Weeks's (Locust Valley, L. I.) English setter bitch Bessie (Gypsum—Jessie), July 12, eleven (six dogs), by Tilley's Bang Duke—Dot).

Snipe. Mr. Edward Lawrence, Jr.'s, (Boston, Mass.) red Irish setter bitch Snipe (Palmerston—Quail), July 14, nine (six dogs), by Mr. Joseph Hayes's Suil-a-Mor (Claremont—Dido).

Snowball. The Millbrook Kennel's (New York) St. Bernard bitch Snowball (A.K.R. 416), July 1, two dogs, by Prince (A.K.R. 1053); one since dead.

Flash III. Mr. J. W. Munson's (St. Louis, Mo.) imported pointer bitch Flash III. (Bang—Pride), July 13, ten (three dogs), by champion Meteor.

Queen Maud. Mr. E. S. Hawks's (Ashfield, Mass.) English setter bitch Queen Maud (Racket—Kelp), June 22, nine, by Count Oberon (Count Noble—Rosalind).

SALES.

☞ *See instructions at head of this column.*

Nancy Rake. Black, white and tan English setter bitch (A.K.R. 42), by Mr. Thos. F. Connolly, Flatbush, L. I., to Mr. E. I. Milline, same place.

Critic. Black spaniel bitch (A.K.R. 303), by Mr. Winchester Johnson, Boston, Mass., to Mr. W. O. Partridge, same place.

Prince Boy. Pointer dog, color and age not given (King Bow, A.K.R. 83—Chess, A.K.R. 77), by the Detroit Kennel Club, Detroit, Mich., to Mr. John Gross, Jr., Junction City, Kan.

Peck's Bad Girl. White, black and tan English setter bitch, whelped May 8, 1884 (Mack B.—Chica), by Mr. W. B. Peck, Central Falls, R. I., to Mr. C. Fred. Crawford, Pawtucket, R. I.

Mack Duff. White, black and tan English setter dog, whelped May 8, 1884 (Mack B.—Chica), by Mr. W. B. Peck, Central Falls, R. I., to Dr. James E. Tobey, same place.

Mack B.—Chica whelps. Lemon belton English setter dogs, whelped May 8, 1884, by Mr. W. B. Peck, Central Falls, R. I., one to Mr. Lawrence Lockwood and one to Mr. Beggi, A. Guaze, Pawtucket, R. I.

Princess Pearl. White, black and tan English setter bitch, age not given (Druid—Princess Draco), by Mr. C. R. Dufour, Washington, D. C., to Mr. W. R. Travers, same place.

Tempest—Lilly whelp. Black, white and tan English setter bitch, whelped November, 1883, by Mr. Andrew J. Ward, Boston, Mass., to Mr. W. D. Wilson, Augusta, Ga.

Peck's Bad Boy. Lemon belton English setter dog, whelped May 8, 1884 (Mack B.—Chica), by Mr. W. B. Peck, Central Falls, R. I., to Mr. E. Eastwood, same place.

Don Gus. Black, white and tan English setter dog, 3yrs. (Gladstone—Juno), by Dr. Otto Mobes, Rowland, Ala., to Mr. E. S. Hawks, Ashfield, Mass.

Foreman. White, lemon and tan imported beagle dog, 4yrs. (Bravo—Honesty), by Mr. W. H. Ashburner, Philadelphia, Pa., to Mr. E. S. Hawks, Ashfield, Mass.

Countess Lill. Black, white and tan English setter bitch, 1yr. (Gladstone—Donna J.), by Mr. J. L. Barker, Racine, Wis., to Mr. E. S. Hawks, Ashfield, Mass.

Bessie T. Black, white and tan English setter bitch, 4yrs. (Gladstone—Fly), by Mr. Geo. H. Tousey, Mandan, Dak., to Mr. E. S. Hawks, Ashfield, Mass.

Craft. Lemon and white pointer dog (A.K.R. 1038), by the Knickerbocker Kennel Club, Jersey City, N. J., to Mr. J. S. Brown, Montclair, N. J.

Chief. Black pointer dog, age not given (Stocking—Lady Mab), by the Knickerbocker Kennel Club, Jersey City, N. J., to Mr. B. P. Bell, Woodside, N. J.

Glenmark. Lemon and white pointer dog, age not given (Rush—Romp), by the Knickerbocker Kennel Club, Jersey City, N. J., to Mr. Geo. S. Tucker, Peterborough, N. H.

Jimmie. Liver pointer dog, 2yrs. (Start—Maud), by the Knickerbocker Kennel Club, Jersey City, N. J., to Mr. Louis S. Livesey, same place.

Lady Isabel. Lemon and white pointer bitch (A.K.R. 461), by Mr. Geo. S. Tucker, Peterborough, N. H., to the Knickerbocker Kennel Club, Jersey City, N. J.

Essex. St. Bernard dog (A.K.R. 931), by the Essex Kennel, Andover, Mass., to the Strawberry Hill Kennel, Leicester, Mass.

Flirt Warren. Black and white English setter dog (A.K.R. 1368), by the Strawberry Hill Kennel, Leicester, Mass., to Mr. Calvin Perry, same place.

Primer (A.K.R. 227)—Jessy Gyp (A.K.R. 107) whelps. English setters, whelped March 3, 1884, by Mr. W. E. Rea, Hackettstown, N. J., a white and lemon dog to Mr. Theo. A. Weller, Middletown, N. J., and a white and black bitch to Mr. W. H. Larison, Madison, N. J.

A SURPLUS OF NEARLY $2,000,000 is the solid guaranty offered by the Travelers, of Hartford, Conn., that all just claims will be paid in full, as they always have been.—*Adv.*

Rifle and Trap Shooting.

RANGE AND GALLERY.

THOMASTON, Conn., July 8.—The Canton Rod and Gun Club and the Empire Rifle Club shot the second of the series to-day on the range of the latter club, near Reynold's Bridge, in which the Empires were victorious by 30 points in a possible 1,500. Part of the match was shot in the rain, which made a rather bad light. The conditions were teams of nine men each, 10 shots per man off-hand, distance 200yds., Massachusetts ring target. Following are the scores:

Canton Team.										
Q B Hull	11	10	11	10	11	11	12	7	12	9—104
S J Lyons	9	11	11	9	10	11	9	10	11	12—103
G J Case	10	12	12	6	9	10	9	10	10	11— 99

J D Andrews	8	10	12	8	7	10	10	10	10	9— 93
J Laubenstein	7	11	8	8	11	10	9	9	7	10— 90
B O Higby	11	6	12	7	8	10	9	9	7	9— 90
G F Lewis	4	9	6	8	8	4	4	6	11	11— 71
J B Flint	7	10	2	8	5	8	9	8	6	6— 69—816
Empire Team.										
W H Dunbar	9	10	9	11	11	10	10	8	11	11—100
G Gilbert	7	10	9	11	8	12	10	10	9	12— 98
G C Canfield	12	10	10	5	12	10	10	10	12	7— 98
G A Lemmon	10	9	10	9	10	11	11	7	11	8— 96
C F Williams	7	11	10	10	9	8	9	10	10	11— 95
E Thomas	7	10	10	7	11	10	11	10	8	9— 93
F Carr	11	10	8	9	9	11	9	7	7	7— 90
A S Hubbard	6	10	7	11	10	9	7	11	8	10— 89
E W Bennett	11	9	11	5	10	4	7	10	12	8— 87—846

At the weekly shoot for the badge, July 12, the following scores were made: F. Carr 102, C. F. Williams 98, C. L. Alling 96, G. A. Lemmon 93, G. P. North 88, A. Fox 84.

GARDNER, Mass., July 17.—Yesterday was the regular day for the meet of the Gardner Rifle Club at Hackmatack Range. The American decimal target was used; distance, 200yds.; shooting off-hand, with a possible 100. Only a few members faced the bullseye, their scores being as follows: J. N. Dodge 86, G. F. Ellsworth 84, A. Mathews 81, W. C. Loveland 77.

JAMESTOWN, N. Y., July 18.—Regular medal match; Creedmoor target; 200yds. off-hand; 10 rounds, wind at 9 o'clock light, bright light: S. N. Ayres 45, H. V. Perry 45, N. J. Fenner 44, R. H. Burns 44, A. F. Ward, 43, F. K. Dowler, 41, A. F. Warner 41.—R. H. BURNS.

THOMASTON, Conn., July 19.—The weather conditions at our weekly shoot to-day were very unfavorable for high scores. Part of the match was shot during a thunder shower, with a strong wind blowing directly across the range. Following are the scores:

G Gilbert	10	7	7	9	9	12	9	12	12	11—98
G A Lemmon	9	10	8	9	10	7	11	9	10	11—94
C L Alling	12	9	5	10	10	9	7	11	9	10—92
W Kerwood	12	11	7	11	4	9	5	9	10	11—89
C F Williams	9	7	8	10	8	9	9	9	9	10—88
A Fox	10	7	10	10	6	10	11	6	8	8—86
F A Perkins	10	9	8	7	8	6	10	9	8	11—86
B W Pease	9	2	9	11	10	5	7	11	11	10—85

BOSTON, July 19.—There was a large attendance at Walnut Hill to-day, and while the gentlemen found a very perplexing wind from 6 o'clock, still it was a delightful place to spend a summer afternoon. No very high scores were made, and not many were finished, the gentlemen preferring to experiment rather than to struggle for high record. A team match was shot between two teams of the association, which resulted in a victory for Mr. Berry's team. Following are the best scores:

Creedmoor Practice Match.

H Cushing	5554445545—46	R Borden	4448444454—40
E C Barnes	4444555544—44	H M Cross	4345332444—36

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

CLAY-PIGEON POINTS.

Editor Forest and Stream:

Will you kindly allow us to answer a few criticisms lately passed on us? With reference to inaccuracies in the count of the number of clay-pigeons in a barrel. Any such mistake (for such they are) made by any of our packers will always be cheerfully remedied by us upon authoritative representation through the trader of whom the club purchased same. No honorable sportsman and no sensible man can believe for a moment that such a miscount has been made intentionally. We have three packers at work, the public are welcomed to inspect our packing department at any time. The clay-pigeons are first "strawed" in groups of five high, which groups are then placed in a crate beside the packer, who then counts the number of groups of five high he places in the barrel, a few odd ones being used now and then to fill the interstices. We are doing and have been doing all we could to avoid miscounts, which, if they occur now, are due to fallibility of man, and which we always "make good." It has been suggested that we pack the clay-pigeons in boxes holding 100 each. This we are prepared to do at the extra charge of fifteen cents per box. Should any club prefer same let them give their orders for same through their nearest traders and we will ship same at twenty-four hours' notice.

Secondly—With reference to the "aggravating tail." We thought we had overcome this difficulty, judging by the numerous conversations with sportsmen at the Chicago clay-pigeon tournament. However, by Aug. 1 we will be prepared to supply clubs, etc., with a de

tachable "spring" metal tongue, to be used when the pasteboard tongue is torn off by the carelessness of the trapper or becomes useless through moisture. This substitute will not prove equal to the pasteboard, which we predict will always make our present clay-pigeon the best substitute for the live bird which will ever be placed upon the market.

Thirdly—With reference to the legality of our patents. We must decline to discuss our legal attitude in a sportsman's paper, but will do so in the U. S. courts of justice whenever the occasion offers. We have repeatedly offered (and hereby repeat the offer) to any would-be competing manufacturer—both through the press and to individuals—to enter a full, personal, legal discussion, and to expose our evidence, to show our books as to cost of manufacture. Any one who will do so will undoubtedly withdraw from his contemplated opposition enterprise.

Fourthly—As to the cost of the clay-pigeon; irrespective of "patent" or "no patent," we desire to say (though we presume many of your readers will not believe this) that our profits are less than the same capital would earn if invested in any stable manufacturing business not protected by patents. As partial proof (and we trust all candid sportsmen will listen to us on this point) we will mention the following: (a) In Holland (where there is no patent law whatsoever) some manufacturer tried to make the clay-pigeon and failed utterly. (b) An English company, after canvassing the whole of Great Britain, found one firm who undertook to make the clay-pigeon at £3 (about $15) per 1,000, upon a contract to manufacture 150,000; result, a failure, though the retail price in England is $30 per 1,000. (c) A firm in France made a similar failure. (d) A firm in Toronto, Canada, tried a similar experiment; result, a failure, though the duty there is 25 per cent. on the invoice price of the import. We claim broadly that no better in this country can manufacture same in quantity at less than $15 to $18 per 1,000; if any man thinks otherwise, a walk through our factory will convince him to the contrary. Therefore, we trust that sportsmen will cease to backbite us on account of the price. Those who do not wish to use them, need not do so; all we ask is that they cease to compare the price with that of the insipid glass ball, but rather with that of the game, gallant bird it strives to emulate, and with the success now universally recognized.

Fifthly—With reference to reloading the trap after each shot. When shooting at five traps we are decidedly in favor of same in order to assimilate live bird shooting in the field. Trap-shooting, to preserve its charm, and above all to raise this sport from the level of the pure gamester to that of the gentlemanly sportsman, must be made as nearly analagous as possible to field shooting, preserving all the uncertainties of the latter. The man who shoots for money only wants no uncertainties whatsoever; he who shoots for pure love of the sport (even though some "sugar" be mixed in the "tea") prefers the uncertainties of field shooting, and desires to see those uncertainties incorporated in any artificial trap-shooting. Now this is a point on which honest sportsmen may differ, and I doubt not the sentiment is equally divided on this subject; therefore, Mr. Editor, let us have a full discussion from all sides. Our desire is to see trap-shooting contests placed on a high level, so that the thousands of amateur gentlemanly sportsmen, who to-day hold themselves aloof from tournaments may be induced to participate. We would like to see trap-shooting contests on a large scale and of frequent occurrence in all our principal cities. There are thousands of people to-day who attend baseball contests, who never handle a bat; and we wish to see these same people witness gun club contests, though they never handle a gun. Rob trap-shooting of its uncertainties and this can never be accomplished; give it all the uncertainties practicable and success will surely follow. Do not the baseball patcher and batter vary their balls? In billiards do not contestants have uncertain conditions? How stupid a championship game of billiards would be, if each player had the same certain shot instead of the present varied uncertainties. Let trap-shooters do likewise, if they would triple and quadruple the number of contestants at their tournaments, whether local or national.

We trust no man will take offense at the above criticism; we wish to antagonize no man, we care not what the motive may be which prompt a man to enter a shooting contest. What we wish to do is to increase the present passive interest of the public in shooting matters to the mutual interest and pleasure of the present shooting. Let us ask ourselves why shooting has heretofore failed to draw an audience? Is not the gun much more attractive than the bat? Is it not a more manly sport? To all answer in the affirmative. Wherein then, lie the faults of the past, and what should be done to place shooting on so broad a basis that a man need not blush to be known as a "sportsman" or to participate in a trap-shooting contest under his proper name, in place of a *nom de plume*? Doubtless this latter remark will astonish some of your readers, but it conveys the truth as we have ascertained through contact with devotees of the gun throughout the country. Our remedy is conveyed in the above suggestion, viz.: to assimilate "trap-shooting" to "field-shooting" so as to preserve all the uncertain conditions possible; it will place the amateur on a par with the professional, it will increase the interest in all shooting contests, it will draw the public, it will greatly increase the ranks of the shooting fraternity.

J. E. BLOOM (for L. C. P. Co.).

CINCINNATI, July 11, 1884.

DETROIT, Mich.—Maine Gun Club.—The following scores were made at the last match of the club:

THE MISSOURI STATE SPORTSMEN'S ASSOCIATION will probably not have a meeting this year, as there are no wild pigeons to be had.

ALBERT LEA, Minn., July 17.—Combination traps, 18yds. rise, first notch:

J A Fuller	0100101001101101001100000100101111010101010100111—24
B Pinkham	1001101011101100010110000111001110011010000101011—26

WINCHENDON, Mass., July 17.—The Winchendon Gun Club had their regular shoot yesterday. Out of a possible 10 clay-pigeons, the result was as follows:

G S Loud	0100111111—7	P S Davis	1001000110—4
L F Martin	1010101110—6	Dr J G Henry	1000010010—3

Moses Manzer	0010101101—5	F M Brown	0000000110—2

THE NEW YORK TOURNAMENT.—In our last issue was given the programme of a three days' tournament, which will be held at the Metropolitan Base Ball Park, in this city, Aug. 14-16. That the meeting will be an interesting one is already assured by the entries which have been made. They comprise the Exeter (N. H.), Massachusetts Rifle Association, Boston, Worcester, Windsor (Conn.), Jersey City Heights and Capital City (Washington) clubs, and about as many more are expected.

TRAP-SHOOTING GROUNDS IN NEW YORK.—One great drawback to the sport of trap-shooting in New York has been the necessity of crossing the ferries to find suitable grounds. There are many suitable grounds in the upper part of the city, but shooting there is prohibited by a city ordinance. Through the exertions of Mr. J. E. Bloom, of Cincinnati, the New York Aldermen last week adopted a resolution permitting the use of shotguns in the Metropolitan Base Ball Park, at the corner of First avenue and 107th street, reached via the Third avenue Elevated to 106th street. We presume that the grounds could be secured by gun clubs on very reasonable terms.

TOPSHAM, Me., July 18.—Regular shoot of Riverside club for club badge, 20 clay-pigeons, 10 singles, 5 pairs, 3 traps, use of both barrels:

Goud	1011111111	10 11 11 11 01—14

ASSOCIATION OF THE CAROLINAS.—Rockingham, N. C., July 16.—*Editor Forest and Stream:* The tournament (?) of the Sportsmen's Association of the Carolinas, will not take place in Columbia, S. C., on the 23th inst., as I advised your readers. It has been postponed so as to get a day which will suit better the convenience of one of our members. I will endeavor to inform all persons interested, in due time for them to make all arrangements, and have requested T. H. Gibbes, Esq. to make all needful communications in the matter. At present I am inclined to think the shooting will take place in Charlotte, N. C., during the latter part of August.—WELLS, President.

LOWELL.—The Lowell (Mass.) Rod and Gun Club's second annual tournament will be held at the club grounds, July 30, clay-pigeons and glass balls, open to all. For programme address the secretary, E. W. Lovejoy.

Yachting.

DORCHESTER Y. C.

THE eighty-first matches of the Dorchester Y. C. were sailed in Dorchester Bay on July 15, in a strong breeze from northwest. The course for first class, 21 and under 27ft., was from a line between the judges' boat and stakeboat to Cow Pasture buoy No. 6, leaving it to port, to buoy No. 7 off Fort Independence, leaving it to starboard, Spectacle Island, Sculpin Ledge buoy and buoy No. 6, Lower Middle, on port, Cow Pasture buoy No. 6 on starboard, to finish—9½ miles. The second class, 18 and under 21ft., and third class, under 18ft., started from the same line, leaving Farm Bar buoy on port, Old Harbor buoy, Half Tide Rock buoy, Farm Bar buoy for the second time, Old Harbor buoy, Half Tide Rock buoy on starboard, and finally Farm Bar buoy on port, a total distance of 7½ miles. The sloop yacht Lydia Adams was used as a judges' boat. Seventeen yachts started, all being double reefed, and fourteen went over the course, as follows:

FIRST CLASS.	Length.	Actual.	Corrected
Sea Bird, G. L. Forbush	24.02	1 50 57	1 18 39
Amy, E. W. Baxter	21.00	1 57 13	1 22 03
Thisbie, S. A. Freeman	21.02	1 58 16	1 23 21
Saracen, W. P. Fowle	22.10½	2 06 02	1 34 32
SECOND CLASS.			
Scamp, F. Gray	18.04½	1 31 00	1 00 17
Niobe, F. L. Dunne	20.01	1 30 29	1 01 46
Water Witch, T. W. King	19.05	1 30 49	1 02 21
Madelon, W. A. Tucker	20.07	1 32 25	1 04 15
THIRD CLASS.			
Mirage, A. J. & L. M. Clark	17 05½	1 34 56	1 03 03
Nonpareil, E. Lanning	16.06	1 36 06	1 03 15
Guenu, W. L. Dearborn	17.07½	1 39 37	1 07 58
Juliet, H. L. Mann	17.10	1 47 18	1 15 55
Yolande, C. H. Nute	16.00	1 50 11	1 16 22
Ethel, W. F. Cutter	16.08	1 53 44	1 20 46

The judges were C. M. Noyes, C. H. Whiting and A. J. Clark.

YACHTING IN SAN FRANCISCO.

THE run of the Pacific Y. C. from San Francisco to Santa Cruz, on July 2, proved by far the most interesting race yet sailed by the club.

The start was made early in the morning, the yachts towing out from their rendezvous off Front street to the Heads.

The competing yachts were, Halcyon, 72ft. waterline; Casco, 85ft.; Lurline, 72ft.; all keels, Aggie, 70ft.; Annie, 45ft. 6in.; Ariel, 69ft.; Nellie, 43ft. 6in.; Fleur-de-Lis, 59ft. 10in., centerboard, and Lady Mine, a keel pilot boat. Halcyon was first away at 8:48 A. M., standing off shore to windward, with kites set. Lurline over within a minute of her, but keeping in shore. Aggie starting with the pack, soon lett them and overhauled the two leaders near Point Pedro about 10 o'clock, Lurline dropping astern shortly after, the wind being very light.

The after division were having a race to themselves meanwhile, Nellie taking the lead finally and holding it, with Annie last. The last twenty miles was in a fine breeze, in which Nellie gained on the Aggie but could not pass her, the latter crossing the line one minute ahead. The full times were as follows:

	Start.	Finish.	Elapsed.	Corrected.
Halcyon, k	8 48 00	4 34 00	4 46 00	7 27 37
Lurline, k	8 48 35	4 26 45	7 38 10	7 19 37
Aggie, c. b	9 01 22	4 25 40	7 24 18	7 01 16
Lady Mine, k	9 36 40	5 27 20	7 50 40	7 50 40
Nellie, c. b	9 38 39	5 34 30	7 56 10	7 11 45
Casco, k	9 38 50	5 34 00	7 55 10	7 53 10
Fleur de Lis, c. b	9 39 50	5 40 55	8 01 25	7 23 09
Annie, c. b	9 40 40	6 38 30	8 37 05	7 55 17
Ariel, c. b	9 41 20	7 00 00	9 18 40	8 53 45

The four prizes are of silver, their total value being $500.

The San Francisco Y. C. contented themselves with a quieter cruise than that of their more daring rival, braving the dangers of the Napa River in preference to the Pacific swells.

The fleet sailed on Thursday evening from San Francisco, Sea Nymph going in advance, the others—Startled Fawn, Whitewing, Chispa, Rambler, Lolita, Emerald, Frolic, Dawn, Ripple, Nellie, Magic, Spray, Idle Hour, Neva, Eva and Thetis—arriving at Vallejo by moonlight.

Some smallboat races were promised on the morning of the 4th, but none took place. At 9 A. M. all sailed for Napa, the only incidents of note being the grounding of several yachts, which occurred sufficiently often to justify the suspicion that more than one San Francisco yachtsman used his chart of the Napa upside down. Lolita was first in, then Emerald, Rambler and Fawn.

After some boat races, the party gathered on board the Whitewing and Chispa, where several hours were passed pleasantly, the fleet starting down in the evening in tow of two steam launches. Chispa grounding and lying ashore all night. The others left Vallejo at noon on the 6th, arriving in the evening at their moorings.

AMERICAN Y. C., STEAM YACHT RACES.

THE following circular and the report appended have been issued by Mr. Henry A. Taylor, secretary of the American Y. C., concerning the coming races of the club from Larchmont to New London in August. The club have accepted the invitation of the Larchmont Y. C. to rendezvous at Larchmont for the start:

There will be a rendezvous of the yachts of this club, prior to a regatta and cruise, at the Larchmont club house, on Wednesday, 6th of August next, P. M. From thence, at 10 A. M. on the following day, there will be a race around the lighthouse off Stratford to abreast the lighthouse at New London, and prizes of equal value are to be competed for in two classes of yachts, viz.: first class, all exceeding 100 gross tons; second class, all under 100; two or more entries in a class necessary to make a race.

The restriction of yachts to but two classes is for this occasion only, and is the consequence of there being but two prizes for competition with allowance of time. A third prize will be awarded to the yacht making the least time over the course without reference to allowance of time.

Owners of steam yachts of any organized club are invited to enter and to compete for the prizes under time allowance. The allowance of time is that recommended and reported by a select committee, and which has been adopted by the club, a copy of whose report is herewith inclosed.

Owners of yachts desiring to enter for competition in the above race, or in any that may occur during the cruise, are required to furnish the Measurer (Chas. H. Haswell, Box 2,961, N. Y.), on or before Monday, the 4th August next, at 2 P. M., at which time the entries will close, with the name, tonnages as taken from their register issued during the current twelve months, area of grates and character of combustion, as whether natural draft, jet, blast or exhaust, also with a copy of their signal, provided it is not already furnished.

The Regatta Committee will make the necessary arrangements, compute the time allowance, and have direction of the race, or any that may occur during the cruise, and all questions arising between competitors will be decided by them, under the rules and regulations of the club, so far as they may apply, and the decision of the committee will be final.

Report of the Committee on Time Allowance:

The committee to whom was confided the preparation of a rule for the determination and governing of time allowance of steam yachts in a competitive operation, respectfully submit that, having considered the subject and communicated with several engineers and owners of yachts in relation thereto, they find, that in order to attain a condition of competition approaching to that of exactness, that it would be necessary to ascertain the displacement of the vessel, the area of her freeboard at different drafts of water, the weight of the fuel carried, the character of its combustion, a reliable report of its consumption, and a visual verification of the pressure of steam, point of cutting off, number of revolutions, etc. The first two of which elements would involve the mitiatory computations of an expert, and the least of the latter, the presence of a capable and disinterested party to verify, whenever the vessel was in operation. Added to which, the attainment of the initiatory elements of displacement and areas would involve a character of labor and amount of expense wholly impracticable for the club to provide for at this time.

In view then of the assent that has been given to the report of Mr. Haswell on this subject to Secretary Taylor, in June last, we have decided to adopt the method therein detailed, with the units for allowance for the different characters of combustion of the fuel, viz.:

$$\sqrt[3]{\frac{GC}{T^2_3}}\ V.,\ \text{or, in other words,}$$

The velocity of a vessel is assumed as the cube root of the quotient of the product of the area of her grate surface, and constant due to the character of combustion, divided by the cube root of the square of her gross tonnage.

The constants being for natural draft, 1; jet, 1.25; blast and exhaust, 1.6, and in order to further equalize competition we recommend that the yachts be divided into three classes, thus: 1st class, 250 gross tons and exceeding that. 2d class, 100 gross tons and less than 250. 3d class, all under 100 tons.

Respectfully yours,
J. C. HOAGLAND.
GEO. W. HALL.
CHAS. H. HASWELL.

HENRY A. TAYLOR, Secretary American Y. C.

BEVERLY Y. C. SECOND CHAMPIONSHIP RACE.

THE second race for the Buzzard's Bay championship was sailed on Saturday last, the day opening with a S.W. by S. wind, so strong that the second class cats did not start. In the large cat class Iris was disabled and could not start, and no club member could be found to sail Lestris and Violet.

The preparatory gun was fired promptly, and at 1:12 the boats went off to a one-gun start, Tantrum and Whisper coming almost on the second, with Flirt, Atalanta and Mascot just astern, and Mattie, who was caught napping, just two minutes later.

Mascot crossed just to windward of the stakeboat, and would have been ruled out if she had come in first. Atalanta and Whisper carried single reefs, the other boats double reefs.

They had it hot and heavy beating out to Scraggy Neck, then a run across to Bird Island, and home with the wind on the quarter. Coming in Tantrum and Flirt shook out their reefs and crossed the line side by side.

	Length.	Actual.	Corrected.
Atalanta, I. R. Thomas	29 07½	2 02 17	1 54 02
Whisper, F. W. Sargent	28.00	2 05 15	1 55 30
Mattie, Vice-Com. Stockton	28.10	2 05 46	1 56 47
Tantrum, J. M. Codman	25.00	2 13 32	2 00 27
Flirt, Geo. H. Lyman, Jr.	25.02	2 13 32½	2 00 45½
Mascot, F. E. Bacon, Jr.	24.06	withdrew.	

Judges: Edward Bangs, E. A. Bangs, W. Lloyd Jeffries. Judges' yacht, Madcap, B. Y. C.

BLUE WITH A GOLD CASTLE.

STEAM YACHTS AND STEERING GEARS.

A NEW device for quickly Landling a steam vessel has been applied to the steam yacht Vixen, built by Mr. John Samuel White, of East Cowes, for Lieut.-Gen. Baring, and described in the London *Field* of June 28.

Two balanced rudders are employed, the larger, of 8sq. ft. area, being fitted abaft the wheel in the usual manner, but the smaller, of 4sq. ft., is hung directly forward of the sternpost, the deadwood being nearly all cut away, the rudder filling the space between the keel, sternpost and shaft. The rudder heads, above deck, are connected by chain gearing, one wheel, of course, operating both. In a trial of her speed in turning, on the helm being put hard over, an angle of 45°, the time occupied being 7 seconds, the boat turned in a circle of two and one-quarter times her length, or 137ft., in 38 seconds. The dimensions of the yacht are: Length over all, 62ft.; length on water-line, 61ft.; extreme beam, 11ft.; depth, 5ft. 1in.; extreme draft, 4ft. 10in.; displacement, 18 tons; cylinders, 8½ and 13in. by 9in. stroke; screw, 4 blades, 3ft. 8in. in diameter, 4ft. 1½in. pitch.

Mr. Stewart Clark, owner of the Vanduara, has lately had built for him a new steam launch named Morna, from designs by Watson. She is intended for a tender to the Vanduara, and is spoken of as a very handsome vessel.

The Kunstadter screw has lately been tested in this country by the Naval Board, who will report in its favor. The trials were made at Newport, ending on July 9. In the first trial the boat was reversed from full speed ahead to full speed astern in 2m. 43s., the helm being hard over, changing the head eight points, the same maneuver without the extra screw occupying six minutes like good staunch ships should do. Though the Sunbeam came out ahead, it was clearly demonstrated that the narrower boat, with greater freeboard, was all the time the ablest and safest boat. Captain Krouse made a mistake in his course, and that beat him. Wide boats, however well shaped, cannot cope with narrower ones in a sea.

Your readers will remember in the report of the annual regatta, June 2, Quaker City Y. C., the Thomas won the first prize and the Commodore's challenge cup. The Nahma, winning second prize, challenged the Thomas for the cup, according to the rules of the gift. The boats sailed on July 14, over the Q. C. Y. C. course, starting at 10:05 A. M., wind blowing hard from N.W., going with nearly a square boom. The Thomas with a single reef in the mainsail, whole jib, the Nahma with a double reef hauled down. The boats ran side by side until reaching the Horseshoe, where the river turns to the westward, bringing the boats sharp on the wind. The Thomas outlooked and outfooted her opponent, and kept opening the gap to the buoy on the upper spit of Chester Island, turning it 11:55, Nahma 12:01. Squaring away for home, Thomas shook out reef and set jibtopsail, Nahma coming along with her two lower sails only, gradually but surely closing the gap. Passing inside of Ironside shoal, she came up abreast and the Thomas set working topsail, but without avail, and rounding the Shoe, the Nahma went to the front in good style, her powerful wide headsail making her jump. For myself I can say, as an old yachtsman generally steady under excitement, I caught the "thrill," and was just as crazy as any one else. It was now anybody's race. The yachts winded each other alternately. It was nearly a dead beat from the Shoe to the home stakeboat, which was reached: Thomas, 2:10 P. M.; Nahma, 2:10:08. I desire to return thanks to the Thomas's crew, one and all, for their courtesy to me as the Nahma's judge.

R. G. WILKINS.

CAPSIZE OF A SANDBAGGER.—A race between open boats took place on July 19 in Newark Bay, the course being 10 miles. There were eight entries, and the wind was squally. Just Woke Up capsized near the Newark Bay Bridge, her crew of sixteen men being thrown into the water. The leading boat, Maggie P., went to their rescue, taking four on board, the Emma C. also rendering necessary assistance. Maggie P. went on finally winning on time, Emma losing her chances by staying to help her unfortunate competitor. The times were as follows:

FIRST CLASS—JIB AND MAINSAIL.	Start.	Finish.	Elapsed.	Corrected.
Just Right	3 45 30	5 29 45	1 44 15	1 44 15
Emma C.	3 45 15	Did not go course.		
Just Woke Up	3 45 45	Capsized.		
Maggie P.	3 45 00	5 28 00	1 43 00	1 42 00
SECOND CLASS—CAT RIGGED.				
Triton	3 40 45	5 17 00	1 36 15	1 36 05
Whisk	3 41 30	Did not go course		
Zephyr	3 40 00	5 27 00	1 47 00	1 47 00
Bon Ton	3 40 15	5 20 00	1 39 45	1 38 55

EAST BOSTON YACHTING.—The Jeffries Boat Club, of East Boston, held their races on Saturday last. The boats were divided into two classes, the prizes for the first being $20 and $10, and for the second $15 and $5. The course was 12 miles for first class and 6 for second, with a strong northwest wind blowing, the start being made at 3:32, but two boats entering.

	Length.	Actual.	Corrected.
Una, John Marno	29.00	1 50 15	1 45 50
Judith, E. T. Pigeon	26.10½	1 59 16	1 59 16

The second class got away at 3:31, finishing as follows:

	Actual.	Corrected.
Hard Times, Geyer & Moore	1 6 40	1 6 40
Zetta, Warren & Fowle	1 6 44	1 6 32
Unknown, Ambrose Martin	1 8 16	1 8 03

Mr. B. S. Palmer was time keeper and judge. The next race will occur Saturday afternoon next, at 3 o'clock.

DORCHESTER Y. C.—The next meeting of this club will be held on July 28, and will be open to boats of the club of 18 and under 21ft., the courses being 7½ miles. The prizes offered are: For first class, $12 and $6; second class, $10 and $5. The first signal will be given at 2:55 P. M., the starting signal at 3 P. M. for first and 3:05 for second class. One man is allowed for every five feet of deck length, and no shifting ballast is permitted.

AN ADVENTUROUS VOYAGER.—Captain W. Johnson, a Norwegian, arrived at the Town Quay, Southamption, on Saturday, in his little craft Neptune, a boat somewhat of the whale-boat type, rigged with two masts, carrying a jib, lugsail, and mizzen. Captain Johnson early in last year sailed this boat from Drontheim, in Norway, to London Bridge, his narrative of the voyage afterward attracting much attention. The Neptune was shown in the lake at the Horticultural Gardens, South Kensington, during the time the International Fisheries Exhibition was on view, being in company with many other curious craft. She is 26ft. long over all, with a beam of 5ft. 2in., and is decked in with waterproof weather cloth to cover up the well. Captain Johnson sailed from the Thames on April 1, his only companion being a cat, and he has been cruising along the north coast of France, and, crossing to Worthing, had his little boat hauled up on the beach, where she was an object of much curiosity, a photograph being taken of her and her owner. The Neptune is now hauled up in Stockham and Pickett's yard at West Quay, and is having an iron keel put on. Captain Johnson intends to cross the Atlantic in her if possible, and will commence his voyage at the Town Quay some time during to-day.—*Land and Water, July* 12.

EASTERN Y. C.—The prize which was won by Fortuna at the annual regatta on the 27th of June last, has been returned as a cup, by Commodore Hovey, to the regatta committee, who have decided to offer it to be sailed for on the annual cruise of the club, at New Bedford, on Monday, the 28th July (or, if stormy, next day), open to first and second class schooners of any club, E. Y. C. measurement and allowances. The course will be notified to the boats hereafter. The race will be sailed in cruising trim, with anchors and chains on board, boats at davits, etc., but sails allowed by E. Y. C. rules may be carried. There will also be sailed at the same time and place, a race for first and second class sloops, for a cup offered by Commodore Hovey, over the same course, and under the same conditions. These races will be started as near to twelve o'clock as possible, and the committee's boat may be used as a stakeboat at the beginning and finish. Entries may be made to the fleet captain, at the flagship Fortuna, up to eleven o'clock on the day of the race.—Daniel Appleton, George A. Goddard, Edward B. Haven, Regatta Committee. (Boston, July 18, 1884).

TORONTO Y. C.—A race for yachts of 7 tons and under was sailed on Saturday, July 19, with three entries, Iris, Mischief and Kestrel. The start was made at 3 P. M. from the club house, in a northwest blow that put all under close reefed mainsails and storm jibs. Mischief crossed first, with a good lead over Iris, Kestrel being delayed considerably. The time at the first buoy was: Iris 3:16, Mischief 3:18:30, Kestrel 3:27:20, Iris having more than made up her loss. In the run to the buoy off Gibraltar Point, Iris still held her place, rounding at 3:39:45, Mischief at 3:31:15, Kestrel 3:40. Here Kestrel had a misunderstanding with her spinnaker boom, which went overboard, one of her crew going over as well, but both being picked up. So much time was lost, however, that she withdrew. Iris rounded the next buoy at 4:08:15, and Mischief at 4:12:45, and started for a run down, Iris with gafftopsail over close-reefed mainsail. Mischief could not carry her spinnaker, though she tried. Iris finished at 41:44, beating Mischief 5min. on corrected time. Iris has to win once more before owning the prize.

HULL Y. C. OREGON HOUSE MATCHES.—A match will be sailed on Saturday, July 26, off the Hull Y. C. house, open to all yachts of the club, for prizes given by the guests of the Oregon House, near by. There will be four classes of yachts, as follows: First class, keel sloops, measuring 21ft. and under 28ft.; second class, centerboard yachts, measuring 20ft. and under 25ft.; third class, cat rigs, measuring 18ft. and under 20ft.; fourth class, cat rigs, measuring under 18ft. The prizes are: First class, first prize $25, second $10; second class, first prize $25, second $10; third class, first prize $20, second $10, third $5; fourth class, first prize $15, second $10, third $5. The courses will be 10 miles for first and second classes, and 6 miles for the third and fourth. The first signal will be given at 3.30 P. M., the starting signal at 3:40 for first class, the others starting at 3:45, :50 and 3:55 respectively. The committee are Messrs. Harrington, Dunne and Brown; judges, Messrs. L. J. and C. F. Harrington, and M. J. Kiley.

OPEN BOAT SAILING IN NEW YORK.—Our columns every week ear testimony to the popularity of smallboat sailing in Boston, nd this week the Beverly, Lynn, Dorchester, Hull and Salem clubs are on record with matches just sailed or about to be. In New York the record is easily summed up; a race on Newark Bay on the 19th, in which the capsize of one boat in a strong tideway placed the lives of her crew, sixteen men, in great danger for a time; another race on the following day in the Sound, with another capsize, the five men being finally rescued, and an upset of a small, shoal sailboat, with a party of six, half of them women, in the Hudson. These last also were saved, but only by chance. How much longer are we to wait, and what emphatic warning to come, before the advent of safe boats, limited crews, and fixed ballast?

HULL Y. C., LADIES' DAY.—Thirteen yachts took part in the ladies' day sail of the Hull Y. C. on July 19; the schooners Silvie, Com. Perkins; Vif, Vice-Com. Crane; yawl White Cap, Rear-Com. Rice; schooners Geo. H. Warren, Alice, Marion Wentworth and Tempest; sloops Anna, King Philip, Ella May, Ariel, Vishnu, and cat Rambler. With a fresh wind from southwest the fleet started off under single and, in some cases, double reefs, the signal being given at 2:45 P. M. The fleet sailed past the Silvis in review, then stood out through Hull Gut, down almost as far as Minot's light, then turning sailed in, arriving at about 6 P. M. The ladies were taken ashore in the tug Wesley A. Gove to the club house, where supper was served, after which a dance occupied the rest of the evening.

BEVERLY Y. C. BOOK.—The Club Book for 1884 shows a membership of 127 with 88 yachts, all being under 30ft., among which are 8 cutters, 2 yawls, 19 sloops, 1 schooner and 59 catboats, 23 keel and 65 centerboards. The success this club of small boats has met with may be judged from the list of its matches last year, a full account of which is given. The entries for the eleven matches sailed during the season, were no less than 303, nearly all the boats starting. The grand occasion of the year was the open race in August, in which 190 yachts entered, by far the largest fleet ever brought together in a race in American waters, while the arrangements were so perfect that the large fleet were started and timed with hardly any mishaps.

NEW HAVEN Y. C. CRUISE.—A start was made on Saturday, July 19, delay being occasioned at first by a violent thunder storm at the hour appointed. The fleet includes the Minerva, Mascotte, Zephyr, Acme, Wild Pigeon, Vixen, Endeavor, Rajah, Flora, Marguerite, Ceres, and Wild Duck. On Monday at 7 A. M. the yachts left Stony Creek, arriving at Greenport in the afternoon. Endeavor and Mascotte put back owing to the heavy weather on the Sound. On the run across Rajah arrived first at Greenport, having been lost under way at Stony Creek. The fleet will proceed to New London, Newport, and New Bedford, where a race will be held. The start for home will be made on the 28th.

LAKE YACHT RACING ASSOCIATION.—The new Lake Yacht Racing Association will hold their first matches at Oswego on July 30, and a large number of boats will probably enter. The following prizes are offered: First class, first $150, second $75, third $50; second class, first $100, second $65, third $35—a third prize only being given if four boats start and a second if three start. The second race for the championship pennant given by Commodore Mott will be sailed by all yachts of the Oswego Y. C. over the second class course. All races will be sailed under the rules of the L. Y. R. A. Entries must be made in writing to W. E. Lee, secretary, on or before July 28.

A NARROW ESCAPE.—A party of six, three of whom were ladies, were thrown into the Hudson on Sunday by the capsize of the catboat Edith, a trap of the usual model. In this case the presence near by of the police boat, Patrol, prevented the customary tragedy attendant on such accidents. If men choose to peril their own lives in such machines perhaps they have a right to do so, but risking the lives of women who are ignorant of the danger and trust in their superior knowledge is a different matter.

A NEW YORK BOAT IN EASTERN WATERS.—The owner of the open jib and mainsail boat Cruiser, well-known in the Seawanhaka and Larchmont clubs, will take his boat to Boston next month, for a series of races with Eastern boats. The following races have already been arranged: Aug. 18, A. M., Thisbe; Aug. 18, P. M., Viva; Aug. 19, A. M., Hornet; Aug. 19, P. M., Holden; Aug. 20, Amy; Aug. 21, Queen Mab; Aug. 22, Sea Bird; Aug. 23, Black Cloud. The Cruiser will also enter the matches of the Hull Y. C. on Aug. 16 and Beverly, Aug. 23.

BEVERLY Y. C.—The second championship matches will be sailed on July 26, at Swampscott, at 12 M. The classes are: First, over 23ft. 6in. and under 30ft., water-line; second, over 19ft. 6in. and not over 21ft; third, 19ft. 6in. and under. No change of ballast may be made on the day of the race. The time of the race is limited to 2½ miles per hour for second and third classes, 2¾ miles for all others. A special prize for first class schooners, and also one for second class keels, will be given, provided two start in a class.

OPEN BOAT RACE ON THE SOUND.—A race was sailed on Wednesday, July 16, from Bridgeport Light to Westport and return, 20 miles, between the open yachts Americus, Hugh Masterson, and Alice, E. W. Smith, both of Bridgeport. The Americus won in 4.37, beating the Alice 24 minutes, corrected time. The race was sailed under the rules of the Dorchester Y. C.

LYNN Y. C.—The Lynn Y. C. will hold their matches on Saturday next, off their club house, starting at 1 P. M. There will be three classes.

WRECK OF A YACHT ON LAKE ERIE.—The Petrel, a schooner yacht 30ft.x11.1ft., parted her moorings on July 13 and went ashore near Angola, proving a total wreck. Her crew were on shore at the time. The Petrel was built in Buffalo, where she was owned, in 1879.

QUAKER CITY Y. C.—A sweepstakes race has been arranged between the fourth class yachts Minerva, Adelphia, Elwell, T. J. Pratt, and Francis K. Pierson, to take place over the usual course from Market street wharf, Camden, around Chester Buoy and return.

SALEM BAY Y. C.—The matches of this club, postponed until July 17, were not sailed on that day, owing to a heavy thunder storm at the time of starting, so they were postponed for the third time, no date being set.

VIKING.—This steam yacht, built by Roach & Son in 1883, has been sold by her owner, Mr. G. S. Scott, to Mr. Samuel J. Tilden.

Canoeing.

CANOEISTS are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.

FIXTURES.

July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 15.—A. C. A. Meet, Grindstone Island.

WEIGHT OF CENTERBOARDS.

WHEREAS, The use of heavy centerboards has made it desirable to define the limit of weight at which it may be claimed a board is not used as ballast,

Resolved, That to be eligible for races without ballast, the centerboard, with case complete, should not exceed 15 pounds in weight.

The above resolution was unanimously agreed to at a regular meeting of the Mohican C. C. There are no heavy centerboards in the club, and none of the members use ballast; but an expression of opinion was made with a view to directing attention to an important subject. The captain or some other M. C. C. man will move as above at the next A. C. A. meet in order to put an end to the vague terms "light" and "heavy," as applied to boards, and for the guidance of future regatta committees.

The Mohicans recognize the heavy board as a legitimate appliance, and ballast as an advantageous aid under certain circumstances; but they like to keep their boats light, because they paddle as well as sail, they travel by rail and by steamer quite frequently, and they like to float in a few inches of water as they explore creeks and streams near home and rifts and rocky rivers away from home, and they like a buoyant boat, because they have lively squalls and pretty rough water, and not infrequen capsizes (which are, under the circumstances, very good fun).

And the Mohicans believe that quite a number of other canoeists agree with them. Therefore, they desire in their own club, and in the Association, to have races wherein the light all-round canoes can compete apart from racing sailboats, although they are not afraid to try conclusions with the veriest racing machines in any weather, in other races.

And this resolution is published in order that proper consideration may be given to the question before it is put to the vote.

[There would probably be some difficulty in limiting the weight of board and trunk, as the latter is a fixture in the canoe, and in many cases its weight, if not ascertained when building, could not be afterward determined. Would it not be best to limit weight of board only, as the board can, in almost all cases, be detached and weighed?]

ROYAL C. C. ANNUAL REGATTA—JUNE 28.

THE Royal C. C. were again favored with glorious weather for their interesting and popular annual meeting. The entries for the paddling races were not perhaps as numerous as on some previous occasions, but the events were for the most part hotly contested, and afforded considerable amusement to the spectators. The entries for the sailing race were good, and much interest was centered in Mr. Baden-Powell's new Nautilus. Unfortunately, however, he was unable to get a suit of sails made for her in time, and was therefore compelled to stand out from this event. In the running race, however, the new boat showed considerable speed, and won, after a good race with the old Pearl, now Violet. During the day the band of the H. A. C. performed a selection from their repertoire, and greatly aided to the enjoyment of the meeting. The results of the various events were as follows:

Half-mile paddling race, any canoes.—Claud Scott, 1; S. Futcher, 2. A splendid race, Futcher leading at the start, Scott passing him at the half distance, and winning by a bare five feet.

Paddling and sailing race; sail before wind, and paddle back.—A. B. Ingram, 1; J. V. Vesey-Fitzgerald, 2. Fitzgerald led in the run down, but got in a mess with his sails on rounding, Ingram winning easily.

Mile Paddling in Rob Roys.—Claud Scott, 1; P. Nisbet. Won anyhow, Nisbet giving up at half distance.

Half-mile double canoe race, lady and gentleman in each canoe.—F. W. Lewis-Farrar and lady, 1; P. Nisbet and lady; E. L. P. Nisbet and lady, 0. Won easily.

Sailing race, four times round.—T. F. Knowles, Gladys, 1; E. A. Leach, Wave, 2; W. Watney, Violet, 0; H. Church, Imogene, 0. Violet got away first, but was passed by Gladys. In the second round, however, Violet got away again and had a good lead, when her skipper got literally "up a tree," and extinguished his chance. Imogene got an unlucky puff, which nearly filled her, so the Wave was left to walk in for second place.

Mile paddling challenge cup.—M. A. Ord-Mackenzie, the holder, did not put in an appearance, and the race lay between Claud Scott and Futcher, the former winning, after a good race, by about three lengths. Both men steered miserably.

Sailing race, running only.—W. Baden-Powell, Nautilus, 1; W. Watney, Violet 2; J. Vesey Fitzgerald, Zoedone, 3; H. Church, Imogene, 0. The new Nautilus, with a small sail borrowed for the occasion, sailed a good race and won.

Four-paddle race.—Claud Scott, E. L. P. Nisbet, H. K. Bridger, P. Nisbet, 1; S. Futcher, W. E. Graham, G. V. Gaskell, A. B. Ingram, 0. A splendid race, the boats being neck-and neck all the way, Scott's crew just winning by half a length.

Chase over land and water.—P. Nisbet, 1; S. Futcher, 0. Futcher was first across the river, but hurried too much on getting his canoe out of the water and in again; Nisbet taking matters more coolly, got his canoe in right side up and won easily.

Scratch fours, half mile.—First heat; H. Davenport, G. V. Gaskell, W. O'Mally, and P. Hart 1; E. L. P. Nisbet, Carpenter, P. Nisbet, and W. Scott, 0. Won by three lengths.—Second heat: H. Tuppin, C. L. O'Mally, Chancellor, and Claud Scott, 1; G. J. B. Porter, E. Morley, H. Church and G. Ingram, 0.—Final heat: C. Scott's crew, 1; Davenport's crew 0. A splendid race, resulting in favor of Scott's crew by a length.—*London Field, July* 5.

CRUISING CANOES AND THE A. C. A. RULES.

SINCE the publication of the official programme of the annual races, the attention of canoeists generally has been drawn to a most important feature of the present racing rules, their influence on canoe models. It will be admitted without question that the main end in view in all canoe legislation is the encouragement of legitimate cruising, and to that end the development of the best possible model for general cruising work and the limitation of extreme types and racing machines.

The value of canoe races in the development and promotion of the sport is beyond dispute. They add greatly to the interest of canoeing. They can be held at all times, on any afternoon through the season, and so are open to many who cannot spare time for cruising. To their influence we owe many of the most valuable improvements in boats and gear, and they occupy deservedly a prominent place in our meets; but with them comes the necessity for fixed and carefully prepared rules. Even without racing some limit or definition of a canoe would be necessary, but to class the boats properly for the races is the first requisite. Those most interested in such work would naturally be racing men, and the chances are that in their eagerness to provide sport for all they will forget the medium boats and favor the racers, both sailing and paddling.

In criticising any set of rules, the test question is, "What is their influence on canoe models," or what classes of canoes will be built under them, and in connection with this, it must be considered that the records of all sports prove, that where a limit is set, competition will always force the contestants to build up to it in time.

The history of the present rules is known to all canoeists; in 1881 a committee of three was appointed by the A. C. A. to draw up rules and sailing regulations; their work was submitted to seven other canoeists, representatives of various clubs, and the work amended in accordance with their suggestions, after which the rules were distributed among canoeists for their opinions, before being finally submitted to the Association and being adopted. After a limited trial in one regatta, the regatta committee of 1882 and 3 rejected them, in favor of those at present in use, which have thus far had also one season's trial.

In the former rules, every canoe was placed definitely in a fixed class, according to its leading dimensions, races being arranged for that class, both paddling and sailing, the consequence being that the same boats came together in each race, and if one improved his advantages as a sailing boat by an undue sacrifice of paddling requisites, he paid for it by being at a disadvantage in paddling, and vice versa. Of course there will always be some boats difficult to place in any one class under any rules, but the difficulties arising under the former rules, owing to diversity of size, there never having been any standard or limit previously, would disappear in a few seasons, as the rules were built up to. The new rules were based on an entirely different plan, the primary distinction being sailing canoes, and paddling canoes, or two totally distinct classes, the limit of size for each being widely different. The immediate tendency of such a rule is evidently to develop special boats, some fast under paddle, and others only fast for sailing, and while one year is hardly long enough to test the matter conclusively, the coming meet will probably prove the truth of the above, by bringing out boats built to the limit in one class, but useless in the other, such boats of course taking the prizes, to the exclusion of the all-round canoe.

For instance, taking a canoe of 14×28, it is called upon to paddle against a canoe of 17×28, a handicap of 3ft. in favor of he latter boat, certainly an immense advantage, other things being equal. In sailing it is brought against a boat 16×28, or 2ft. against it. The smaller or Rob Roys, 26in., must paddle against a boat 2ft. longer, and their only chance for a sailing race is with a canoe 16×28, in which their chances are decidedly poor. The 14×30 canoes must also give 2ft. of length, and even then there is but one paddling race that they can enter, while in sailing, in the three races they can enter they are heavily handicapped. The entire pressure of the rules then, is to boats either 16×28in. or 16×30, both of which sizes are but little used, and by the general practice of canoeists are far from the best, and while, at present, the small intrinsic value of the prizes makes the pressure comparatively light, as races increase in the clubs, as they are rapidly doing, canoes of other dimensions must withdraw almost entirely from them.

It will be easier to say after the present season how far this evil will extend, but we would call the attention of all canoeists to the rules, as worthy of their most careful consideration, with a view to their improvement. One of the first requisites of a measurement rule is stability, that it should remain as far as possible unchanged, in order that boats built under it may not be outclassed in a year or so, and we would not advise another ill-considered and radical change, but a careful effort on the part of all for the removal of the present difficulties.

THE A. C. A. RACES.

Editor Forest and Stream;

Mr. Whitlock's letter and the editorial note following it give a different aspect to the programme question, but there is still an uncertainty about some points. First let me say that the Mohican resolutions were prompted by the programme published in FOREST AND STREAM, which Mr. Whitlock has declared incorrect, but which was nearly the same as a proof which he offered for my perusal some time previous, and against which I protested, without effect, as I supposed, since the chairman of the Regatta Committee wrote to me unfavorably and then published a letter defending outside ballast (which Mr. Tyson has ably met). Therefore we had every reason to believe that the programme in FOREST AND STREAM was authentic. But referring to *Canoeist*, I find:

12. Sailing light race, 3 P. M., 1½ miles
(*a*) Canoes without ballast.
(*b*) Canoes with heavy board only.

I infer from Mr. Whitlock's last letter that the *a* and *b* do not refer to classes. The use of these letters is somewhat misleading, therefore, but this does not matter much if it is clearly explained.

But the next inference (or rather consequence) is that in light races Classes A and B are to compete together, in fact, Mr. Whitlock writes that in that race, "which has always been for any canoe, the divisions into A and B classes becomes unnecessary." Now, referring to the no ballast race in last year's programme, I find classes A and B mentioned, and I remember that, although sailed together, they were separate races with separate prizes, and it seems to me that the idea of cutting down the programme is not furthered by adding a light race for canoes with heavy racing appliances, if it has to be done by crowding the real light boats into a single race where Class A boats have no chance against their bigger opponents. It simply alters our complaint that there was no light race for Class B to one that there is none for Class A, and as I have not, from the commencement of this discussion, wished to obtain advantages for my own boat but have only asked for an equitable arrangement, I think the situation is not improved.

Only one Class A Mohican canoe is likely to be at the next meet, the Marion, and it was her owner who offered the resolution petitioning in favor of Class B. Now it is her turn to be advocated. She was proved at Newburgh to be a good boat and skillfully commanded, yet it is well known that against three inches more beam she has no chance worth speaking of, and that too, in her proper and favorite trim of no ballast. There are many canoes of the same type; I speak of the Marion only as an instance of her class.

It seems to me to be evident without argument that each of the classes, A and B, should have a race without ballast. I think they were the most valuable races on the programme and the ones most likely to encourage good canoeing in fair boats not over-rigged. At the same time I personally, and the Mohicans as a club, are sorry to be thus at variance with the chairman of the Regatta Committee, knowing how able and beneficial his previous services to the A. C. A. have been. For my part I would withdraw everything and say no more rather than assume the responsibility of being a useless critic. I commenced as a petitioner, circumstances have since put me in the attitude of a critic. I have no more to say on this question unless it is the opinion of the A. C. A. that enough is not yet said.

ROBERT W. GIBSON.

[As stated last week, the error alluded to was in the original copy sent to us by the Regatta Committee. It would be very easy to divide the canoes in the first division of race No. 12 into A and B classes, starting all together, of course. The main difficulty, as we have pointed out elsewhere, lies in the basis of the present rules.]

THE LOG BOOK.

IX.—A CRUISE ON THE MERRIMACK.

LEAVING Salem by the first train on the Fourth of July, the canoe Joie started for a cruise down the Merrimack, from Lawrence and through to Ipswich. The Joie is a canvas canoe of the Rob Roy style, decked over, and is a home-made craft. Leaving the canoe at North Andover, being nearer the river than Lawrence, I went into the city, my object being to see if I could get a friend, who is a canoeist of some note, to accompany me a short distance down the river; but on reaching his house I learned that he had left early in the morning to go up the river, so I returned to North Andover alone.

With a little assistance I got the canoe into the water and started down the river. There was a slight breeze up the river, so the crew was obliged to take to the paddle. Moving slowly down, and stopping occasionally to go ashore, it was nearly noon before the Joie reached St. Mitchel's Falls, which she ran in safety luckily, as they were her first rapids. A short distance below I met a couple of boats, whose occupants were camping further down for the day. They kindly invited me to stop and take dinner with them, which invitation I accepted, and remained there until 3 o'clock, when, bidding them good-by, I continued on my journey.

Passing by Haverhill and Groveland, I reached a good camping ground about a mile and a half or two miles below Groveland bridge on the right hand side of the river. It is around a curve that hides a picnic ground below the bridge from sight, on a grassy bank amid a large group of trees. There is plenty of wood and a farmhouse near by, where you can obtain milk, etc. Landing there I pulled the Joie on the bank and put up my canoe tent and prepared for the night. About eleven o'clock I was awakened by the sound of rain on the tent, but as that was waterproof it did not trouble me. It rained until seven o'clock the next morning, so the Joie did not get started until nine.

During the night the wind had shifted and was blowing down the river, so I hoisted my two "legs of mutton" sails and bid my friends of the farmhouse good-bye, and the Joie bore away down the river for Newburyport.

She had a hard struggle through Rock's bridge, as the tide was running up strong, but she made it all right at last; at Amesbury the wind died away and she finished the distance to Newburyport under a "spruce breeze."

The crew stopped there awhile for luncheon and tried to get some information concerning Plum Island River, which he did not understand very well. Leaving there under full sail again, the Joie sailed down nearly to Woodbridge Island, where I asked some men if that was Plum Island River; they told me it was, so I started through. The tide was running out strong and the water was getting shallow, but supposing that the channel was just ahead I kept on until the Joie was high and dry on the mud flats about three-quarters of a mile from either shore. A man who was shooting told me that the tide would not be in until six o'clock, so I propped the canoe up on the mud and took a nap and read until the tide rose.

At a quarter past 9 o'clock I started for Ipswich Little Neck. There

was a strong current and wind against me through the river, and so I was obliged to paddle. On reaching the Sound I was completely lost, having no landmarks to steer by, for it was dark and the wind was blowing hard. At last, seeing a light inshore, I decided to paddle for it and learn where I was. On reaching it and finding a beach, I went ashore and learned that I was up Parker River.

As it was then about 9 o'clock I decided not to go any further that night, and on being offered a bunk in a small shanty, I accepted and passed the night there. In the morning, after a hearty breakfast in a cottage, the Joie started for the Little Neck again. There was a stiff breeze blowing against her, so the crew were obliged to paddle across. It was a hard, wet struggle, but the Neck was reached at last, and there the Joie stayed until the next morning. I met some Salem friends and remained there that night.

In the morning I paddled up to Ipswich and took the train for Beverly, where I put the canoe overboard again and paddled up to the wharf, reaching it at 10 o'clock in safety. Thus ended my first cruise, but I hope not the last. JOIE.

CRUISING NOTES.—Messrs. J. L. Greenleaf, Knickerbocker C. C., Frank J. Proctor and A. G. Webster, Harvard C. C., called at this place (Newburgh) July 17, Mr. Greenleaf being on a cruise to Albany and the Messrs. Proctor and Webster en route to the Lake George C. C. meet at Lake George and the A. C. A. meet at Grindstone.—PIXIE.

Dr. Neidé and Mr. Newman reached Plattsburg on July 9, Rouse's Point, 10th, and crossed by rail to Ogdensburg on the 11th, starting up the St. Lawrence on the 12th. For two days progress was very slow against wind and current, while rain at intervals made matters worse. On Monday the wind came from the east, so an early start was made, the remaining run of nearly thirty miles being made in five hours, before the wind, both canoeists being soaked with spray. The wind changed back again just after their arrival in camp. Dr. Neidé is now hard at work on the island, and reports that he cannot hire any help. There are, no doubt, plenty of canoeists who have time to spend an extra week in camp, and a little help from some of them now will be very acceptable.

CANOEING IN PITTSBURGH.—Canoeing is rapidly becoming more popular in Pittsburgh, and aside from three perfectly organized and equipped canoe clubs, every urchin and street gamin that enjoys a love for aquatic sport, has drawn upon his limited amount of genius, and converted an indescribable mass of driftwood into a canoe shaped "something," which he paddles to and fro with a broken oar, or a piece of board, with all the pride and satisfaction of the commander of the finest lapstreak.—C. A. R.

CANOE PHOTOS.—We have received from Mr. F. H. Pullen, two handsome photos of the Merrimack River meet.

A NEW NAUTILUS CANOE.—Mr. Baden-Powell has just completed a new Nautilus canoe for cruising and occasional racing, and will "trial trip" her in the regatta races of the Royal C. C. to-day at Teddington. As regards model, she looks "twelf;" there is not a hollow line in her. She has a considerable rise of floor, with a raking midship section, and a long, fine "run." Her designer's aim is to create a craft which, under light spars, and with only stores for ballast (in addition to a cruising centerplate) shall paddle easily, sail well, and at the same time afford sleeping accommodation, and yet not be too heavy for her crew to haul about on shore. These qualities from the look of her, will no doubt be attained; and, further, when ballasted, sparred, and "plated" for a race, she should cause a flutter among the bashful ones of the racing fleet. Her leading dimensions are, length 15ft., beam 2ft. 7½in., depth 16in. There are several novel features about her—notably, in that she has two complete watertight bulkheads, which prevent any possibility of a wash of water fore and aft in the event of shipping a sea, or filling the cockpit in a squall, the fore and aft compartments being got at by means of deck hatchways, instead of bulkhead doors. The after end of the "twelf" is so arranged as to seat a passenger for short trips, and forms, when not so used, a comfortable head and shoulder rest for her skipper when sailing. She has no side deck flaps, but is so constructed that the skipper can lie down at full length under the side deck and steer with his feet. Her sheer and general appearance are very taking to the eye, and suggest good sea-going qualities. Her own sails are not yet ready. However, an old suit is being fitted to her for the regatta; but even then her owner will have all his work cut out to get her fitted by the time of the first race. She has been put together in little more than a fortnight by the able R. C. C. builder, Mr. Turk, of Kingston, and shows considerable excellence in material and workmanship. The Nautilus will compete in the cruiser race and in both the sailing races to-day at the R. C. C. regatta at Teddington.—*London Field, June 28.*

OSHKOSH C. C. ANNUAL RACES.—The Oshkosh C. C. held their first annual races on Wednesday, July 16. The course was three miles triangular, the wind very light from the East. The start was made at 3 P. M., the following boats crossing: Aloka, W. J. McCoy; Alice, Otto Schloerb; Sis, A. M. Von Kaas; Reine, W. A. Session; Meta, Oscar Timm; Bon Ami, R. P. Finney; Dollie R., W. A. Radford, and Jen, Wm. Brand. The race was very slow owing to the lack of wind, Bon Ami winning in 1:28:20, with Jen, Lis and Reine following. Afterward a scrub race was sailed, in which Alice was first, Reine second, and Aloka third. Bon Ami takes the champion flag for the balance of the year, and holds the challenge prize until won by another boat.

SEAWANHAKA C. Y. C. RACE FOR CANOES.—The annual open boat races of the Seawanhaka C. Y. C., on July 30, will be open to canoes of all recognized canoe clubs, a prize valued at $30 being given. The conditions are given in our yachting columns.

ANSWERS TO CORRESPONDENTS.

NED, Allegany.—See our last issue for fish seasons.

N. J. O., Blairsville, Pa.—The gun has a good reputation.

C. C. M.—Please give me the names of five or six most important flies for trout fishing in the Adirondacks the first of August. Ans. Coachman, Professor, Red Spinner, Montreal, Red Ibis, and Queen of the Water.

J. T. G., Keyport, N. Y.—1. You can carry 50ft. in mainsail and 20ft. in mizzen, for moderate cruising rig. 2. Step mainmast 2ft. 6in. from bow, mizzen 2ft. 9in. from stern. 3. Write to C. A. Neidé, Schuylerville, N. Y.

X. Y. Z.—In an ash and lancewood, 7-ounce, three-joint fly-rod should the middle joint be of ash or lancewood? Ans. It is largely a matter of taste. Lancewood is heavier than ash, and the latter is generally used. This would be our choice.

PITTICUS—Will you kindly inform me (1) if the fishing in Lake Ronkonkoma, L. I., is good enough to warrant going there for a week? 2. Are there any fish in the lake which are forbidden to be caught? 3. Could I camp out there? Ans. The fishing is fair there but at times is overdone. 2. No. 3. Yes.

J. L. L.—What varnish is best to use in revarnishing a split bamboo rod, and I would also be obliged for any other points as to keeping a rod of that kind in good condition. Ans. Shellac dissolved in alcohol. Keep the rod well varnished and do not tie it too tightly in the case. Let it lie down instead of standing.

GRAYLING.—1. Where is the best fishing among the Thousand Islands, especially near Kingston? 2. At what date does duck shooting commence? Ans. 1. Inside of Howe Island, and between that and Grindstone on the east. South between Wolfe Island and Cape Vincent. 2. On the Canada side Aug. 15. New York side Sept. 1.

AMATEUR, Paterson, N. J.—1. How is the silk prepared for tying guides on a fishing rod? 2. What is the best wood for the butt of a light trout rod, the wood to be light and of sufficient strength? Ans. 1. No preparation is necessary; take silk thread and wind it around the guides and finish with an invisible knot. 2. Ash is commonly used and is as good as any if tough and close grained.

EWOR.—Can you inform me what is the togue, its scientific name and habitat; also the best work on ichthyology? Ans. Togue is merely a local name for the fish otherwise known as lake trout, salmon trout, etc. (*Salvelinus namaycush*). Get Synopsys of N. A. Fishes, by Jordan and Gilbert, Bulletin 16 of the U. S. National Museum. It may be difficult to obtain now. You can get Jordan's "Manual of the Vertebrates" from Jansen, McClurg & Co., Chicago, for $3.

HUMPHREYS HOMEOPATHIC MED. CO.
109 Fulton Street, New York.

"MIST COLOR" LEADERS.

Being consumers of nearly three-fourths of the total amount of silk worm gut imported in this country, and having in Murcia, Spain, increased our facilities for the manufacture of silk worm gut, we are enabled to secure a selection of material for our leaders beyond what even we have ever had. The leader being one of the most important articles in an angler's outfit, we have long given particular attention not only to the material of which it is composed, but also to the manner of making or tying it. *All of our leaders have a place every three feet, made quadruple by looping, so that the flies can be easily adjusted and will not wear the leader unnecessarily. All of our leaders are "Mist Colored."* Every envelope contains one dozen leaders; has our name and trade mark on it; states the length and quality of the leaders in it.

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for our 120-page illustrated catalogue.

Harrison's Celebrated Fish Hook.
Registered.

Trade  Mark.

Whereas, It having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and **we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours,** which are to be obtained from the most respectable wholesale houses in the trade.

Signed, **R. HARRISON, BARTLEET & CO.,**

Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S
Patent "Perfect" Brass Shells,
MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

A RARE CHANCE!

The American Arms Co., manufacturers of the Fox patent double guns, are now running their entire gun machinery on the single semi-hammerless guns and their new double-action extracting pistols, and will make no more double guns at present, except on orders, at full prices. The undersigned, having purchased all their stock of Fox guns, some 300 in all, of the various grades, No. 5 list and above, will offer them to sportsmen—"first come, first serve"—at 25 per cent. discount from the regular list while they last. Here is an opportunity to purchase a fine gun at an unprecedentedly low price. They are all warranted of the finest qualities in every respect, and cannot be duplicated when this lot is exhausted.

Orders may be sent as usual to the **AMERICAN ARMS CO., or to F. H. RAYMOND, Treasurer, 103 Milk Street, Boston** Will be sent C. O. D. for trial and examination.
